Among Our Neighbors

H. M. ANDERSON,
York County, Pa.

N.J. Agr.

The story of the organization and effective development of the Norrisville Farmers' Club, in lower York County, Pennsylvania, was told in these columns some months ago. The question is asked if such a club is possible in every agricultural community. The answer must be that the success of local organizations, as indeed, the standard of farming in local communities, depends to a very large degree upon the character and quality of the local leaders.

The Anderson family has long been closely identified with the activities of the Norrisville Farmers' Club, and thru it, with the development of agriculture in southern York County. Several generations and various branches of Anderson geneology have contributed to the transformation of what was once known as the York County barrens into one of the most progressive and uniformly prosperous farming sections of the state. They were compelled to follow constructive methods from the start. The soil was naturally unproductive, and the system of farming followed had to be such as would care for immediate needs and build for the future. This is what is designated as permanent agriculture, and there are many useful lessons to be learned from the methods here followed.

One of the foremost of the present generation of leaders is Mr. H. M. Anderson. He is well known to the farmers of many sections of this state as an institute speaker who has an intensely interesting story of soil building and constructive farming to tell. A visit to his farm and a first-hand inspection of the many interesting features to be found there, add to the weight of his institute story. Mr. Anderson occupies a farm that has been in the family since 1851, having purchased it from his father a few years ago. The records of the early transfers of the farm are of interest as showing the struggles which the early farmers met in gaining a foothold. These records show that the farm was frequently sold at sheriff's sale in those early years at remarkably low prices. The court records give the transfer prices in dollars and cents, and on one occasion the cents were shown to out-number the dollars.

FARM HOME OF MR. H. M. ANDERSON, YORK CO., PA.

The farm at the present time contains 125 acres, with about 110 acres under cultivation. General farming is practiced. Corn, alfalfa and clover are the main forage crops. These are fed to steers, hogs and mules, and the manure goes back onto the farm. Potatoes, tomatoes and sometimes cabbage are the principal money crops; tobacco having been dropped. Soy beans, grown for seed or silage, have been an important crop in some past years. The lure of the Stayman Winesap is now being felt, however, and a departure from general farming is being made, with a view to gradually turning the farm over to apple production.

The general plan followed except where orchards or alfalfa have been introduced, is a five year rotation of corn, potatoes and usually ensilage corn, wheat and two years in meadow. The past season there were 24 acres of corn, showing a magnificent growth at the time of our visit (August 15) but being injured somewhat by drouth when the ears were setting. The dry weather continued as the crop was maturing, but the yield averaged about 65 bushels of shelled corn per acre, which is the poorest crop he has ever grown. Crimson clover is sown in the corn at the time of last cultivation, to secure a cover crop thru the winter and to be turned under the following spring. This practice has been an important one in maintaining and improving the fertility of the soil. The corn being fed on the farm and the manure returned to the land, the large acreage in this crop fits in well with the plan of soil building.

THE BARN ON THE ANDERSON FARM, LOOKING DOWN A ROW OF THE PEACH ORCHARD SET IN DECEMBER, 1913.
The Potatoes Interplanted in this Orchard gave 225 Bushels Per Acre the Past Season.

Mr. Anderson, like most of his neighbors, has come to the conclusion that oats are an unprofitable crop in his section. Accordingly the oats were dropped from the rotation some years ago and potatoes substituted. The location of a new canning factory in the community the past year opened the possibility of bringing tomatoes into the rotation, and these were tried out for the first time this year; partially as an experiment and in comparison with potatoes. Five acres of tomatoes were set out, the varieties being Burpees. Success and Greater Baltimore. These were grown at a contract price of 28 cents per bushel of 60 pounds. A splendid growth was secured, but the dry weather the latter part of the season cut the yield somewhat. The crop gave 380 bushels per acre. They will be grown again next year.

The potato acreage was cut short to make room for the tomatoes but a sufficient number were planted to continue a variety test which has been in progress for sometime. The Late Petoskey, American Giant and Bird's Success have given returns and are being retained as best varieties for local conditions. Of these, the Late Petoskey gave the best yields last year (1912), having produced 220 bushels per acre. Past seasons, under favorable conditions the crops have averaged 200, 250 and once 300 bushels per acre. Unless tomatoes prove to be as profitable, both in point of money returns and labor costs, they will be dropped and potatoes put back in the rotation.

One sight that is certain to catch the eye of the traveler over the "farmers' railroad" from Stewartstown to Fawn Grove is Mr. Anderson's alfalfa field. He has 11 acres in two seedings of seven and four acres. The seven acre field was in its third year the past season, and it cut a total of 20 tons of alfalfa hay of very fine quality in spite of the dry season. It was as even a stand as could be found and remarkably free from weeds. The smaller field is a new seeding but gives promise of equaling the older meadow in productivity. The alfalfa has revolutionized the feeding business on this farm. With corn for silage and grain, and alfalfa for forage, the only purchased feed for steer feeding is cottonseed meal.

As has been said, Mr. Anderson is enlarging his apple orchards as rapidly as possible. This change in the farm system is due partially to the general popularity and success of the Staymen Winesap apples in all of that section of the county, but more specifically to the results obtained from his five-acre orchard of eight-year-old trees. This orchard was planted 20 by 36 feet, with York Imperials as fillers, to be removed before the trees reach full growth, leaving the matured trees 36 by 40 feet. Another orchard of 13½ acres was planted three years ago, following the same plan of planting. In the new orchard there are 500 Stayman Winesap trees, 200 York Imperials and 100 Grimes Golden; the two latter being planted as fillers. There is also a five-acre orchard of 9 and 10-year-old trees where the York Imperial is the standard and Ben Davis and Rome Beauty, etc., are fillers. The illustration on this page shows Mr. Anderson sizing up one of his three-year-old Stayman trees. It also shows the type of tree he is growing and his method of pruning to secure low, open tops.

But the fields and orchards show but half the story on this farm. The 57 by 72-foot barn shown on first page is the factory in which the forage crops are converted into beef and pork. The barn is 20 feet to the square and provides abundant storage room for hay and grain. At the time of our visit it contained 25 tons of alfalfa for this winter's feeding and 46½ tons of timothy hay for sale. A silo completes the storage outfit. It is of a home-built type, having green white-oak bands bent inside and outside of the studding and finished in side and out with yellow pine flooring. It is 30 feet high and 16 feet in diameter. It was the first silo to be built in the community, and is still in a splendid state of preservation after storing 17 successive crops. At one time a dairy herd was kept but dairying was not a congenial occupation and milk prices were so low that the herd was disposed of. The silo, however, has proved to be as valuable in steer feeding as in dairy work and is considered one of the best investments ever made on the farm.

About 15 or 20 steers are bought every fall to be fed thru the winter. Their ration consists of alfalfa hay, silage, fodder, corn meal and a little cottonseed meal. As nothing is purchased but the cottonseed, there is little money going out for feed and in several years of this practice the steers have not failed to pay good market price for the home-grown materials. Feeding usually starts about the first of October with steers of, preferably, about 800 pounds weight, usually purchased from a local dealer. Last year 12 steers were bought October 10, weighing 850 pounds. They were sold February 10, by which time they had made an average gain in weight of 304 pounds. Another lot of eight steers was put on in February and fed thru until May 1, making corresponding gains.

There is very little soil fertility being sold off the farm under this system of management. The barn is of the familiar over-hanging type, which gives a covered run for the steers and protects the manure which accumulates. Here the manure is stored thru the winter months if it is impossible to get it onto the fields, and with the tramping of the stock there is practically no loss from evaporation or leaching; the plan however is to haul it every week or at most two or three weeks when the fields are in condition to receive it. Manure is top-dressed on the clover meadows for the benefit of the succeeding timothy so far as possible. The rest is spread on the timothy sod to be plowed under for corn.

MR. H. M. ANDERSON SIZING UP ONE OF HIS STAYMAN WINESAP TREES.
Sweet Corn in Background. Note Low Open Head on Tree.

Another profitable line of feeding is with mules. Mr. Anderson buys mule colts at the weaning age, usually at about $80 to $90 each. These are put on pasture in summer and fed thru the winter. He begins working them at two years of age, from which time they will pay for their feed and keep. When they are three years old, they are trained and matched up as teams, and they then sell readily at from $300 to $500 per team. Mules are expected to do practically all of the team work on the farm in the future. The team of coming four-year-olds, shown at the watering trough in the covered yard, could not be purchased at $500.

A new 16 by 42 foot hog house with floor above for storage of feed, etc., is a part of the farm equipment. The hogs fed are the progeny of sows kept on the farm; usually three or four which are bred spring and fall. The aim is to never sell shotes, and they are seldom bought. These hogs are fed until they weigh 200 to 250 pounds, and are then sold direct to near-by butchers. Corn is used exclusively as a fattening grain, but while the pigs are growing their corn is supplemented with alfalfa hay, which they eat readily, and shorts and tankage. The tankage is never used alone, as the pigs do not eat it readily in that way.

Soy beans have been grown on this farm at different times with success and profit, altho they have never been made a regular part of the rotation. They were grown primarily for seed, the yields ranging from 15 to 20 bushels per acre, which sold at $2 to $2.50 per bushel. Soy bean hay has also been used profitably as a supplement to corn in silage. When used for this purpose, the beans were cut with a binder and a small load cut into the silo between loads of corn. At such time both corn and beans were put into the silo in slanting layers, to give a better distribution when the silage was taken out on a level surface. Tobacco was once grown regularly on the farm, but has been permanently dropped; not because of any uncertainty as to yields, but because of the practical certainty of unprofitable returns.

Taken as a whole, as well as in individual crops or features, this farm shows a well-ordered, systematic plan of management in which each department interweaves with all others to give a well-balanced general plant. It is a system that is paying good annual profits and at the same time is building for the future in increased fertility and enlarged productiveness. It is a splendid example of maintaining and increasing the bank account of soil fertility while drawing for current needs and annual dividends.

But farming is more than a business of producing crops and making money. It is a scheme of life in which the home as well as the social and community activities are essential factors. With all of the honest pride which Mr. Anderson may justly feel in his work as a farm manager and operator, his measure as a man and a citizen is in the home and the activities centering about it. The cozy, comfortable dwelling, which can be but inadequately shown in the illustration because of the fine old trees sheltering it, is almost a model in its equipment. It completely disproves the old idea that a farmer must move to the city to enjoy convenience and comfort in the home. It is heated with steam, has a pressure tank water system which supplies hot and cold water to both floors, and is lighted with acetylene gas. A low-power gasoline engine pumps water to the pressure tank as well as to the barn troughs and does other light-power work. The house is located on a rise of ground which gives a beautiful view over many miles of surrounding country. With a comfortable, five-passenger automobile for pleasure as well as utility purposes, the family is within easy reach of railroad stations and markets, and has every convenience and comfort that can be enjoyed in a city home, and many others that money could not buy in any city.

One room in the house is fitted up as a combination office and library, in which are to be found a good selection of magazines and other periodicals, as well as a collection of the best books. Here Mr. Anderson has his desk where are kept not only the records of his farm, but records and papers pertaining to his many club and community duties, in all of which he is busy in official capacity.

Presiding over this home is Mrs. Anderson, a charming "country-minded" woman, in close sympathetic touch with every activity of the farm and enthusiastic in her loyalty to farm life. Two sturdy little girls, four and two years of age, complete the happy family circle. Around those girls are being built the plans for the future and in them is found the best incentive for the rounding out of a perfect life and the hope of the best things in life.—A. J. A.

POTATO GROWING IMPROVES SOIL PRODUCTIVITY

German farmers have found that many indirect benefits result from potato culture, thru modern methods of crop rotation, green manuring and fertilizing. In a recently issued bulletin entitled "Lessons For American Potato Growers from German Experiences," the specialist of the Department of Agriculture describes among other things how Eastern Germany benefits from the cultivation of the potato.

The potato has played the greatest role in the agricultural development of light and fertile soils of this region, as the sugar beet has done in heavier soils. According to German specialists, these hoed root crops are beneficial to any soil, thru the deep and thoro culture that is given them, with its resultant improvement in the physical condition and aeration.

The profits from the crop justify the liberal use of commercial fertilizers, from which there are important residual effects on other crops in the rotation. The clean culture practiced also brings all weeds into thoro subjection. The yields per acre of all farm crops have been greatly increased since the extension of potato growing. Potato tops are now dried and used for stock food on many estates. The by-product, mash, resulting from the distillation of potatoes into alcohol is also an important economical factor.

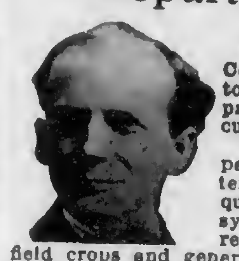
Farm Counselor Department



By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

What Did The New Year Bring You?

There is a sense of satisfaction in finding a balance on the right side of the ledger when, on the first of the year we compare our goods and moneys with what we had on last New Year's Day. But our taking of stock is not complete if we stop at listing and comparing our material things. How do you as an individual compare with last New Year's self?

Are you wiser, better, stronger in every way? Is your home, of which you are a part, a better home? Do you have a sense of fuller harmony with nature? Have your sorrows and disappointments, your successes and failures, strengthened or have they weakened your faith in God and man? Are you more optimistic, more agreeable, more charitable? Can you laugh as readily and forgive as easily? Have your experiences made you richer in the things worth while, so that you look forward with confidence as you stand on the threshold of the new year?

A TEAM OF MULES ON THE ANDERSON FARM, COMING FOUR YEARS OLD, THAT CANNOT BE BOUGHT FOR $500.

If not, why not? May it not be because the viewpoint has been wrong? If that is true, would it not be wise to change it; to look upon life as an opportunity to give and to serve; to give out, and not absorb only? They who uninterruptedly prosper in selfish ambitions often crawl out of life backwards, disappointed and dwarfed. Take account of stock, but do it honestly and fairly.

Wild Grass and Dodder Pests

C. P. D., New York, writes: "We have a field of 15 acres that is hard to seed. It will grow potatoes or grain very well, except that a short fine grass, and what is here called, devil's-gut, seem to crowd grain and grass out. Would sweet clover be good to sow on this piece? We have the ground plowed this fall. What time would you sow it? Would you sow it in grain and plow in the following year, or sow alone and plow in the fall or following spring? We want to plow down some crop to fit for potatoes. It is dry, level land, partly gravel"

The "short fine grass" is evidently a natural or wild grass, one of the many varieties that will flourish on land that needs lime before desirable grasses will grow. Our correspondent does not say whether lime has been applied to this field or not, but the indications are that an application of lime is needed to make the land so friendly to desired grasses that the wild grass can not grow.

The "devil's-gut" is a species of dodder, a parasitic plant; vining out and living on other plants. As this field seems to be badly infested with this pest the only practical method to pursue is to not sow or plant anything in the field next summer, but keep it harrowed, thoroly killing the weed out as fast as it appears. I would suggest an application of lime in the spring, keep harrowed until September 1st, then seed to rye and winter vetch, sowing about three pecks of vetch seed and six pecks of rye per acre. Plow this down the following spring when rye is 12 or 15 inches high, and plant potatoes. Thoro cultivation of potatoes will still further tend to eradicate the pests. It is possible that artificial inoculation of vetch seed would be advisable.

Nitrogen for Corn

H. C. K., Liverpool, writes: "I have a field that in 1912 had a heavy growth of alsike and red clover. A crop of hay was cut. This was followed by a second crop, almost equaling the first crop. The season of 1913, another crop of hay was cut. There is a heavy sod on it now which is being turned down for corn. Is there any nitrogen left in the soil from the clover? Again, what analysis of fertilizer should be used on the field for a crop of corn? The field is in a fair state of fertility."

From this description, it would seem that only one thing more would be desirable to make this an ideal field for corn; that would be to have applied a coat of manure immediately after the hay was harvested. Without doubt there is a large part of the nitrogen gathered by the clover left in the soil in the undecayed roots and stubble. But since this will not be available in any great amount until hot weather comes, it is advisable, in the absence of manure, to apply some in a soluble form to start the plants. Also, as it is scarcely ever an error in treating Pennsylvania soils to prescribe phosphoric acid, and often potash, I will write the following long-range prescription: Nitrogen, 1½ percent.; phosphoric acid, 8 percent.; potash, 5 percent. Drill in row 150 lbs. per acre, or, what is still better, sow or drill broadcast 300 lbs. per acre.

Ashes and Salt

"I have five tons of wood ashes, hickory and sugar, and can get more. They are all dry, direct from the wholesale pork packers. I can also get the same amount of salt that went thru pork curing process. Please inform me for what crops ashes and salt are suitable and how much to use, drilled or broadcast. Are the wood ashes good to drill in with corn or any other grain? My soil is a deep sand loam, well limed and manured.—H. J. R., Butler Co., Pa."

Hardwood ashes, such as these, have a fertilizer value of from $6.50 to $7.50 per ton when compared with equal amounts of plant food and lime in other materials; altho they do seem to bring greater results, than does lime phosphoric acid and potash from purely mineral sources. Why this is so is hard to tell. The salt has little or no agricultural value. The inquirer will get greatest returns by broad-casting the ashes on grain or grass, and especially on newly-seeded clover fields, three or four hundred pounds per acre. They are also valuable for use on any kind of fruit soil, either tree or bush fruits. Ashes should not be drilled in corn-rows.

AGRICULTURE AS A STUDY

"My boy is going to start to the Agricultural College at ———, next week," remarked one of our seemingly most prosperous farmers a few months ago. "You see I have come to the place where I do not know what to do. The old farm is getting worn out. I know in a general way that lime and manure will do it no harm; but there are too many problems which I have no idea how to solve. And so I'm going to send John to college, and let him find out."

This is quite the opposite course from a generation or two ago, when it was deemed that the farmer needed to know about as little as any one,—providing only that he knew how to drive and feed a team and to manage the ordinary farm machinery. Schooling was for him quite a superfluous article after he had passed fractions.

The growing impetus along agricultural lines is one of the most hopeful signs of the times. All over this country there is a fast growing demand for agricultural teaching. A young man who has prepared especially along biological lines reports ten applications for the practical agriculturist to one for the biologist. The food supply is a question of national import; and the man who furnishes this food is bound to be the coming man. Every eye is turned to the methods which will produce two blades of grass where one formerly grew; which will make this orchard more productive; which will come to the front with a higher grade of stock. We hear much of soil foods, and in our own minds we are convinced that the abandoned farms will in another generation be reclaimed, and prove the richest inheritance. Science reconnoitered for years, getting her bearings; but now she has found them and is settling down to a practical basis. The farm boy who cannot go to college is getting a course in agriculture in the public schools; but many farmers are awakening to the fact that they cannot hope to compete in this age without placing at least one boy in an agricultural college. And he will return ready to solve the problems in a practical way.—Bessie L. Putnam, Crawford Co., Pa.

PRIZES PAPER VERY HIGHLY

Enclosed please find order blank for two suscribers for your farm paper which we prize very highly.—E. C. Davis, Rockville, N. Y.

Someihing New!

This offer is made by the Lake County Land Owners' Association in order to secure new settlers and to develop the district.

We Will Take Your First Crop
In Full Payment for the Land
Regardless of the size or value of the crop, and without any cash payment to us on your part whatsoever.

We have very little money to spend for advertising, but we know what our land will produce, and we will give a new settler 10 acres and take his first crop of watermelons in full payment for same.

This crop can be produced at small expense and is marketed within a few months. We take only the *first* crop. You can raise other crops for yourself the same year.

Our lands lie on either side of three hard roads and two railroads, with 12 stations, including five towns and one city; they are high, rolling, well drained, with beautiful clear water lakes and beautiful homes throughout district; elevation over 100 feet, ideal climate and pure drinking water. No better grapefruit or orange land on the continent. Over one million boxes of fruit shipped from this part of state last year. Modern packing houses.

Our growers make big money out of tomatoes, syrup cane, winter vegetables, staple crops and watermelons, which are shipped in solid train loads; 62 spot cash buyers here one day last season.

Come now and pick out your land while prices are low. Our land is selling at $35 an acre and up on easy terms. You can have it planted on shares or set out to grapefruit, which bears in 4 years. A 10-acre grapefruit grove means an income for life—old age insurance. For particulars, address

Lake County Land Owners' Association
Fruitland Park, Florida Dept. D3
Owners, not agents. R. R. fare refunded to buyers.

Jacobson Gasoline—Kerosene Engines

Send for Free Booklet

One of our types of engines is bound to be just what *you* need, Mr. Farmer. One of our newest operates on either gasoline *or* kerosene. You realize what an advantage that is, for kerosene's most always on hand. No matter what job you want to do, the Jacobson engine simply walks away with the work. Jacobson Portable Gasoline Engines are approved and labeled by the Underwriters. Material and workmanship faultless.

Jacobson Machine Mfg. Co.
Dept. C
Warren, Pa.

POWER SPRAYER
for Moderate Size Orchard

A 100 gallon business outfit. 200 pounds pressure with 6 to 8 nozzles. 2 H. four cycle air or water cooled engine, double acting pump, sediment chamber. Hemp packing, ball valves, easy to get at. One of 70

FARMS FOR SALE.

BURLINGTON COUNTY, N.J.
FARM OF 348 ACRES, SUITABLE FOR DAIRY, Fruit and Potatoes. Farm of 170 acres, one of 80 acres; another of 70 acres, and others. Desirable country residence near Crosswicks, N. J.; large, well-arranged house, suitable buildings, twenty acres of land. Prices and particulars on application. JOHN H. HUTCHINSON, 1002 Drexel Bldg., Philadelphia, Pa., or Bordentown, N. J.

74 ACRE FARM FOR SALE.
55 ACRES FARM LAND
Balance timberland. In good cultivation; 2-story frame house, 6 rooms; new barn, running water to h use and barn; 2 miles to church, school and town; cash markets. Must be sold account of help. For information write H. O. WILLARD, Rt. 2, Hegins, Pa.

Fertile Farms and unimproved lands in Delaware, diversified farming, live stock, delicious fruits and ideal homes. For information, address STATE BOARD OF AGRICULTURE, Dover, Delaware.

Horticulture

LESSONS FROM COMMERCIAL GRAPE GROWERS

If one can propagate a choice new grape successfully, or grow some of the semi-hardy grapes of good quality out of the natural grape belt, he will find it well worth his while. The Green Mountain or Winchell grape is probably the best of the very early varieties. There are few higher in quality. It is fairly hardy, and ripens so early it can be grown safely usually in the colder sections of the country. The price of vines still remains so high that they are almost prohibitory to the commercial vineyard men. Desiring a considerable number of vines for my vineyard, I decided to plant cuttings and grow vines for planting. In the spring I selected a rich plot of clay loam, and planted cuttings I had kept during the winter in dry soil in the cellar. These cuttings were given fairly good culture. When I dug up the next year those that lived, they were like sticks with a few short scraggly roots on them.

DOWN THE ROW IN A CHANTAUQUA CO., N. Y. VINEYARD. NOTICE THE LIGHT SOIL WITH GRAVEL MIXTURE.

I have since visited Fredonia in Chautauqua Co., N. Y., the world's greatest nursery center in the United States for grapes and small fruit vines. More than 10,000,000 grape vines are annually grown and sold in the vicinity of Fredonia. The larger part are sold wholesale to distributing nurserymen and dealers. If one buys grape vines anywhere in the U. S., he may get Chautauqua grown vines. I visited the large propagating nurseries there and tried to learn their method. I was shown one year old vines, in the storage cellars, that had only one summer's growth, and some of them were nearly two feet long and were a mass of fibrous roots.

Inquiry of the Fredonia nurseryman as to how he could grow better vines in one year than I could in three brought the reply, "Because of our soil." The soil is the original bottom of Lake Erie, and is a rich deposit of light sandy loam, somewhat gravelly. It is very porous and admits sunshine and moisture freely and because of the gravel it retains heat longer than clay soil. It is the congenial home of the grape. Our soil is our natural asset and explains how we are able to grow vines for the world with little fear of serious competition." Inquiry as to methods elicited further interesting information. He said. "The most of us nurserymen own bearing vineyards. We begin pruning as soon as the crop is harvested, and bury the propagating wood in soil out of doors. If we continue pruning thru freezing weather, we cover the ground deeply with straw so it will not freeze, and bury the wood we cut off under it. In the spring we take up the wood, cut into pieces with two or three eyes, and plant 6 inches apart in rows about 2 feet apart and keep clean with cultivator and hoes all summer." I had learned some lessons and will not plant any more dry cuttings in heavy clay soil.

The soil of Chautauqua county is not only one of the best soils in the world for propagating grape vines, but it is equally desirable as vineyard soil. I rode many miles thru almost unbroken vineyards. found the vines thriving and bearing great crops. Concord is most planted, with Niagara and Delaware next. Here I learned my lesson again. The next vines I plant will not be on rich clay loam which is my best garden soil, of the low flat lands on my place, but I will select the higher elevation, with longest exposure to the sun, perhaps the gravelly knoll. The soil will hold heat longer and is so loose and porous, the grape roots will go deeper, wider and make a mass of fibrous feeding roots. Thru elevation and better air drainage the vines will escape more of the frosts of a colder country.

Before visiting the commercial grape section of New York I had tried to grow the Niagara grape in Delaware county where semi-hardy varieties are a doubtful proposition, and I found that some winters the vines winter-killed. In Onondago Co. I saw the Niagara grown very profitably in a commercial way, where the seasons are but little more favorable than in Delaware Co. Here I learned about the one and two year renewal system by which the best semi-hardy varieties are grown. I saw a vineyard of 50 acres where this system is very successfully practiced. In brief, the vines are laid down every fall, which is sufficient protection with little or no convering. Two or more vines are allowed to grow up from the roots, according to their size and strength. The main vine and laterals are shortened perhaps one-third, after the foliage is off, and laid down and held in place in some way. The next spring it is taken up and the vine spread out and tied in a V shape to the three wire trellis. When the vines get too large to bend over and fasten down easily, they are cut off and renewed from the roots by growing new canes as I have described. I went home and tried the plan. I am now able to get my Niagara grapes safely thru the coldest winter.

While growing grapes in a commercial way may not be a good proposition for many who are outside of the natural grape sections, yet I have demonstrated that a great abundance of good varieties can be grown for family use. Only in one year out of ten have I failed to ripen the Worden Niagara, Delaware and Moore's Diamond, and I do not see why I should lose my earliest kinds, which are Moore's Early and Winchel, any year. From the commercial growers in my state I have learned how to propagate vines, where to plant them, how to prune them, and how to protect them in winter. With this knowledge I do not see why any who has a piece of land need be without a full supply of fruit.—W. H. Jenkins, Delaware Co., N. Y.

CARE OF ASPARAGUS BEDS

Asparagus is one of the few crops that will grow without cultivation and without fertilization. It is probably due to this fact that such a diversity of opinion exists as to best methods of handling the crop to get the most profit from it. For instance, many growers claim that the tops should not be removed in the fall, but should be allowed to stand so as to keep the soil from blowing. Other growers claim that this is a bad practice; that the tops should be cut and burned just as soon as they die in the fall, so as to destroy the spores of the rust which is doing considerable damage to asparagus plantations. The question as to just how to fertilize the asparagus beds, what to apply, and when to apply it is equally perplexing. I give herewith an account of our method of caring for our asparagus beds together with the reasons for our methods, hoping that it may help to solve some of these puzzling questions for others.

In the first place we have a considerable acreage of poor light sandy soil. We have found that asparagus is one of the few crops that we can grow on this soil. Nearly every year we plant a few acres of this sandy soil to asparagus. We do not fertilize heavily at the start but keep applying a limited amount of manure year after year. Then as the asparagus grows and begins to return a profit we increase the amount of manure applied.

In the fall as soon as the asparagus tops are dead we mow them off close to the ground. By cutting them off early, we prevent the seeds from being scattered so widely as would be the case if we left them standing until early winter, or all winter as do some growers. Asparagus seed in an established bed are just as much a nuisance as weed-seed; the young plants have to be destroyed as soon as they come up. As soon as the tops have dried they are raked into heaps and burned. This destroys many seeds, and what is of more importance, the spores of the rust.

Growers who allow the tops to remain standing over winter claim that the destruction of the spores of the rust is no advantage of the fall removal and burning of the tops; for say they, "It has been shown by scientists that the winter spores of the rust do not live until the end of the cutting season; so what is the use of burning the tops to destroy them, when the tops might serve to hold the snow, keep the soil from blowing and furnish humus-making material when incorporated with the soil the following spring." It is true they have a good argument, but we cannot use the method, because, as stated above, we are starting a new bed nearly every year. Did we not destroy the rust infected tops as completely as possible, the spores would be present early in the spring in sufficient numbers to attack and weaken the newly set plants before they had gained sufficient hold of the ground to withstand them. Prof. J. B. Norton in his work of breeding asparagus for rust resistance at the Concord, Mass., Experiment Station found that the winter spores of rust are carried long distances by the wind in early spring; so that it is also no more than just to our neighbors, who are undertaking to start new fields, that we should do all in our power to prevent our fields from infecting their newly established beds. Where there are no new beds of asparagus being started in the community or when rust resistant varieties become introduced, the method of leaving the tops as winter protection will of course be the best practice.

"But" some one may ask, "how do you keep your light sandy soil from blowing when you cut and burn the tops during early fall?" We accomplish that with our system of fertilization. Soon after the tops are out of the way we broadcast from 6 to 10 tons of long, town horse manure over the beds. This almost entirely prevents blowing, and since the manure is rather coarse, there is very little loss from the fertility becoming quickly available, and leaching out, before the following summer when the asparagus is ready to make use of it. The quickly available commercial fertilizers, poultry manure, or well rotted barnyard or town manure, should not be applied until during, or at the close of the cutting season—from the middle of June to the first of July.

Asparagus is by no means an exhaustive crop. According to analyses made by Wolff, a large crop of three tons of asparagus spears, removes but 19.2 pounds of nitrogen, 5.4 pounds of phosphoric acid, and 7.2 pounds of potash. It would take but two tons of average barnyard manure to supply this amount of nitrogen, and one ton would more than supply the 5.4 pounds of phosphoric acid and 7.2 pounds of potash required. But in fertilizing it is well to keep in mind the fact that the more fertility the soil contains, within a reasonable limit, the larger will be the sprouts or spears.

With our sandy soil the problem of getting large paying crops of first grade asparagus is as much a problem of holding the soil moisture as it is of supplying plant food. By supplying nearly all of the fertility to the soils in the form of manure we increase its water-holding capacity as well as furnish the necessary plant food.

About sixteen years ago we planted our first bed of asparagus. I judge we applied on an average about 8 tons of horse manure yearly. We used no commercial fertilizer and but a few light applications of poultry manure during this period. At the end of the cutting season, about the last of June 1911, we plowed it up and planted corn. We harvested a large crop of fodder corn the following fall. Last year we applied from 600 to 800 lbs. of a 2-8-10 brand of fertilizer to the acre and planted sweet potatoes. From a measured acre of that field we harvested 615⅜ bushel baskets of marketable sweet potatoes. That was the largest yield of any sweet-potato grower exhibiting at the New York Land Show last fall. This year we have harvested a large crop of peppers from the same field. The ground is now as productive as a rich loam and it was gradually transformed from the light unproductive soil to its present condition by the yearly application of 8 tons of stable maure, all of which was paid for many times over by the amount of asparagus sold. In fact, that field of asparagus, during the twelve years in which it was cut, averaged as much clear money per acre as any crop we have grown, with the possible exception of strawberries and tomatoes, both of which demanded more fertile ground.

To summarize: Where new fields of asparagus are being started, the tops should be mowed and burned as soon as they die in the fall. This destroys a large portion of the seed as well as the spores of the rust. This is not necessary where no new beds are being started in the community, for the spores die before the end of the cutting season. Sandy soils are kept from blowing by application of coarse stable manure. Quickly available fertilizers should be applied at the close of the cutting season—not in the winter when the roots are dormant. A yearly application of 8 tons of manure has greatly increased the productivity of sandy soil, while a paying crop of asparagus was being removed.—Harris T. Kille, Gloucester Co., N. J.

Variety Tests of Wheat.—An interesting Bulletin under this caption comes from the Pennsylvania Experiment tSation at State College, being No. 125 of that station. The tests cover varieties from many sections, five varieties having been under test ever since the work was started twenty-two years ago. The tests apply more particularly to Hagerstown loam soil, but some interesting compariso s have been drawn.

FRUIT TREES at Half-Price
We sell best quality fruit trees, shrubs and plants at one-half the nursery agent's price—and pay the freight. All stock is northern grown, hardy and healthy. All orders guaranteed.

The Profits in Progress
Farmers are learning the profitable fertilizer—the one that gives the best profit consistent with maintaining soil productiveness.
Progressive farmers are increasing, for all crops, the
POTASH
in their goods. Results have shown there should be at least as much Potash as Phosphoric Acid, for ordinary farm crops take from the soil from 2 to 4 times as much Potash as Phosphoric Acid. For potatoes, truck and fruit the Potash should be double the Phosphoric Acid.
If your dealer insists on carrying only low grade, 2% Potash goods, we will sell you Potash in any amount from one 200-pound bag up.

Cow Testing Associations.

By H. W. GILBERTSON, Agriculturist, Sussex Co., N. J.

A Cow Testing Association is an organization of dairymen for the purpose of securing, at the least expense, accurate records of the production and cost of production of each cow in the herds of the members. The first Cow Testing Association was organized in Denmark in 1895. It proved so beneficial in that country that the number had increased to 530 in 1909. The movement has spread to other countries, and Sweden now has more than 700 associations, while Germany has more than 267, all organized since 1907. In Denmark the average number of pounds of butterfat per cow has been more than doubled since 1884, being increased from 112 to 235 lbs., while in 1900 the yearly average for the United States was only 145 lbs. The first American Association was not organized until 1905, but there are now more than 120 and new ones are being organized nearly every month. The first organization of this kind in New York State was in Delaware county, where two associations were formed in 1910. There are now 11 in that State while New Jersey has none.

Methods of the Association.—A dairyman or "Cow Tester," employed by the association, spends one day each month on each farm in the organization. He weighs the milk of each cow and tests it for butterfat, weighs and calculates the cost of her feed and determines the profit or loss on each cow for the twenty-four hour period. This is used as a basis for figuring the month's record. At the Minnesota Experiment station, where the milk from a herd of about 40 cows has been weighed every day for nearly twenty years, it is found that by taking the records for one day each month as a basis for the yearly summary the Cow Testing Association method gives an average error of only about 2 percent. The man who weighs the milk of each cow one day each month can therefore usually determine within two percent. of what each cow in the herd is producing per year. This is accurate enough for all practical purposes.

CHAMPION HOLSTEIN BULL AT LANCASTER CO. FAIR, 1913.
Owned by H, C. Reinhold.

Cost of Feed.—With the help of the dairyman the tester should determine the cost of feed for each cow during the preceding month and the amount of grain feed which should be fed to each cow per day during the coming month. The amount of feed required should be calculated from her milk production, condition and feed during the preceding month. The tester, from his training and experience as well as from his observation of methods of feeding in the other twenty-five herds in the association, should be able to assist the owner in finding the most economical grain ration to use with the available roughage in order to get the largest net profit per cow.

The tester starts his work at each dairy in the afternoon by weighing and recording the amount of milk produced by each animal. The same kind of records are taken the next morning. The calculations are made and recorded during the day in time to reach the next dairyman for the afternoon work. The results are placed in the farmer's herd book, which is kept on the farm and the association record book kept by the tester. At the end of the year the tester completes all records, leaving the farmer an accurate record of each cow in the herd.

Results of Cow Testing Associations.—Cows are found in some herds which do not even pay for the cost of the feed they consume. Many dairymen discover that the cow they considered the poorest stands among the best in the herd. In a California Association one man bought a cow for $42 that the owner considered "worthless" and this cow proved under test to be very valuable, giving 97 lb. of butterfat in 58 days. Some dairymen in five years have doubled the production of their herds with the same number of cows. This is an extreme case, however, and those who join the association must not expect such an increase. It is fair to expect that the average profit per cow should be increased from $5 to $10 at a cost of $1 per cow, if the boarder cows are replaced by better cows and feeding methods are improved.

In a Michigan Association the average number of pounds of milk per cow was increased from 5802 to 6426 in four years, the average percent. of butterfat per cow was increased 0.31 percent. and by better management the profits were doubled. The cows from one New York Association exhibited at the New York State fair last year were so nearly alike in conformation and type that only about one-half of the experienced dairymen visiting the fair could pick out the poorer cow. The better cow showed in the year's test $72.12 more profit for the year than the other.

A dairy was found in one association that made a profit during one year of $800 from 35 cows. The best 23 cows in this herd would have made within $32 as much profit as the entire herd. This knowledge enabled the dairyman to eliminate his poor cows and replace them with more profitable ones. In one year the average production in another association was increased more than 500 pounds per cow. In a Nebraska Association ten of the best cows yielded a net profit of $1,032, while ten of the poorest cows gave a total profit of only $57. The returns in a Cow Testing Association in Sweden were $18,153 greater from 639 cows the tenth year than the same number would have returned the first year, while the profits were nine times as great the tenth year. The cost of this added increase was only about $639. In many herds by more economical feeding the average cost of feed per cow has been reduced almost one-half. The monthly meetings held by the members are of an informal nature and very beneficial.

The cost of running a Cow Testing Association one year will be between $525 and $600, depending upon the wages it will be necessary to pay an experienced dairyman to do the weighing and testing and keep all of the records. It should be possible to hire a man qualified for this work for about $40 per month and board. The man should furnish his own horse. Twenty-six herds will be secured and considering the average size of the herds this will bring about 575 or 600 cows into the association. The tester should be a first-class dairyman, who is an expert in using the Babcock test, qualified to give advice on feeds and feeding and to keep an accurate record of each cow. It would be possible for the dairymen to do their own weighing and keep their own records but the best argument against this is the fact that most dairymen seem too busy and do not do it even if they resolve to do so. The association way is the cheapest since a man who weighs, tests and keeps records every day can do it in at least one-third of the time that the average man can do it.

REGULATION OF MILK TRADE

Last spring the New Jersey state board of health announced on one occasion that the number of dairies that scored above the stipulated percentage was smaller than the number of those falling below. The report for November was better. Of 280 dairy inspections made by the state, notice was given in three instances prohibiting the production and sale of milk. These dairies had customers in Newton, Long Branch and Trenton. The number of dairies scoring above 60 percent was 223; below, 54. Of the latter, nine were notified to improve their methods in handling milk within a limited time. These supplied Long Branch, Paterson, Pompton and Trenton. Marked improvement is reported in the condition of certain dairies that supply Trenton and Atlantic City, a re-inspection of which has been begun. Only one previous tour had been made. It will be necessary to visit 1,200 farms to complete the work.

The fact that must impress every observer of health legislation is that every municipality of any consequence is becoming pretty exacting in saying who shall and who shall not sell milk within its limits, and that the results thereof spell profit to those dairymen who are wise enough to take heed. But there is another important phase of the situation: What reasonably pure milk, and its intelligent use, can do for babies is strongly illustrated in a report of the Babies' Welfare Association in New York, just made public. From January to November, only four in 1,000 of the 33,000 babies under two years of age enrolled in the 55 milk stations died; and many of these babies were sick with digestive troubles when enrolled. Yet among all the babies under two years of age in this city, the death rate during this time was 75 in 1,000. One thing strongly brought out in this report is the fact that wholesome milk is obtainable, even for the poor, if only intelligent means are used to bring this about.

This brings up the wonderful work of the New York City Milk Commission, whose wide field has been almost nation-wide, and the results of whose labors have had a beneficial effect upon dairymen, bottlers, venders of the lacteal fluid, and boards of health, everywhere. This Commission consists of 17 experts, selected from various parts of the country, and milk legislation in many places is founded on its decisions. The chairman is Dr. W. A. Evans, professor of preventative medicine in Northwestern University. Dr. John F. Anderson, director of the hygienic laboratory of the United States public health service, Washington, is vice-chairman. Chester H. Wells, health officer of Montclair, represents New Jersey. Among the recommendations made by this commission as a means of protecting public health are pasteurization of milk, grading and labeling all milk with its grade, date of production and date of delivery to the consumer.

It is but a step from the question of state milk inspection to that in which the national government enters. With the exception of a certain quality of first grade milk, which has been protected against infection in some other way, pasteurization is sanctioned by the commission, which lays down rigid rules for the tuberculin testing of cows, inspection of employes and sanitary condition of dairies to determine what milk may be excepted. And it is provided that the milk must not contain more than 100,000 bacteria to the cubic centimeter when it reaches the consumer. The commission, however, records itself as agreeing with the U. S. Department of Agriculture, in the contention that milk containing a few disease germs may be dangerous, while other milk may be high in bacterial count and still be only dirty, old, or have been held at too high temperature. Bacterial count, nevertheless, is held by the commission to be the most practicable means of determining whether milk is safe or dangerous to use. As a means of commercial pasteurization, it is recommended that milk be held at a temperature of 140 degrees, Fahrenheit, for 30 minutes; this preferably to be done in the final container.

The grades of milk recommended are four. Grade A, when sold raw, must come from cows free from disease, as determined by tuberculin tests and periodical physical examinations by qualified veterinarians, must be handled only by employes who are regularly examined by qualified physicians, and dairy and shipping conditions must be such that the milk shall not contain more than 100,000 bacteria to the cubic centimeter when delivered to the consumer. Grade A, pasteurized, shall come from cows free from disease and must at no time contain over 200,000 bacteria to the cubic centimeter. It must be pasteurized under official supervision and have a bacterial count of not more than 10,000 when it reaches the consumer. This is considered safe for infant consumption. Grade B milk must come from cows passed on at least once a year by qualified veterinarians, must never contain more than 1,000,000 bacteria, and must not show more than 50,000 when delivered to the consumer. This is advised for adult use only. Grade C milk, used for cooking and manufacturing purposes only, and careful restrictions by law of its sale are recommended, differs from grade B in having over 1,000,000 bacteria at the outset.

Announcement has been made of the prosecutions of 93 dealers in various parts of the country for violation of the Federal pure food law. The government recognizes this problem of pure milk as most important in affecting the public health, but restricts its inspections to that milk only which enters into inter-state shipment, and for this reason, it will always be necessary for state and municipal authorities to conduct individual examinations into local milk supply. The government's requirement is that there shall be 11¾ percent of solids in milk, of which 3¼ percent. must be fat, and 8½ percent. of non-fat solids. In other words, the percentage of water must not exceed 88¼ percent.

The government's requirements say nothing about the number of bacteria contained in a cubic centimeter of milk. This important matter is left for the judgment of the courts before which these precautions have been brought. In all cases, however, the prosecutions have been based on the excessive amount of dangerous bacteria found in the milk, and in those cases where fines were imposed, the milk was considered adulterated for the reason that it was "composed in part of filthy, decomposed and putrid animal substances."

The government milk experts believe in making sanitary the places which are the source of milk supply. Farmers are encouraged to keep the best stock that their money will buy, same to be tuberculin tested, if possible; to maintain clean stables, with modern equipment and sanitary utensils, cooling and storage facilities, and to adopt careful methods of handling milk from the time it leaves the cow until it reaches its final market.

The National Government, like the individual state and the separate municipalities, is hampered by insufficient funds. A recent investigation by Ernest Kelly, the expert in charge of the government's market milk investigations, revealed the fact that but 4.14 cents a year per capita is all that is spent for milk inspection in the United States. Mr. Kelly's investigation was fruitful in other ways. He found that the standards for bacteria ran all the way from 25,000 up to 1,000,000 per cubic centimeter. Thirty-three out of 66 reported 500,000. Fat standards ranged from 3 percent to 3¾ percent; 51 cities out of 122 requiring the smaller amount. Total solids showed an even greater variation, running from 10.62 percent up to 13 percent. Mr. Kelly states that pitifully small sums are appropriated by city councils and state legislatures to push this campaign of education. Last year 22 cities reported that they had spent absolutely nothing for such work. One city spent one-tenth of a cent per capita per year, while the highest reported was a little town in Georgia which spent 19 cents per capita per year. Only 43 of 162 cities spent 5 cents or more per capita.

The investigation disclosed that milk inspectors are poorly paid, the position being oftentimes given as a reward for political services. It seems to me that all milk inspectors should be appointed only as the result of a civil service examination. Mr. Kelly says bacterial count is not a complete safeguard. A sanitary inspection is absolutely necessary to ascertain possible sources of contamination; and the farmer needs instruction in improving conditions.

Harder Silos

For 15 years the One Best Silo. Big, sensational improvements this year, making the Harder Silo better than ever. Of massive strength, anchored fast, solid as an oak, perfect fitting doors, highest grade material and construction—perfect in every detail—that's the Harder Silo.

More durable, less expensive, than concrete and tile.

The kind "Uncle Sam" uses. Big free catalog describes the new spline-dowel, the new intermediate ladder rung, the anchor, and scores of other distinctive features. It tells why *you* need a Harder Silo. Write today.

Five Seconds and the Hinman Cups Are On

The HINMAN is at work—the milk is flowing swiftly and silently into the pail. Vacuum pressure put on teats gradually. Released 45 times a minute. The one-piece tapered teat cup with simple rubber mouth-piece imitates natural method of milking.

Hinman milked cows are the big money makers. The Hinman operator is rapid and thorough. The single tube from the pail makes handling easy. No wet unsanitary milking. One man with a Hinman outfit can do the work of three hand milkers. 60,000 cows milked daily with the

HINMAN Milker
The Machine Your Wife or Son can Handle

Because it's light, easily adjusted and easy to clean. The vacuum valve chamber is in the pail cover. It allows the operator to move machine easily and change pails rapidly as there is no vacuum in the pail. Each cow's milk kept separately.

Attaching HINMAN Cups

These are only a few of the exclusive HINMAN features. You'll find all the others in our free illustrated booklet, "How One Man Can Milk 25 Cows an Hour." It will mean that you will buy a Hinman. Agents everywhere.

Poultry

THE FEEDING PROBLEM

The feeding question offers a large field for study. A perfect ration has never yet been found.

Just to indicate how impossible it is to compound a perfect ration, let us look at this problem as it confronts us during October and November, assuming warm weather for October and cold for November. The carbohydrates of any foods are the fuel supplying or heat producing agents. They are to the body what wood and coal are to the stove. On a cold day it is necessary to put twice as much fuel in the stove as on a warm day. In like manner also it would seem that fowls must devour twice as much carbohydrate matter in cold weather. Theoretically this would be true but in reality it is not. Food contains protein matter besides carbohydrates and the consumption of twice as much food would involve twice as much protein as well as carbohydrate matter, which would entail a double burden on digestion; and digestion is able to do only a certain amount of work in converting carbohydrates into fuel and protein into flesh. We can not figure on carbohydrates in a ration without taking proteins into consideration also and it is in maintaining a proper balance between these two that the dificulty presents itself.

ANCONA BABIES READY FOR A BUG.

It is in the rapid changing weather that the problem presents itself most forcibly during the periods in the fall and spring, for instance, when one day is cold and another warm. How can chickens be made to lay steadily thru such variations of temperature?

According to Prof. Rice a hen or pullet with a surplus of fat is the best layer. If this be true, it goes to show that the carbohydrates constitute the limiting factor in the relation of feeding to weather variations. Instead of the fowls having to eat twice as much grain to meet the double amount of carbohydrates necessary in cold weather they can consume the same amount of food and draw from the surplus fat on their own bodies. On warm days this fat is stored up and on cold days requisition is made upon it.

The Leghorn hens are not as good layers in cold weather as those of some other varieties. The Leghorn is more active by nature and hence does not put on much fat. Being shy in feathers, the Leghorn uses up surplus energy in supplying its body with warmth. This is the explanation also for heavier breeds of hens becoming fat in warm weather.

It is to overcome some of the obstacles and difficulties already presented, that different methods of feeding are necessary. Leghorns are given more corn in rations than loose feathered breeds, because corn contains a large amount of carbohydrates. The heavier breeds, however, receive less. For them oats is substituted largely for corn in warm weather, because oats contains less carbohydrate matter.

The question is sometimes asked "Why do pullets not get as fat as hens?" Two reasons may be assigned for this: (1) hens are less active than pullets; (2) they lay fewer eggs, and thus there is not so great a drain in this direction, records showing that only in rare instances will a bird lay more in its second than its first year, and it is impossible to make an active fowl take on fat to any great degree while it is laying. It is true also that some fowls, probably of the better breeds inherit a susceptibility to fat making.

Last fall I had some early hatched pullets that seemed to be fat and heavy, so much so that I began to question their ability as good layers. I kept on feeding them, however, until they were 7½ or 8 months old. There were only five in this lot but three of them laid over 200 eggs. The entire five have been steady, excellent layers, due, no doubt, to the fact they carry an extra amount of fat for emergency. The lowest record out of the five is 169 eggs.

The claim has been made that the lean fowl becomes broody because of an inclination to take on fat. Our experience inclines as to the belief that the bird which has been on the nest for three weeks is leaner than when it began, and in lots of cases will lay in a few days after coming off the nest. A hen will not sit, no matter how lean she is, if she does not feel like it. One breeder claims that by selection he has secured a strain of White Wyandottes fifty percent. of which never show an inclination to sit. The Leghorns are supposed to be "non-sitters" but instances are known where hens of this breed have become persistent sitters. Feeding does not have anything to do with the sitting propensity of a hen.

We do not agree with the claim made by some, that hens are capable of selecting their own diet, but believe they will consume anything that is given them if it is palatable. Experiments carried on by the Missouri Experiment Station show that birds which were allowed to help themselves to about 32 different kinds of feed were in the lead during cold weather, but dropped very decidedly in hot weather.

To get good results in poultry feeding one must follow natural laws. Variety of diet is as necessary to fowls as to human beings in order to produce the best results. Corn, wheat and oats are their favorite grains. From these three grains and beef scrap, combinations may be made for mashes and grain mixtures.

The safest way to feed is to find some known and tried farmula and stick to it. A bird in the hand is worth two in the bush and if you get eggs in abundance on the food given, be satisfied and do not change.—C. VanHorn Jr., Delaware Co., Pa.

COST OF HORSE LABOR

Those past masters of horsemanship, the Arabs, have a saying that "rest and fat are the greatest enemies of a horse." The Germans have an old proverb to the effect that "the eye of the master fatteneth his cattle." Feeding is not an exact science, but will ever remain more or less of an art. No two horses, like no two persons, require the same feed or the same amount of feed. Individuality must ever be taken into consideration. Some horses are proverbially easy keepers while the long, rangy, slim-bellied kind are proverbially hard to keep. The ration must be made to fit the individual animal and for the ration to fit the individual animal, the feeder must ever be on the ground and use common sense, must watch his animal, know how he responds to different feeding and varied care. An old Englishman once told me that our American animals do not see enough of their masters to even recognize their breaths. In this saying, there is a great deal of truth for few of us are about and around our animals enough to know them as we should. Good, clean, comfortable, well-ventilated quarters will go a long way in keeping our horses in good condition. Good grooming must be taken into consideration. People have said that grooming reduces the cost of keeping horses as much as one-fifth to one-fourth, and when you see the rough unkept coats of many animals you believe that there is more or less truth in this respect as the animal which is sleek, active, alert and willing is always the well kept horse.

CONCRETE HOG HOUSE ON OVERBROOK FARM, MONTGOMERY CO., PA.

Far too many of our horse owners are too liberal in their feeding giving both grain and hay, especially hay to an excess. Many feeders keep between 24 and 30 lb. of hay before their horses each day. This is an excessive amount of roughage. It produces a distension of the digestive organs causing them to press against the lungs with bad effects.

We can not feed horses in accordance with any set rule as to just how much or how little to feed. Most of us would do well to give less than at present. All of us can cut down feed bills by watching the markets more closely, substituting cheaper for more expensive feeds in accordance with market fluctuations. Nearly all would do well to pay more attention to the protein content of various feeds especially when feeding brood mares and growing colts. Feeding straw or fodder to idle horses in winter means an enormous saving while cutting down the ration of idle horses at least one-third means a proportionate reduction in bills with horses in better shape to withstand the season's work. Good clean, comfortable quarters coupled with good sensible care can not be left out of consideration.

All these factors, combined with a better distribution of horse work, the maintenance of no needless horses, the keeping of mares and the growing of colts will enable us to obtain each hour of labor from our animals at a far less cost than formerly. This will cut down the largest single item in the operating cost of our farms to a material extent and in the end will mean that we can raise a bushel of oats or a ton of hay for less than before.—C. W., Crawford Co., Pa.

SKIM-MILK FOR YOUNG PIGS.

As indicating the value of skim-milk for pigs my experience with 13 pigs bought from a neighbor may be interesting. On May 19, I sold my hogs that weighed 226 lb. each and bought 13 pigs weighing 108 lb. each. I am reminded of the old question of when a pig becomes a hog, as the "pigs" bought were the same age as the "hogs" sold. The "pigs" had been wintered on corn, corn, nothing but corn, while the "hogs" had been fed a liberal amount of skim-milk in connection with a moderate amount of corn. The balanced ration made more than double the amount of pork that was made by the one-sided ration and at a less cost. In fact my neighbor admitted that he would have made money by giving his pigs away at weaning time. He was "short" on cows and "long" on corn; but the corn fed was worth more than the pigs at 7 months of age.

When the 13 pigs came to my place their corn ration was reduced about a half. They got an abundance of milk and a fair amount of grass; they were never allowed out of an orchard of about an acre. The first eleven days these pigs gained 40 lb. for each bushel of shelled corn fed. Their long-continued corn diet had made them glad for a change of fare and it seemed that there was a place for all the protein that they could devour. It was not expected that a 40-lb. per bushel gain could be kept up until selling time.

At 8¼ cents the 13 pigs cost $115.50 on May 19. I sold 9 July 28 weighing 1,670 lb. at 9¼c., making $154.22, and the remaining 4 on Sept. 15, weighing 1,040 lb. at 8½c., making $88.15. Total receipts were $242.37. They ate 50 bushels of corn that was bought in May at 64c. There was a profit, due in part to advancing prices, of about $95. The most interesting part of the experiment is in reference to the gains. No one can expect to be certain about prices; so that buying both hogs and corn to feed them may or may not be profitable. But the feeding problem is one in which the element of chance plays but a little part. These pigs gained 1,310 lb. on 50 bushels of corn in connection with skim-milk, for which there is no market excepting when fed to live stock. I have had higher gains beginning at weaning time.

Recently a neighboring farmer told me that he had failed to get much good from milk as a pig feed. He had put two equal lots of pigs in clover pasture, one lot getting milk, the other none. He could see no difference in the two lots of pigs after the experiment had been carried on for several weeks. The explanation of the failure of the skim-milk to show results is that the clover pasture furnished all the protein that the pigs needed. The overplus of protein furnished by the milk was thrown away. Milk and corn make a royal combination. Where milk can not be used middlings will do very well, but it costs too much for its nutritive worth. Digester tankage, altho costing more per ton than middlings, is the cheaper feed, as has been repeatedly stated by the experiment stations and private investigators.—H. J., Chester Co., Pa.

ROAD DRAG PATROL

Those who are following the series of articles on Better Roads Where You Live will have noticed that it gives what the name implies; methods of improving the local roads at lowest cost and with the least loss of time in organization work. Two things of greatest importance to farmers in this plan are that it provides for improvement of the business roads, those used by farmers in the every-day business of farming; and that it places responsibility for road improvement upon the most interested parties. The road question is of greater importance today than it has ever been before. The defeat of the bond issue in this state at the last election was not a check on road improvement work in this state. It was merely the termination of a road policy which was taking the actual work of road improvement farther and farther away from its natural field and returning less and less for the money invested. The farmers' road problem is right at home in their individual communities, and the greatest need in road legislation is a set of laws which will place the responsibility on the communities and encourage road building by the home people.

We are receiving communications from every part of the state indicating the interest which is felt in this subject. When the farmers go about this matter seriously, and determine upon a policy which will care for their local roads they will get results. Watch our Road Department and do your share toward working up community interest for real constructive work.

FARMERS' WEEK AT STATE COLLEGE

Farmers' Week at State College, Pennsylvania, was established in 1905. Primarily it is an effort to place the facilities of the college at the service of all the farmers of the state so that they may have actual school advantages for a week. To do this, the holiday vacation, when the regular students are absent, has been adopted as the time when the end in view can be most adequately accomplished.

Some idea of the growth of this movement and of the interest of those whom it is intended to reach may be arrived at, when it is known that at the inaugural session of the movement in 1909 185 farmers were present from 36 counties in Pennsylvania, as against 980 at the session just closed from 62 counties. The attendance this year shows a remarkable increase over that of last year of 678 from 59 counties.

It would be difficult to imagine a more comprehensive or instructive program than that followed out. Every phase of farming from soil analysis and fertilizers as the fundamentals, to marketing problems and co-operative methods, had a place and were given the attention and treatment commensurate with their importance. Theory and practice were correlated in such a manner as to give a proper balance to the work. Whenever possible and practicable, lectures were supplemented by demonstrations and in such features as apple packing, killing and dressing poultry, demonstration, care and operation of farm engines, the farmers were given opportunity for personal participation. Lantern slides illustrating popular phases of farm practice, added to the value of many of the lectures.

While members of the faculty of the Pennsylvania State College were responsible for the greater part of the program a number of practical men as well as representatives from various outside experiment stations contributed. Addresses were followed in many cases by practical discussions and questions, in order to allow an opportunity for the clearing up of hazy points.

Discussions were not confined to actual farm operations and methods exclusively. The business side of farming was given consideration and some of the general problems of rural life, religious, educational and social formed the basis for some interesting and instructive addresses. Dr. Arthur Holmes, Dean of the schools at State College, in discussing some of the problems confronting rural committees, made a plea that rural dwellers endeavor to create a "country consciousness" and that they quite endeavoring to imitate the artificial life of the cities. Along the line of educational work Dr. Holmes recommended the employment of country-bred teachers for the rural schools, instead of the importation of instructors from the cities who have no country training and lack "country-mindedness." He recommended the same qualities for the minister of the country church pleading for the country-bred, broad-minded individual and if possible the man whose desire is to confine his work to the country district.

Several features in connection with Farmers' Week are worthy of mention. The Extension Department of the Agricultural School at State College, has given much time and effort in fostering the Boys' Corn Club movement. Closely co-operating with the college in this movement the different County Agricultural Experts have been a large factor in its success. This year clubs from many different counties were present. Prizes, including a term of instruction at State College, expenses for Farmers' Week and books on Agricultural subjects were awarded. Lancaster, Mercer, Franklin and other counties were represented in the corn contest. In connection with this contest and the visit of the contestants at the college, several of them have signified their intention of returning for courses at the agricultural school.

Four boys from Lancaster County, viz: Paul B. Flory of Pequea Creek; Noah Hershey, of Leaman Place; C. C. Brinton, of Christiana; and A. C. Bruckhart, of Lititz, upheld the reputation of their section for banner productiveness by taking first, second, third and fourth prizes. To 11 year old Aleen Fell, of Transfer, Mercer County, the youngest participant in the contest, a special award of second prize for the best 10 ears of corn produced anywhere in the State, was made. Miss Fell, has been christened the "Queen of Pennsylvania Corn Growers" as the result of defeating 80 boys in her home county of Mercer, in the sweepstakes' corn growing contest conducted by County Agent McBride. Her accomplishment of almost 98 bushels of shelled corn from a single acre, during a season of dry weather and early frost is most noteworthy. Those in attendance at Farmers' Week were honored by Miss Fell's story of how she had accomplished her feat.

Domestic science as applied to the farm home and the proper equipment of the home to insure ease of housekeeping operations received special attention from authorities on these subjects.

Significant of the interest which is being aroused in agricultural lines was the degree of intelligence represented by the class of those in attendance. Farmers and practical men in all lines of agricultural work, school principals, and county superintendents mingled with each other, arguing well for coalition of the interests represented by each class and a sympathetic communities.
the educator, and those interested in social and economic conditions in rural understanding between the farmer and

Of special significance, also, was the large number of those of the younger generation who were present, and the increase over previous years in the number of women, indicating how infectious is the desire for the acquisition of knowledge along just such lines as are covered in the Farmers' Week program.

The lack of equipment and the crowded conditions under which the agricultural school of the college is laboring was never more strongly emphasized than during the sessions incident to Farmers' Week. Most of the sessions were held in crowded rooms, of necessity, and in some cases even standing room was at a premium.

Following Farmers' Week there is being held at State College a conference of high school principals and educators, for the purpose of pursuing short courses in agricultural work. The County Agricultural Experts are also holding a two weeks' conference devoted to lines of study on which they are desirous of having special instruction.

That Farmers' Week this year was preeminently successful, goes without saying. To Dean R. L. Watts and Prof. M. S. McDowell of the Extension Department belongs much of the credit for the planning and carrying to completion of the program.

STATE CAPITAL NEWS

Traction License Questions.—Enforcement of the new automobile license law, which regulates traction engines for the first time, is proving to be more or less of a problem. It is probable that the next legislature will be asked to make some changes. The provision that cleats must be not over an inch and a half has cause a flood of protests, but the officials take the position that as long as it is the law it must be enforced. People responsible for the law say that if larger cleats are used it will make trouble for roads. Another objection is that the traction engines are paying double tax, being taxable as personal property and also being subject to a state license.

Automobile Rush.—The rush for automobile licenses is keeping officials on the jump. About 28,000 have been issued. It is noticeable, say the people at the department, that the issuance to people living in rural districts is greater than in the early rush of last year. In 1912 and 1913 the early demands came almost axclusively from the cities and towns, but this year a good many farmers are having their machines entered early. It is estimated that 10 percent more cars are being registered from the country than last year. Unfortunately there is no way of accurately stating how the cars are divided until the lists are made public.

Soil Study Encouraged.—A new feature of work at the farmers' institutes and moveable schools is encouragement of the study of the soils. Lecturers are giving this much attention and are pointing numerous instances where farm owners have benefited from scientific examinations of their soils.

Schools Well Attended.—Director A. L. Martin, of the farmers' institutes says that the attendance at the farmers' moveable schools, which have been held thus far in the western end of the state, has been greater than expected and that the sentiment is much in favor of an extension of that form of educational work among the farmers. It is thought that owing to the popular interest a greater appropriation will be made available in 1915. The lectures at these schools supplement what is taught at the institutes and lead to practical demonstration wark.

Uncertain About Highways.—State officials appear to be more or less uncertain about the highway work for the coming season. In three months the time for repair of the roads will be at hand and as many have been allowed to run down because of lack of funds the chances are that there will be many highways which will be in need of improvement. Officials of the State Highway department say very plainly that unless the money from the licenses of automobiles can be made available there will be a curtailment of work and that much accomplished last year will be lost. It is unfortunate that so much time has been lost in the settlement of this question as it will be well into spring before the courts determine whether the income from licenses can be used for road work or not. Incidentally, it ought to furnish the legislature with an incentive to make laws so that there can be no doubt of their meaning or else oase appropriations on revenue about whose disposal there can be no controversy.

The Oleo License Rush.—All records for the issuance of oleomargerine licenses have been broken and it is expected that before the end of the month fully 1,500 licenses will be issued. The increase in the demand is attributed to the desire of merchants to handle the oleo trade for which there is more market now than for butter. In 1913 the state issued about 1,900 licenses and received more money from that source than ever known before. The prosecution of persons who sell without a license is being carried on vigorously and probably 50 such suits are now pending in the courts. Between oleo and cold storage the dairy and food division appears to have its hands full this winter.

Liability Law Soon.—People at the Capitol are voicing the belief that the next legislature will enact an employers' liability bill on a state insurance basis, much as was proposed by those who stood out against the drastic law proposed by the state commission. It is understood that the commission, which was reappointed, stands by its former bill, but this is recognized by almost everyone else as impossible of passage because of the right and left way in which it would hit. There is not so much opposition to a liability law thruout the state as there is to one which would work a disadvantage to the farmer and the small manufacturer. It is all right to have such laws for large employers of labor, but to put them on a plane with the tiller of 120 acres or the employer of four men appears to everyone but members of the commission to be more or less unfair.

School Legislation.—As a result of the recent meeting of the State's teachers at Pittsburgh, steps will be taken to draft bills for the next legislature which will afford means of working out pensions for teachers and of bringing to legislative attention the urgent necessity of providing money for small districts to enable them to give the educational advantages which the law demands. The teachers' pension plan will probably be one which will enable the state to make an appropriation, leaving the administration to the local district or county, which must also give a share. As to the equalization plan, all that needs is public sentiment.

Educational Salaries.—Dr. Nathan C. Schaeffer, state superintendent of public instruction, devotes considerable attention to the smallness of the salaries of the public school teachers. Thruout the state the average increase in the salaries of male teachers per month was 78 cents and of women 28 cents. When one considers what teaching means, it seems rather singular that the state so lavish with its charitable appropriations and liberal with means for public works should be unable to add more to the monthly stipend to the educators. Dr. Schaeffer points out that the increases are entirely too slow in coming. It is probable that next legislative session there will be an effort made to advance the state school appropriation from $15,000,000 to $20,000,000 for two years, tho additional $5,000, 000 to be for the teachers' salaries.—Hamilton, Harrisburg, Pa. Jan. 5th, 1914.

NEW JERSEY FARM NEWS

The Scully Waterway Bill.—Congressman Thomas J. Scully, of this state, has introduced a bill in the House of Representatives, making provisions for the construction of a canal across the state to connect the Delaware River with New York Harbor. The link is to be completed within eight years, and will form a part of the Atlantic Coast Inland Waterway. Leading farmers and farmers' organizations in this state have been advocating such a canal for several years.

Crops Show Normal Increase.—The cereal crop in New Jersey comprising the corn, oats, rye and winter wheat yield, totaled 15,560,000 bushels this year, as compared with 14,945,000 bushels harvested last year was worth $10,297,000. Ground planted in cereals this year totaled 260,000 acres, or 4,000 more than were used in 1912 for that crop. Concerning the winter wheat now planted in New Jersey, there are 83,000 acres, of which 95 percent were found to be in perfect condition at the December inspection. Winter rye was planted in 79,000 acres this fall, and the examination showed the condition of the crop to be 96 percent perfect. In 1912, 1,000 less acres were sown in rye, while the acreage planted in winter wheat was the same this year as last.

The Oyster Industry.—In this state there are 40,000 acres of ground in use for oyster planting, with nearly 10,000 men engaged in the industry, the output being worth $4,000,000 a year. Chief Charles R. Bacon, of the State Bureau of Shell Fisheries, renews his recommendation of last year for a merger of the oyster commissions into a single body, but to remain separate from the Fish and Game Commission.

Forests Should Be More Profitable.—The State Forestry Commission estimates that the 2,000,000 acres of forest land in New Jersey might be made to yield an annual net income of $6 per acre, instead of about 50 cents as at present. The commission shows that the German State of Wurtemburg has practically the same area, the same population, similar territory and similar interests as this state. Wurttemberg's forests yield approximately 12 times as much revenue as those of New Jersey. Other points made in this report are: Of 678 fires, 45 percent were traced to their authors and fixed as violations of the law, thus showing that violators can be reached and punished; railroads are the worst offenders in the setting of fires; purchase of forests by state will be limited, so that private owners must be depended on for most of the work in forestry; the beginnings of forestry are practiced on some 200,000 acres, one-tenth of the whole forest acreage of the state; great attention is being paid to shade trees in 52 communities.

State Libraries in the Country.—During the past year, library extension work was pressed with vigor. Eight libraries have been organized, four re-organized and one partially so. Eight granges have started reference collections in their halls, and seven new reading circles have been started in rural communities making a total of 69 such circles started under the supervision of the State Library Commission. The traveling library service has been extended to 41 new centres, making the total number of stations now served 323.

No Lecture Train.—The State Board of Agriculture and the Pennsylvania Railroad have decided not to run a lecture and exhibition train to remote rural sections of the state this year. As no train was run last year, it is probable this method of disseminating the latest ideas in agriculture will be abandoned. A better scheme of increasing freights from the farm, the farmers say, would be to reduce the rates on fertilizers and seeds. An agitation has been started for a reduction of the freight charges for lime.

School Laws Hit Again.—The new school laws seem to be in for a continual lacing. Now there are complaints that the whole educational system is based upon the needs and conditions of the large cities, and that attempts are being made to adjust the rural school to these needs. For some time there has been a cry that the system of proportioning the taxes derived by the State from the railroads—and this income has been enormously increased under the new regulations,—is not of mutual advantage to all of the schools, the rural school losing out in the ratio of allotment of the money. While the methods of taxation and of distributing school money, will in all probabilities remain unchanged, the demand for a normal school where teachers for rural schools may be trained, is a good one, and should be enacted into law.

New Use For Schoolhouse.—The farmers' institute which was held at Red Bank, was held in the auditorium of the high school building, and this was the first instance in the eastern part of the state where the schools have been used for such a purpose. The use of the high school for this meeting was in accordance with the provisions of the law past last year providing for wider use of the schools. The law gives to boards of education the power to permit the schools to be used for meetings of all kinds and for every public and semi-public purpose.

Protecting The Skunk.—A law passed last winter affords partial protection to the skunk. There is now a demand on the part of farmers, the action of a few recent meetings to the contrary, to afford the skunk full protection. Authorities say the animal is the inveterate foe of the white grub, the Kansas grasshopper, the cut-worm and the range caterpillar, and that the recent increase of these pests is due to the fact that the skunk has been almost exterminated.—D. T. Hendrickson.

NEW YORK LETTER

Farm Bureaus.—There are now 18 farm bureaus in this state in actual operation and more are organizing. The Boards of Supervisors in several counties will be asked to bear their share of the expense for such bureaus this winter. The following counties have bureaus which are in charge of the agents here named; Allegany, F. C. Smith; Broome, E. R. Minns; Cattaragus, H. K. Crofoot; Chautauqua, H. B. Rogers; Chemung, G. P. Scoville; Clinton, C. B. Tillson; Cortland, E. H. Forristall; Dutchess, F. H. Lacy; Franklin, O. F. Ross; Herkimer, M. E. Chubbuck; Jefferson, F. E. Robertson; Monroe, L. A. Toan; Niagara, E. H. Anderson; Oneida, G. W. Bush; Ononadaga, S. A. Martin; Oswego, H. M. Doyle; St. Lawrence ,C. S. Phelps; Wyoming, W. L. Markham.

Commission Merchants.—A case came up in the course of the enforcing of the new commission merchants' law that will probably require an amendment to the law to be made this winter. A commission merchant in New York inherited his father's business which had been established for 80 years. The son knew little about the business and the management was given over to an employe who soon ran it into the ground. Insolvency followed. A farmer who had shipped produce to this man could get no returns, so he took the case to the Agricultural Department. But there were no assets. The case may test the criminal liability of merchants under the law, but it will almost surely cause an amendment to the statute to govern such cases in the future.

Seed Exchange.—A seed exchange is to be established at the state agricultural school at Canton during Farmers' Week, January 26 to 31. Those who have seed of any kind to sell can have samples of it there, accompanied by a letter stating price and quantity for sale. This is done to facilitate the movement urged by Dean Cook for growing and marketing of seed in northern New York.

Various Matters—The total receipts of the state fair last fall were $135,105.71, which gave a balance of $29,327.72.—The eastern section of the state Fruit Growers' Association will hold a convention at Poughkeepsie on February 19.—Geo. W. Parnell, of Wingate, Ind., was elected president of the American Cheviot Sheep Society at Hartwick, N. Y., last week.—A penalty of $20,000 was collected by the conservation commission from a poultry company in the central part of the state that breeds wild and mallard ducks for market. They bought some down in Virginia and sold them in New York as fowls raised on the New York farm, suit followed.—The Central Y. M. C. A. of Albany announces a series of lectures on farm topics. The speakers are Edw. Van Alstyne, of the Farm Institute department; Prof. C. S. Wilson, of Cornell; Geo. G. Atwood, of Albany; Prof. Rice, of Cornell; E. D. Van Buren and John Jeannin, Jr., and Miss L. Minns, of Albany.—D.

OVER 7,000 ANSWER "HERE"

Lancaster County Farmer's Institutes, recently closed, were a series of meeting held in eight places and attended by over 7,000 people, as counted at each session. Close studious attention was the rule and not the exception. Tobacco culture, steer feeding and corn growing were live subjects for dsicussion, and many lingered for the last word on these fruitful sources of income. Steer feeding is assuming its former proportions in farm economies, as this winter there are being fed 27,000 head in Lancaster County for spring sale.

There were eager listeners at the institutes to hear the latest on truck growing, orcharding and farm poultry. A few interesting talks were given by local men. Dr. Pickle, of Millersville, discussed organized effort in selling the tobacco crop, and insists that the tobacco grower should say to the purchaser: "We are ready to sell, our price is ——, instead of meekly asking What will you give us."

Farm exhibits were many and very creditable at Maytown, Lampeter, Lititz, Paradise and Ephrata. At Maytown a poultry show of much interest was an annex. Artistic skill of farmers' wives and daughters was manifest in a display of useful and ornamental articles from quilts down to doilies, laces, jabots, etc. The greatest need now to make these institutes more popular is larger halls to accommodate the people.—D. H. Watts.

FARMERS' WEEK AT RUTGERS

Farmers' Week at the New Jersey State College was attended by about 800 farmers. The addresses covered almost every conceivable phase of agriculture, and among the experts who addressed the farmers were Dr. Carl W. Gay, of the University of Pennsylvania an authority on horses; J. H. Hale, the Peach King, of Connecticut and Georgia; Dr. Cyril G. Hopkins, the soil expert from Illinois; Edward Van Alstyne, Prof. J. C. Graham, of Amherst, and the members of the faculty of the College. Special subjects which received consideration were co-operation, transportation and marketing. State Entomologist Headlee sounded a warning against a threatened invasion of the pine beetle from European countries. This pine beetle is a recent importation, but it has been found in one large nursery in New Jersey. He says it is likely that the establishment of the beetle can be delayed, if not absolutely prevented in this country. Director Lipman, of the Experiment Station, said that the greatest interest of the farmers today is how to use lime. The older the soil is the more sour it becomes, and it is necessary to treat it with some form of lime to kill the acids.

How to Get Better Roads.

Earth Roads Improved by Use of King Drag.

By Dr. DONALD McCASKEY.

Starting The Road Drag Patrol

Uncle Joe Cannon was perfectly right when he said: "The only way to get good roads is to have everybody in the towns and country educated to what the cost of good roads means. The only way to do this is to have school-house government in the town, the country and big cities—everybody shinnying on his own side."

This is the fundamental principle which underlies the road drag patrol system. It places the responsibility upon the particular road patrolman in charge of a small road stretch. Everybody living in this patrolman's community must necessarily drive over his section. All the neighbors gradually become educated to the defects as well as to the improvements in their road. They become critical and help hold the patrolman to his job, and they become road enthusiasts. That is what happened in my own community, and it was the road drag patrol that turned the trick. And what was done in our township can be done in any other of our 1,600 Pennsylvania townships; it does not matter how bad and hopeless you may consider your own home roads to be. First of all, our soil is a heavy loam. There is a goodly mixture of sticky clay scattered thru it.

The first year I applied the road drag patrol system it cost the township $30 per mile. This was my first year's service as township road supervisor. I was green at the job. I did not put the road grader on in my division of the township. In fact, I ordered it kept off. This was a mistake. I shall discuss the good and bad points of the road grader in the next article. As a general proposition it is useless to expect a simple little road drag to perfect a road that is totally undrained. In many cases it can be done but the sphere of the road drag is in maintenance and not in the realm of construction.

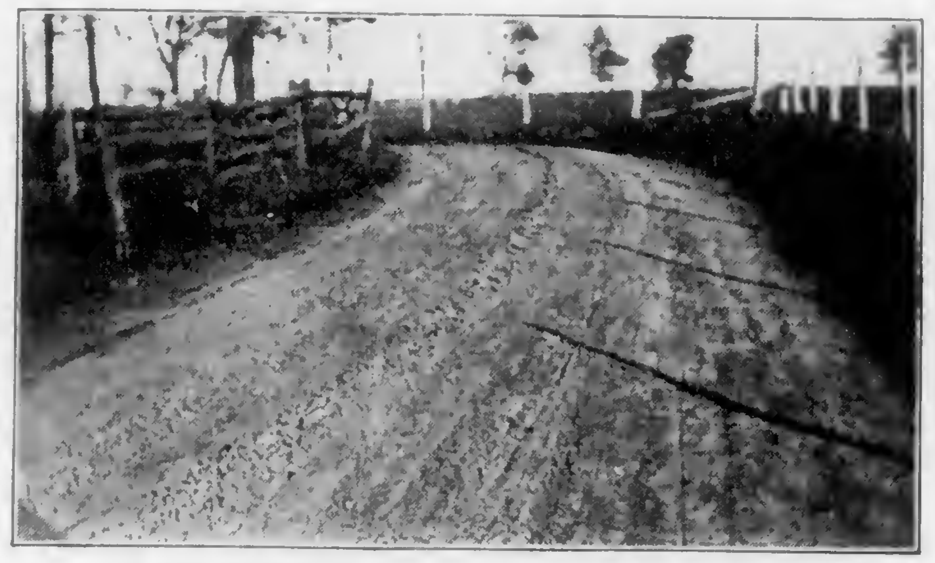
In the second year of the road drag patrol the total expense was within a few cents of $12 per mile. I could not get my two colleagues on the Board to keep any detailed accounts of their work, whereas I kept exact duplicate accounts of all expenses of all the road drag patrolmen in my Division. East Lampeter was divided into three divisions, each division being in charge of a Supervisor. I was in charge of Division No. 3. I had 20 miles of earth road which was being dragged according to contract by the farmers who lived along the roads, and who acted as road patrolmen. We paid each patrolman 40 cents per hour for his dragging. We did not care whether he used two or four horses. His job was to drag and use his wits as to the best times to get on the road after a rain, or during a thaw. He was instructed to keep dragging every day in the year if he thought his workmanship could make the road better. The matter of keeping his time was up to him. Of course a few patrolmen tried to pad their time sheets at first, but the public opinion of the community soon brought this type of workman to realize that "honesty was the best policy."

During the third year, our road patrol cost $93 to keep 20 miles thoroly dragged during the entire 12 months of the year, or a trifle less than $5 per mile. Our roadways were then profiting by the two years' previous dragging. There were no standing puddles and no deep ruts. Single-trees were not broken so often, harness repair bills were lower for the farmer and it was decidedly easier on the teams to haul produce to market. It would be intensely interesting if exact records of expenses among the farmers could have been kept during these years, as to saving in money from harness and general team repairs, to say nothing of veterinarian bills. The only practicable way that such a community record could be kept would be for 25 or 30 farmers living and traveling a patrolled roadway to keep a record of their expenses "Before" and "After". There is not a doubt that a decided saving would be found.

A few months after I had inaugurated the road drag patrol system in my Division a number of the farmers in the two other divisions hunted up my colleagues in charge of those roads and requested that they be permitted to drag their roads as official patrolmen. As a result, our township soon had its network of earth roads—42 miles of them—being regularly patrolled by 36 road dragging farmers, and our township earth roads were soon transformed to respectability. The medicine that worked the cure was road dragging thruout the entire year. Before this period our roads showed an absence of crown, an utter absence of side ditches and an utter lack of drainage except the wash gulley down the middle where the hoofs of the horses had worn a trail. After three years the road drag patrolmen had brought about a good contour, a firm foundation, good side gutters which absolutely prevented sink holes and seep-spots.

The road patrol had worked a transformation. The constant care during the entire twelve months of the year had kept the moisture out of the middle of the road. There was little water to freeze during the cold weather and the road's foundation was not greatly disturbed by thawing. Of course, some patrolmen were more earnest, conscientious and intelligent than others. You will find such conditions prevailing wherever human labor must be employed, but persistence won, and what was accomplished here can likewise be accomplished in any other county of our Keystone State. Even the sections of the more careless farmers were in passable shape for nearly the entire year, whereas the neglected and undragged roads outside of the township were in the distressing condition so well known to all of us.

As regards permanency, it is asking too much of a King drag to absolutely perfect an undrained road. It is a most suprising thing, however, to see what the drag actually can do towards improving and maintaining an already drained road. It is not necessary to wait for drainage, however, before using the drag. It can never do anything but good except when the ground is sticky. During this stage you must keep off the roadway unless tests show that the soil of your community will be improved by dragging at such times. The quality of soil must be considered in working the road drag, and in considering this it is well to remember that the best and quickest way to learn is to go ahead and try things out. If you do not experiment you will never know. Let me urge every Pennsylvania Farmer reader who wants prompt and good road improvement in his community to drive a road drag. Get on the drag yourself. Start in to drag, no matter how rough the road. Learn how first. If the rear slab flies up and throws you off, get your wife out to help you. She can do as my wife did. She can sit on and help hold down the rear slab until you learn how to manage the tool yourself. Our wives and daughters interested in the modern suffragette movement need not confine their activities to politics. They can easily learn to become road drag suffragetts. My wife tackled the job and has won out.



SHORT STRETCH OF DRAG PATROLLED EARTH ROAD.

The chief drawback to the road drag is its simplicity. Lots of men start to work a drag and for various reasons get tired or discouraged. These men oftentimes make first-rate road patrolmen if they are properly encouraged and shown how to do their work and a proper incentive is offered for their interest and efficiency. There are all sorts and varieties of drags. A road supervisor in Bradford County told me recently that he has been using two old pieces of railroad iron as a drag. The iron is joined together by one-inch iron bars, the rails measuring five feet long, and the whole drag weighing between two and three hundred pounds. While I am firmly opposed to so much weight in a road drag, this one has the advantage in that it never wears out. But I would rather wear out a light wooden drag that can be pulled easily by two horses, once every two years, than make my team pull so hard dragging such an excess weight.

There are makers of other forms of iron road drags. Each man who drags a roadway will find a preference. Personally I like the light chestnut wood drag the best; one having its slabs about five feet long. Very often a smaller drag, with three-foot slabs, can be used to good advantage in working in the side gutters. It will all depend upon the kind of dragging you want to do and where you must do it. When you learn how to prevent your drag from catching on a stone or in a rut and when you learn how to hang on and at the same time drive the team so as to make the drag cut off a little here and drop a little earth there, as needed, things will go easily. By learning the trick from the beginning, and studying how to make your drag do better and better work, you soon become very expert in its use. The usual fault with a man who starts to drag is that he just stands on and does not study how to throw his weight so as to control the cutting.

"Sammy" Petershime, the Amishman whom I have spoken of in a previous chapter, has four distinct kinds of road drags. He uses each for special purposes, along certain parts of his road. It all depends on what result he wants to accomplish. Patrolman Wilmer Conrad, whose section extends one-half a mile, thought he would like an iron drag. He procured one, but promptly went back to his old-fashioned and light chestnut drag; and Mr. Conrad won the third prize of 85 1-3 points in our big township road inspection, just three points below the second prize winner and 14 2-3 points below the first. In a future article I shall describe how these road patrolmen looked after their road sections to win their respective positions in the prize road-dragging contest.

Roads are meant to be ordinarily respectable, so that we can get about over the country. Just money will not do this. It requires something more than cash. It takes a man who will get behind the thing to check matters up, to be awake to who is and who is not delivering the goods; to weed out the incompetents and to increase the responsibility and the wages of the proven workers and it requires a responsive citizenship back of this man. Each Pennsylvania Farmer reader can do a lot to get our road control back to where it can best be looked after and efficiently applied. Get your neighbors into line and organize your road efforts when your farmer clubs and public meetings are held. Cut out petty jealousies. Line up your local business men. Get your automobile club, your merchants' association, your granges and all other progressive organizations together. Band yourselves into a body of road betterment workers, with the "Eagle Eye." Inject a little fun into the job. Learn what can be done financially. Discuss what ought to be done. Decide what you will undertake. Then—stay with it, and if your local supervisors still hold off, keep after them. Get as many farmers as you can to start a road drag to patrol the road by their own farm. Get the township to pay for such service if possible. If not, start anyway. Then give all the facts to the newspapers as you actually accomplish something. Do not bother the papers until you really do something. They want news, not enthusiastic prospective plans. Keep your newspapers posted as your future road work progresses. They are 90 percent. necessary in keeping alive the good spirit of your road work, and in keeping the township folks thoroly posted as to what is what.

MARKET HAY

Farmers' Bulletin 508, Washington, D. C. states: "The demand for market hay is for better grades than those with which the market is now supplied, and the remedy for these conditions lies largely in improved meadow management, curing methods and baling processes.

Grange

McSPARRANS' GRANGE NOTES

The New Currency Law

To those of us who have not given the question of money sufficient study to become experts on the subject, it is a great satisfaction to notice that the names of so many of those congressmen whom we have known as progressive in all parties are recorded in favor of the new law. The bill was proposed as a party measure, and was engineered thru congress under the lead of the party caucus. It has not been many years since under like circumstances the bill would have received scarcely a vote beyond that of the party which was its sponsor. One of the hopeful things in present-day politics is the fact that the party is not considered the chief thing, and the policy a secondary consideration.

And while the partisan may be able to claim the new law as a party victory, those of us who are more anxious to see a helpful policy initiated than to note a party victory, have our confidence in the new measure greatly increased because so many of the men of all parties who have in the past shown themselves up-to-date statesmen lent their help in amending and formulating and passing the bill.

Because so many of the champions of the new system came from the south and west leads us to believe that it is not a Wall Street measure, in spite of the direct assertion of some of our eastern papers that such was the case. There are some who hold that the control of the regional banks by the bankers is a bad thing. I cannot feel that it would have been just to have located the control anywhere else than in the banks. The banks are required to put about $400,000,000 into these regional banks, and when they and the government put up the money they ought to have representation according to the investment; and the law allows just about that proportional representation.

There is danger that prejudice against the banks has arisen in the minds of many people because the control of our monetary system has heretofore been so largely centered in that financial underworld called Wall Street and other such gambling and stock manipulating centres thruout the country. But we dare not forget that very many banks in both city and country, I dare say a large majority of them, are splendid, honest institutions. Their directors are representative men from the district in which their business lays, and their officers are clean, keen, capable men. So we need not fear the misjudgment of the banker if the new plan will work out to the preventing of the reserves of the banks from being centralized in these stock-gambling places.

There was one thing tho, that was thrown out of the bill in conference that certainly should have remained in if the measure is to become the basis of a strong and steady currency system. That is the guarantee of bank deposits. It was in the bill as it passed the house, but lost out in the senate, and then was lost in conference. There is a move on foot, we understand to have this feature enacted later. We should insist, as farmers, that it shall be enacted. The countryman as a rule is distant from the banks, and if there is a run on the institution, he can not save himself by early withdrawal of his deposit. He needs a thoro system of guarantee of deposit which would stop these damaging runs on banks.

The only objection that seems to be offered against the guarantee is that the strong bank would have to carry the weak, and the safe be required to pay for the wildcat banking house. As to the strong carrying the weak, our observation is that runs and failures are just about as likely to come to the big, apparently strong bank as to the small and apparently weak one, and the average depositor is controlled so largely by convenience in his choice of a bank that the question of their relative strength is scarcely thought of; especially when he has no means of knowing accurately which is the strong one and which the weak, nor which will remain strong. As to the safe bank being responsible for the wildcats, what is the real fact? The stockholders in every National Bank is held for twice the amount of his stock, and of course in any sane guarantee system, this condition would still remain and there would be the same incentive on the part of the stockholders to elect efficient and honest directors and officers as there is at present. The bank examiners would still perform their work of supervision and no doubt more carefully than they do now. Not only that, but the other banks know more about the transactions of a particular bank than does the ordinary depositor, and therefore have more opportunity to correct a mistake in time, or check a policy they see in operation in another bank. The larger responsibility should therefore rest with the greater scope of information.

Then too, aside from all thought of policy expediency, there is the foundation stone of any stable banking system that the whole people must recognize: That money in bank is as safe and sure as a government bond. The people will not believe that so long as they see in the daily papers of this or that bank failing with the liabilities larger than the assets, and the depositors' money gone. We recognize the practicability of life and fire insurance and we must contend for a system of deposit insurance that will bring all money out of hiding and keep it in the channels of trade; not only when business is good and money plenty, but during those inevitable periods when the financial tension is great and the need for those hidden dollars extreme.

In the near future we want to discuss the question that is so much talked of now; namely, Special Banks For Farmers Use."—John A. McSparran.

NEW YORK GRANGE MEMBERSHIP

The New York State Grange will show nearly 3,000 new members added during the fiscal year ending October 1. About 38 new granges have been organized. The total membership in the state is now not far from 107,000.—D

Sussex County Pomona, No. 2, met at Hamburg. According to a statement by a prominent member, the subordinate granges of the county are at a standstill, so far as the securing of new members is concerned. There are plenty of members who pay their dues in order to participate in the insurance department of the organization, but who take no interest in the meetings and no part in the actual work. John H. Voorhees, of the State Experimental Station spoke on the culture of soy beans, recommending their cultivation. Delegates to various pomona granges of adjoining counties were appointed.

It's Easy to Keep Your Shoes Waterproof

without changing their appearance or injuring the leather. Just apply

DRI-FOOT

Waterproofing for Shoes

once in a while. Keeps leather soft, pliable and wear-resisting. Doesn't make them sticky or oily; doesn't prevent polishing. For black or tan.

Get a can from your shoe or general store dealer. If they haven't it, send their names and we'll supply you—25c full size can.

FITZ CHEMICAL CO.

Boys Need Watches

just as much as men do.

Help your boy to get the required number of subscriptions to Pennsylvania Farmer to obtain a dependable watch. Following is our offer:

1 year at 50c............20 points.
2 years at $1.00..........30 points.
3 years at $1.25..........40 points.
5 years at $2.00..........6. points

This is a good dependable watch and better for a boy than higher priced ones, as it will stand a lot of hard usage.

It is 16 size, open face, stem-wind and set, nickel case and a good time-keeper.

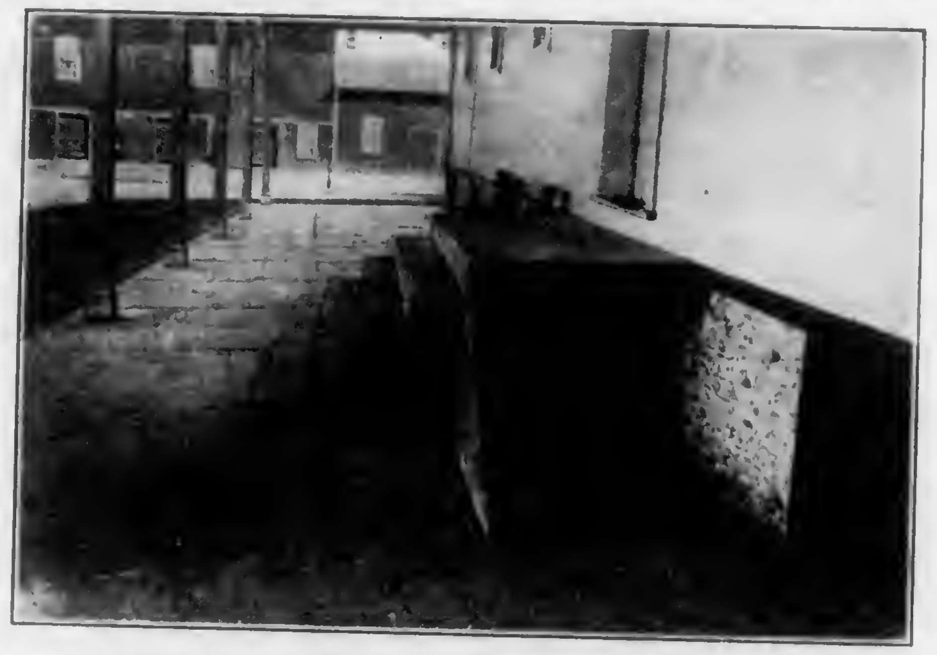
Any bright boy with a little hustle in his makeup can earn this watch in a day or at most two.

PENNSYLVANIA FARMER, 214 South 12th Street, Philadelphia, Pa.

Household

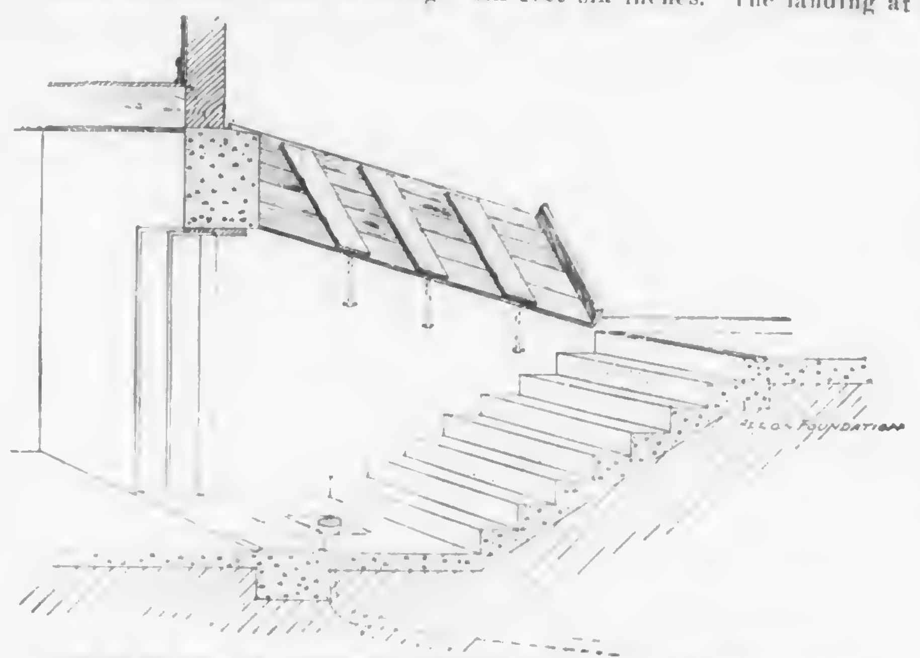
STEPS AND HATCHWAYS OF CONCRETE

An important feature of dwelling construction as it applies to the farm house is a substantial cellarway with watertight walls. It is frequently necessary to convey to and from the cellar materials that are heavy in bulk, and firm steps are essential to safety and convenience. They can be cast in concrete with ease and economy, whether designed for a new or an old building.



CONCRETE HATCHWAY CHEAPLY CONSTRUCTED AND EASILY CLEANED.

With an allowance for a three-foot landing at the bottom of the stairs, excavate the opening to the width of steps desired plus one foot. This extra width is for a six-inch thickness of concrete wall on each side. The steps themselves have a rise of six and a tread of nine inches. Beneath the steps proper is a four-inch thickness of concrete. Therefore provide for this thickness in sloping the ground upward from the landing to the top of the stairs. Extend the trenches for the side and end walls one foot below the concrete of the steps. As forms choose two 1 by 12-inch boards and notch them as though they were to be used as "horses" to support wooden steps of the same dimensions as those of concrete. Place the notched edges down with the ends fixed at the top and bottom of the stairs. To mold the rise of the concrete steps, use 1 by 6-inch boards 3 feet 10 inches long, which are secured to the forms by means of nails and wooden cleats.



CROSS-SECTION OF CONCRETE HATCHWAY, SHOWING CONSTRUCTION.

With the forms firmly fixed in position, fill the mold for the bottom step, and the space back of it, with concrete proportioned 1 bag of Portland cement to 2 cubic feet of sand to 4 cubic feet of crushed rock. If bank gravel is used mix the concrete 1 part cement to 4 parts gravel. Bring the concrete in each step to the top of the riser and finish the surface with merely a wooden float. Continue the work upward until all the steps are finished. At the top of the stairs tie the apron foundation to the side wall by means of old iron rods imbedded in the concrete and extending around the corners. This will prevent possible heaving and cracking by frost.

The side forms of the six-inch walls are then erected and are thoroly cross-braced against each other. For these forms use 1-inch siding on 2 by 4-inch studding spaced two feet apart. The walls can be carried to any height desired so as to give the cellar doors sufficient slope for shedding rain-water. Above ground line, outside forms must be provided. Fill the walls with concrete mushy wet. Before the concrete sets, bolts are placed (heads down and washered) in the top of the side walls for holding the wooden sills to which the cellar doors are hinged. After two to four days the forms can be removed. Connect up the drain in the landing and lay the landing floor.

The eight cellar steps of the hatchway shown in the plan have a tread of nine inches, a rise of six inches and a length of four feet. The clear height of the door-way in the cellar wall is six feet six inches. The landing at the foot of the steps is three by four feet and has a four-inch concrete floor. This same thickness of concrete lies under the steps proper. The side walls were built as described above. For this improvement there were required the following quantities of materials.

Bill of Materials.—Crushed rock, 2¼ cubic yards; sand, 1¼ cubic yards; Portland cement, 12 bags.

For improving old cellar hatchways it is frequently necessary to fill with earth and gravel so as to provide the earthen slope for the concrete steps. Such filling must be thoroly tamped into place and should be water-soaked and allowed to settle before the steps are built.

Concrete steps, unlike other kinds, become stronger with age. They are perfectly safe under the heaviest of loads. Moreover, besides being water-tight, they keep out rats, mice and other obnoxious vermin.

NUTRITIVE VALUE OF NUTS

Marion Harris Neil

Nuts are not generally used in cookery as they should be, for they are admitted to rank high as brain and nerve foods and thus furnish a valuable contribution to the comparatively limited range of vegetarian dietary. Bulk for bulk they are among the most nutritive foods we possess. They contain 15 to 20 percent nutritive qualities and 50 to 60 percent of fat. No other vegetable substance is as rich in fats. They are as rich in nutritive value as butter and decidedly more economical. Nut butter contains proteid as well as fat, and therefore is compared to cream rather than butter. Today everyone knows or ought to know, that nuts must be eaten with salt to assist in their digestion. Then, if thoroly masticated, they may be eaten raw by almost anyone, while cooked in an infinite number of ways, they add variety as well as piquancy to the dietary.

Peanuts afford twice as much nourishment as beefsteak, rice, beans, or cheese, and eight times as much as potatoes. Next to the peanut, which, accurately speaking, is not a nut at all, but a member of the nutritious "pulse" family, is the chestnut, which is so starchy as to be almost a bread. Chestnuts are used in soups, sauces, purees, forcemeats, entrees, and all manner of sweet dessert dishes. Fresh sweet almonds are exceedingly nutritive, but as the outer brown skin sometimes causes irritation of the bowels, they are far more digestible when blanched. This is done very quickly by covering the nut meats with boiling water, letting them stand for four minutes, then rubbing off the brown skins between the thumb and forefinger. When dried and salted in the oven, the almond makes an excellent digester, three of them carefully masticated frequently relieving indigestion from other causes.

Next in nutriment value are the hickory nuts, pecans, and English walnuts. The black walnut, which is stronger in flavor, is growing in favor for cakes, pickles and salads. Pistachio seeds or nuts are now being imported in increasing quantities. At first their use here was restricted to the coloring and flavoring of ices, creams, and candies, but now the little green kernels inclosed in shell-shaped covers are roasted in the oven with salt, then used on the table as digesters. The great fondness of the Turks and Greeks for these nut seeds is said to be the reason why they were so slow in making their way into commerce.

Some Recipes

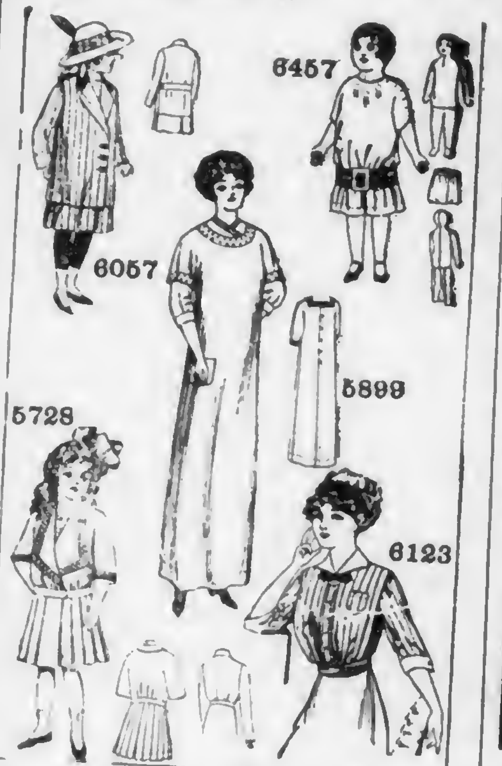
Almond Soup.—Blanch and pound a quarter of a pound of almonds, then boil for one hour in one and a half pints of white stock, one teaspoonful of whole pepper, one sliced onion, one head of celery cut into small pieces, then rub thru a sieve. Blend together in a saucepan one heaping tablespoonful of butter with one tablespoonful of flour. When smooth, add gradually one and a half pints of milk, stir till boiling, then add the stock and one teaspoonful of salt and allow to heat. Put half a cupful of cream in a tureen and then add the soup to it and serve at once.

Walnut Cake.—Cream half a cupful of butter with two heaping tablespoonfuls of sugar, then add the yolks of two eggs well beaten with a little water, add seven heaping tablespoonfuls of flour mixed with one teaspoonful of baking powder, two tablespoonfuls of chopped walnuts, one tablespoonful of chopped almonds, and half a teaspoonful of pistachio extract. Bake in a flat, round, or oblong cake tin in a moderate oven till a light golden brown color. Heat half a gill each of milk and cream, the well beaten yolks of three eggs, and three tablespoonfuls of sugar. When this is quite hot (but not boiling), lift the pan from the fire and stir in the stiffly beaten whites of the eggs and four tablespoonfuls of finely chopped walnuts. Cover this cake evenly with this mixture, then put in the oven till set.

Hickory Nut Cake.—Cream half a cupful of butter with three-fourths of a cupful of sugar, then stir in the stiffly beaten whites of three eggs, and beat till light and smooth; add half a cupful of milk, and one and a half cupfuls of flour, alternately, then add three-fourths of a cupful of chopped hickory nuts, one teaspoonful of cream of tartar, one teaspoonful of vanilla extract, and half a teaspoonful of baking soda dissolved in a little milk. Mix lightly together and pour into a well buttered and floured cake tin and bake in a moderate oven.

PENNSYLVANIA FARMER PATTERNS.

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.



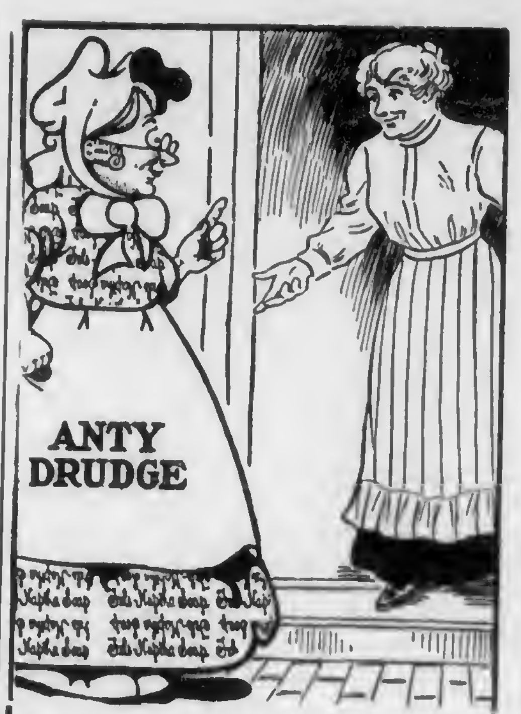
6057—Girls' Suit.—Cut in sizes 6 to 12 years. Age 8 years requires 3¾ yards of 36-inch material and ⅜ yard of 24-inch velvet. Price of pattern 10 cents.

5899—Ladies' Work Apron, with or without Seam at Front.—Cut in sizes 32, 36, 40 and 44 inches, bust measure. Size 36 requires, without front seam, 5¼ yards of 36-inch material. Price, 10 cents.

6457—Rag Doll with One-Piece Dress and Bloomers.—Cut in sizes 16, 20 and 24 inches long. To make the doll in the 20-inch size it requires ¾ yard of 36-inch material. The dress and bloomers require 1¼ yards of 36-inch material and 1 yard of ribbon. Price, 10 cents.

5728—Girls' Dress.—Cut in sizes 6 to 12 years. Age 8 requires 3⅜ yards of 36-inch goods, with 2⅜ yards of braid and 2¼ yards of insertion. Price, 10 cents.

6123—Ladies' Shirt Waist.—Cut in sizes 34 to 42 inches, bust measure. Size 36 requires 2¼ yards of 36-inch material. Price, 10 cents.



Mrs. Comfield: "Good afternoon, Anty. Come in. I was just having a laugh to myself remembering what Tom read to me this morning while I finished my washing. It was about an old rooster leaning up against a tree, saying to himself 'Only an egg yesterday, and a feather duster tomorrow.' I remember that's just about as hopeless as I used to feel before you told me about Fels-Naptha Soap—but I'm a different woman now!"

You can do your work easily and pleasantly with the help of Fels-Naptha Soap. You can have time for rest and strength for pleasure.

Fels-Naptha makes dirt disappear, takes out all kinds of stains, even stubborn blood stains. For your weekly wash put clothes to soak with Fels-Naptha Soap in cool or lukewarm water for 30 minutes; then rub them lightly, rinse and they will be hanging on the line in less than half the time it used to take.

Just as good for all kinds of housework and just as easy if you follow the directions on the red and green wrapper.

Better buy it by the box or carton

Fels & Co., Philadelphia.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

SYNOPSIS OF PREVIOUS CHAPTERS.

Farmer Winston, having failed as a homesteader, desperate, accepts a proposal to simulate Lance Courthorne, an adventurer. Courthorne and his pals are thus able to carry thru some smuggling operations. In the clash with the police, Courthorne kills Trooper Shannon, leaving evidence pointing to Winston as the murderer. The scene shifts to Silverdale, founded by Colonel Barrington. The Colonel is worried over wheat operations and the coming advent of Lance Courthorne, cousin to Maud Barrington, niece and ward of Colonel Barrington, to claim his share of his father's estate. Maud Barrington is told of Courthorne's past misdeeds. Winston, meanwhile, has pushed on to Montana, being held and later released, for lack of evidence, by a government officer, who discloses the belief on the part of the police, that Winston is the murderer of Trooper Shannon. A letter for Courthorne is opened by Winston. Complying with instructions therein, he meets and confers with a lawyor respecting Courthorne's inherited acres at Silverdsle, and following out his role as simulator of Courthorne, goes to Silverdale and is there received as graciously as could be expected. Some of his actions fail to tally with Courthorne's reputation. He wins the good will of Dane, one of the Colonel's advisers. The real Courthorne, who was supposed to have been drowned during the smuggling adventure, now reappears in Montena, insdvertently learns of his inheritance, and pieces together conclusive evidence that Winston has gone to Silverdale. Courthorne and Ailly Blake, whose life he has blighted, agree to ignore each other's identity. Winston and Maud Barrington, caught by a blizzard while driving to Silverdale, find shelter in a deserted shed over night, where he acts the part of a considerate gentleman. Maud Barrington promises Winston to sow her land in wheat the following spring. Under criticism from the Colonel, Winston begins planting operations. He is commended by Maud Barrington for successful efforts to break the gambling habits of Ferris, a young Englishman, a task undertaken at her request. Courthorne now appears and Winston contracts to advance him money, provided he absents himself immediately. During a fire which threatens the wheat fields Winston is injured. Suspicions point to Ferris as the incendiary. The present instalment continues a discussion as to the best course to pursue with Ferris.

CHAPTER XVII.—(concluded).

"No," she said. "For the sake of the woman who sent him here we must stop short of that."

Then Maud Barrington looked at them both. "There is one person you do not seem to consider at all, and that is the man who lies here in peril through Ferris's fault," she said. "Is there nothing due to him?"

Dane noticed the sternness in her eyes, and glanced as if for support towards Miss Barrington. "I fancy he would be the last to claim it if he knew what we do. Still, in the meanwhile, I leave the affair to your aunt and you. We would like to have your views before doing anything further."

He rose as he spoke, and when he had gone out, Maud Barrington sat down at a writing-table. "Aunt," she said quietly, "I will ask Ferris to come here at once."

It was next day when Ferris came, evidently ill at ease, though he greeted Miss Barrington with elaborate courtesy, and would have done the same with her niece but the girl turned from him with visible disdain.

"Sit down," she said coldly. "Colonel Barrington is away, but his sister will take his place, and after him I have the largest stake in the welfare of Silverdale. Now, a story has come to our ears which if it had not been substantiated would have appeared incredible. Shall Miss Barrington tell it to you?"

Ferris, who was a very young man, flushed, but the color faded and left his cheeks a trifle gray. He was not a very prepossessing lad, for it requires a better physique than he was endowed with to bear the stamp of viciousness that is usually most noticeable on the feeble, but he was distinguished by a trace of arrogance that not infrequently served him as well as resolution.

"If it would not inconvenience Miss Barrington, it would help me to understand a good deal I can find no meaning for now," he said.

The elder lady's face grew sterner, and very quietly but remorselessly she set forth his offense, until no one who heard the tale could have doubted the origin of the fire.

"I should have been better pleased, had you, if only when you saw we knew everything, appeared willing to confess your fault and make amends," she said.

Ferris laughed as ironically as he dared under the eyes which had lost their gentleness. "You will pardon me for telling you that I have no intention of admitting it now. That you should be so readily prejudiced against me is not gratifying, but, you see, nobody could take any steps without positive proof of the story, and my word is at least as credible as that of the interloper who told it to you."

Maud Barrington raised her head suddenly, and looked at him with a curious light in her eyes, but the elder lady made a little gesture of deprecation.

"Mr. Courthorne has told us nothing, she said. "Still, three gentlemen whose worth is known at Silverdale are willing to certify every point of it. If we lay the affair before Colonel Barrington, you will have an opportunity of standing face to face with them."

The lad's assurance, which, so far and no further did duty for courage, deserted him. He was evidently not prepared to be made the subject of another court-martial, and the hand he laid on the table in front of him trembled a little.

"Madam," he said hoarsely, "if I admit everything what will you do?"

"Nothing," said Maud Barrington coldly. "On condition that within a month you leave Silverdale."

Ferris stared at her. "You can't mean that. You see, I'm fond of farming, and nobody would give me what the place cost me. I couldn't live among the outside settler fellows."

The girl smiled coldly. "I mean exactly what you heard, and, if you do not enlighten them, the settlers would probably not object to you. Your farm will be taken over at what you gave for it."

Ferris stood up. "I am going to make a last appeal. Silverdale's the only place fit for a gentleman to live in Canada, and I want to stay here. You don't know what it would cost me to go away, and I'd do anything for reparation—send a big check to a Winnipeg hospital and starve myself to make up for it if that would content you. Only, don't send me away."

His tone grew almost abject as he proceeded, and while Miss Barrington's eyes softened, her niece's heart grew harder because of it, as she remembered that he had brought a strong man down.

"No," she said dryly. "That would punish your mother and sisters from whom you would cajole the money. You can decide between leaving Silverdale, and having the story, and the proof of it, put into the hands of Colonel Barrington."

She sat near an open window regarding him with quiet scorn, and the light that shone upon her struck a sparkle from her hair and set the rounded cheek and neck gleaming like ivory. The severity of her pose became her, and the lad's callow desire that had driven him to his ruin stirred him to impotent rage in his desperation. There were gray patches in his cheeks, and his voice was strained and hoarse.

"You have no mercy on me because I struck at him," he said. "The one thing I shall always be sorry for is that I failed, and I would go away with pleasure if the horse had trampled the life out of him. Well, there was a time when you could have made what you wished of me, and now, at least, I shall not see the blackleg you have showered your favors on drag you down to the mire he came from."

Maud Barrington's face had grown very colorless, but she said nothing, and her aunt rose and raised the hammer of a gong.

"Ferris," she said. "Do you wish to be led out by the hired men?"

The lad laughed, and the hideous merriment set the white-haired lady's nerves on edge. "Oh, I am going now, but, for once, let us be honest. It was for her I did it, and if it had been any other man I had injured, she would have forgiven me."

Then with an ironical farewell he swung out of the room, and the two women exchanged glances when the door closed noisily behind him. Miss Barrington was flushed with anger, but her niece's face was paler than usual.

"Are there men like him?" she said.

Miss Barrington shook off her anger, and rising, laid a gentle hand on her niece's shoulder. "Very few, I hope," she said. "Still, it would be better if we sent word to Dane. You would not care for that tale to spread?"

For a moment the girl's cheeks flamed, then she rose quietly and crossed the room.

"No," she said, and her aunt stood still, apparently lost in contemplation, after the door swung softly to. Then she sat down at the writing table. There was very little in the note, but an hour after Dane received it that night, a wagon drew up outside Ferris's farm. Two men went quietly in and found the owner of the homestead sitting with a sheaf of papers scattered about the table in front of him.

"Come back tomorrow. I can't be worried now," he said. "Well why the devil don't you go?"

Dane laid a hand on his shoulder. "We are waiting for you. You are coming with us!"

Ferris turned, and stared at them. "Where to?"

"To the railroad," Dane said dryly. "After that you can go just where it pleases you. Now, there's no use, whatever, making a fuss, and every care will be taken of your property until you can arrange to dispose of it. Hadn't you better get ready?"

The grim quietness of the voice was sufficient, and Ferris, who saw that force would be used if it was necessary, decided that it was scarcely likely his hired men would support him.

"I might have expected it!" he said. "Of course, it was imprudent to speak the truth to our leader's niece. You know what I have done?"

"I know what you did the night Courthorne nearly lost his life," said Dane. "One would have fancied that would have contented you."

"Well," said Ferris, "if you would like to hear of a more serious offense, I'll oblige you."

Dane's finger closed on his arm. "If you attempt to tell me, I'll break your head for you."

Next moment Ferris was lifted from his chair, and in less than ten minutes Dane thrust him into the wagon, where another man, who passed a hand thru his arm, sat beside him. It was a very long drive to the railroad, but few words were exchanged during it, and when they reached the settlement one of Ferris's companions mounted guard outside the hotel he found accommodation in, until the Montreal express crawled up above the rim of the prairie. Then both went with him to the station, and as the long cars rolled in Dane turned quietly to the lad.

"Now, I am quite aware that we are incurring some responsibility, so you need not waste your breath," he said. "There are, however, lawyers in Winnipeg, if you fancy it is advisable to make use of them, and you know where I and Macdonald are, if you want us. In the meanwhile, your farm will be run better than ever it was in your hands, until you dispose of it. That is all I have to tell you, except that if any undesirable version of the affair gets about, Courthorne or I will assuredly find you."

Then there was a scream of the whistle, and the train rolled away with Ferris standing white with fury on the platform of a car.

In the meanwhile Maud Barrington spent a sleepless night. Ferris's taunt had reached its mark, and she realized with confusion that it was the truth he spoke. The fact that brought the blood to her cheeks would no longer be hidden, and she knew it was a longing to punish the lad who had struck down the man she loved that had led to her insistence on the former leaving Silverdale. It was a difficult admission, but she made it that night. The outcast who had stepped out of the obscurity, and into her peaceful life, had shown himself a man that any woman might be proud to mate with, and, tho he had said very little, and now and then his words were bitter, she knew that he loved her. Whatever he had done, and she felt against all teachings of her reason that it had not been evil, he had shown himself the equal of the best at Silverdale, and she laughed as she wondered which of the men there she could set in the balance against him. Then she shivered a little, remembering that there was a barrier whose extent he alone realized between them, and wondered vaguely what the future would bring.

It was a week or two before Winston was on his feet again, and Maud Barrington was one of the first to greet him when he walked feebly into the hall. She had, however, decided on the line of conduct that would be most fitting, and there was no hint of more than neighborly kindliness in her tone. They had spoken about various trifles when Winston turned to her.

"You and Miss Barrington have taken such good care of me that if I consulted my inclinations I would linger in convalescence a long while," he said. "Still, I must make an effort to get away tomorrow."

"We cannot take the responsibility of letting you go under a week yet," said Maud Barrington. "Have you anything especially important to do?"

"Yes," said Winston, and the girl understood the grimness of his face. "I have."

"It concerns the fire?"

Winston looked at her curiously. "I would sooner you did not ask me that question, Miss Barrington."

"I scarcely fancy it is necessary," said the girl, with a little smile. "Still, I have something to tell you, and a favor to ask. Ferris has left Silverdale, and you must never make any attempt to discover what caused the fire."

"You know?"

"Yes," said Maud Barrington. "Dane, Macdonald, and Hassal know, too, but you will not ask them, and if you did they would not tell you."

"I can refuse you nothing," said Winston with a laugh, tho his voice betrayed him. "Still, I want a quid pro quo. Wait until Ferris's farm is in the sale list and then take it with the growing crop."

"I could not. There are reasons," said the girl.

Winston gazed at her steadily, and a little color crept to his forehead, but he answered unconcernedly, "They can be over-ridden. It may be the last favor I shall ever ask of you."

"No," said Maud Barrington. "Anything else you wish, but not that. You must believe, without wondering why, that it is out of the question!"

Winston yielded with a curious smile. "Well," he said, "we will let it drop. I ask no questions. You have accepted so much already without understanding it."

CHAPTER XVIII.

With The Stream

It was Winston's last afternoon at the Grange, and almost unpleasantly hot, while the man whose vigor had not as yet returned to him was content to lounge in the big window-seat listlessly watching his companion. He had borne the strain of effort long, and the time of his convalescence amid the tranquillity of Silverdale Grange had with the gracious kindliness of Miss Barrington and her nice been a revelation to him. There were moments when it brought him bitterness and self-reproach, but these were usually brief, and he made the most of what he knew might never be his again, telling himself that it would at least be something to look back upon.

Maud Barrington sat close by, glancing thru the letters a mounted man had brought in, and the fact that his presence put no restraint on her curiosly pleased the man. At last, however, she opened a paper and passed it across to him.

"You have been very patient, but no doubt you will find something that will atone for my silence there," she said.

Winston turned over the journal, and then smiled at her. "Is there anything of moment in your letters?"

"No," she said, with a little laugh. "I scarcely think there is—a garden party, a big reception, the visit of a high official, and a description of the latest hat. Still, you know, that is supposed to be enough for us."

"Then I wonder whether you will find this more interesting: 'The bears made a determined rally yesterday, and wheat moved back again. There was later in the day a rush to sell, and prices now stand at almost two cents below their lowest level.'"

"Yes," said Maud Barrington, noticing the sudden intentness of his pallid face. "I do. It is serious news for you?"

"And for you! You see where I have led you. Ill or well, I must start for Winnipeg tomorrow."

Maud Barrington smiled curiously. "You and I and a handful of others stand alone, but I told you I would not blame you wether we won or lost. Do you know that I am grateful for the glimpses of the realities of life that you have given me?"

Winston felt his pulses throb faster, for the girl's unabated confidence stirred him, but he looked at her gravely. "I wonder if you realize what you have given me in return? Life as I had seen it was very grim and bare—and now I know what, with a little help, it is possible to make of it."

"With a little help!" said Maud Barrington.

Winston nodded, and his face which had grown almost wistful hardened. "Those who strive in the pit are apt to grow blind to the best—the sweetness and order, and all the little graces that mean so much. Even if their eyes are opened, it is usually too late. You see, they lose touch with all that lies beyond the struggle, and without some one to lead them they cannot get back to it. Still, if I talk in this fashion you will laugh at me, but every one has his weakness now and then—and no doubt I shall make up for it at Winnipeg tomorrow. One can not afford to be fanciful when wheat is two cents down."

Maud Barrington was not astonished. Tireless in his activities and, more curious still, almost ascetic in his mode of life, the man had already given her glimpses of his inner self and the vague longings that came upon him. He never asked her pity, but she found something pathetic in his attitude, for she found that the stress and the turmoil alone could be his. Why this was so she did not know, but with a confidence that could not be shaken now, she felt it was thru no fault of his. His last words, however, showed her that the mask was on again.

"I scarcely fancy you are well enough, but if you must go, I wonder whether you would do a good turn to Alfreton?" she said. "The lad has been speculating—and he seems anxious lately."

"It is natural that they should bring their troubles to you."

Maud Barrington laughed. "I, however, generally pass them on to you."

A trace of color crept into the man's face, and his voice was a trifle hoarse as he said, "Do you know that I would ask nothing better than to take every care you had, and bear it for you?"

"Still," said the girl, with a little smile, "that's very evidently out of the question."

Winston rose, and she saw that one hand was closed as he looked down upon her. Then he turned and stared out at the prairie, but there was something very significant in the rigidity of his attitude, and his face seemed to have grown suddenly careworn when he glanced back at her.

"Of course," he said quietly. "You see, I have been ill, and a little off my balance lately. That accounts for erratic speeches, tho I meant it all. Colonel Barrington is still in Winnipeg?"

"Yes," said the girl, who was not convinced by the explanation, very quietly. "I am a little anxious about him, too. He sold wheat forward, and I gather from his last letter has not bought it yet. Now, as Alfreton is driving in tomorrow, he could take you."

You Should *Not* Worry!

Cheat Dull Care with a Pipeful of Tuxedo Happiness

MANY a man has smoked himself into good humor and a cheerful day's work. That's the reason on a *rainy* day, that good old Tuxedo sells in *double* quantities.

Tuxedo is a mild, sweet tobacco that will do you good through and through—it'll warm the cockles of your heart—clear your brain—and put the "get-there" into your job.

Athletes, doctors, thousands of prominent men of all kinds tell us this; they know what they are talking about.

Tuxedo

The Perfect Tobacco for Pipe and Cigarette

is made *just exactly right* for the man who wants a *soothing* smoke. It is *mild* and wholly *beneficial*. A product of the gentle, mellow, sweet-smoking Old Kentucky Burley leaf.

You can smoke a pound of it and it *won't burn your tongue* or cause irritation in any way. The *original* "Tuxedo Process" has removed the bite and sting. This secret process has been imitated of course. But it was the *first* in the field—and is still the *best*.

Next time the worry-wolf starts chewing the Welcome off of your doormat, sic Tuxedo on him. He'll sure vanish into thin air with the sweet cloud of smoke.

PHILADELPHIA LIVE STOCK.

Philadelphia, Pa., Jan. 5, 1914.

Beef Cattle.—The general market was inactive and somewhat disappointing, and tho supplies were rather light they were fully ample for all requirements. Ohio, Illinois and Kentucky cattle were on sale. Cows of the better sorts closed firmer and calves under limited arrivals ruled firm.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,098	7,432	5,289
Previous week	2,718	8,982	4,577

Best steers	$8.50@8.65
Best steers	$8.65@8.75
Choice steers	8.40@8.50
Good	8.20@8.30
Medium steers	7.75@8.00
Common steers	7.40@7.50
Bulls	5.25@6.70
Fat Cows	6.20@6.75
Medium cows	4.75@5.75
Thin cows	2.75@4.00
Milk cows	45.00@80.00

Veal calves firm. Receipts for past week were 1,029 as compared with 607 a week ago.

Best calves	$11.50@12.00
Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do.	6.50@7.00
Culls	5.00@8.00

Sheep and Lambs.—Desirable lambs closed at an advance, with the top of the sheep market, including heavy, fat ewes, a fraction stronger. There was very little doing, however, and supplies were not liberal.

Choice wethers	$5.00@5.75
Good do.	4.50@4.75
Common to medium	2.00@3.50
Ewes, fat	4.50@5.00
Extra lambs	8.50@8.75
Good to choice do.	8.00@8.50
Common to medium	5.50@7.75

Hogs.—Values were well sustained at the current range, with demand fairly seasonable. Western, as to size and quality are quoted at $11.50@11.75.

City Dresed Stock—Every variety of choice and prime meats closed steady at quotations; trade being about normal. Steers, 11@13½c; heifers, 10@13c; cows, 8@11c. Veal calves, 14@15c; country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@10c; extra wethers, 10½c. Spring lambs, 13@14c. Extras, 16c. Hogs, 11¾@12c.

PITTSBURGH LIVE STOOK.

Pittsburgh, Pa., Jan. 5, 1914.

Cattle.—With a supply of 80 loads on sale the market opened slow at about steady prices but later became active with prices generally 10 to 15 cents per cwt. higher on all grades. Not many light, low-priced cattle on sale here, the bulk being on medium weight order. Heifers and fat cows sold at about the same advance as steers while bulls were steady to strong. Today's supply was 120 cars. Market ruled steady to easy.

Good to choice	$8.60@8.75
Good 1,300-1,400 lb.	8.30@8.55
Medium to good 1,200-1,300 lb.	7.85@8.10
Tidy 1,050-1,150 lb.	8.10@8.25
Fair to medium, 900-1,100 lb.	7.00@7.60
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700-900 lb.	5.00@6.00
Common to good fat bulls	5.00@7.35
Common to good fat cows	4.00@6.50
Heifers	5.25@7.75
Bologna cows	3.00@3.75
Fresh cows and springers	25.00@90.00

Calves.—Veal calves in light supply all week and market closed steady. Today's supply was 500 head, and market ruled steady.

Heavy and thin calves	$5.00@ 7.00
Veal calves	8.00@12.00

Sheep and Lambs.—Sheep and lambs have been in light supply and with a good demand the market ruled active and higher, the close on sheep being 35c per cwt. above Monday's prices, while lambs were steady. Today's receipts were 33 double-decked loads. With a good demand the market ruled steady on both sheep and lambs.

Prime wethers	$5.60@5.85
Good mixed	5.15@5.35
Fair mixed ewes and wethers	4.35@4.85
Culls to common	3.00@3.50
Spring lambs	5.50@8.50

Hogs.—The supply of hogs since Monday has been liberal, and with a good demand the market ruled active all week, the close for the week being 10 cents per cwt. higher on heavy hogs and 20 to 25 cents higher on other grades. Today's receipts were 65 double-deck loads, and the market ruled 10 to 15 cents higher than Saturday.

Prime heavy	$8.75@
Prime medium weights	8.75@
Heavy mixed	8.70@
Best heavy Yorkers	8.75@
Light Yorkers	8.75@
Pigs, as to quality	8.70@8.75
Common to good roughs	6.75@7.75

Sheep and lamb receipts, 14,400 head. Market steady.

Sheep	$3.75@5.50
Mixed	6.00@6.75
Culls	3.00@3.50
Spring lambs	7.00@8.50

Hog receipts 7,400 head. Market firm. Choice, $8.60@8.75; roughs, $7.50@7.75.

BUFFALO LIVE STOCK

Buffalo, N. Y., Jan. 5, 1914.

Cattle.—The high opening Monday and the light supply gave a good tone for the week on the desirable grades. All butcher grades were in good demand but stockers and feeders were in light demand. On the close the market was steady under fair demand. Arrivals in the yards this morning numbered 120 loads. The market was 10@15c higher on all grades.

Choice heavy steers	$8.60@8.90
Medium	7.90@8.50
Yearlings	7.50@8.00
Handy butchers	7.60@8.35
Good to choice fat cows	6.25@7.00
Good to choice heifers	7.00@7.75
Butcher bulls	4.25@7.00
Feeders	5.00@7.00
Stockers	4.00@7.10
Roughs	7.50@7.60
Cows and springers	30.00@90.00

Calves.—The Monday supply was light and the market firm on the basis of $12@12.50 for the best veals. The offerings were light on the close and the basis higher, being $11.75@13.25. Receipts were light today and the market firm at last week's quotations.

Choice veals	$12.00@12.50
Lights and thin	6.00@ 8.75

Sheep and Lambs.—The active and higher opening on Monday gave a good tone thruout the week. Yearlings were in good demand and on higher basis. Sheep in active demand. On the close the market was fairly active with lambs a quarter lower and sheep steady.

Choice lambs	$8.50@8.65
Poorer grades	6.50@7.00
Yearlings	6.50@7.05
Wethers	5.75@6.00
Ewes	5.25@5.50
Sheep	4.00@6.00

Hogs.—The hog trade for the week was in good position under good demand.

Heavies	$8.65
Mixed and medium	$8.65@8.70
Yorkers	8.40@8.45
Light Yorkers	8.30@8.35
Pigs	8.70@8.75
Roughs	8.70@8.75
Stags	6.00@7.00

Horses.—Some 360 head were sold this morning. The general demand was fair at steady prices.

CHICAGO HORSE MARKET

Chicago, Jan. 5, 1914.—Horses were marketed so moderately last week that prices were not generally shaded much, despite the restricted general local and shipping demand. Few horses of the better class were offered, and only a limited number of choice heavy drafters went at $260@285 per head, fair to good ones weighing 1,600 lb. or little heavier going at $200@250. Farm work horses were slow of sale at $100@225, sales being mostly below $200. Rough wagon horses brought $165@215, and chunks weighing from 1,425 to 1,550 lb. brought $235@275.—F.

VISIBLE GRAIN SUPPLY

New York, Jan. 5, 1914.

Visible supply of grain:
Wheat, increased 269,000 bushels.
Wheat, in bond, decreased 738,000 bushels.
Corn, increased 4,203,000 bushels.
Oats, increased, 146,000 bushels.
Oats, in bond, increased 172,000 bushels.
Rye, decreased 103,000 bushels.
Barley, decreased 183,000 bushels.
Barley, in bond, decreased 37,000 bushels.

ELGIN BUTTER QUOTATION.

Elgin, Ill., Jan. 5, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 35c a pound.

TOBACCO MARKET

The inconsistency of the government reduction in the appropriation for tobacco experiments from $31,630 to $25,000 is shown by the substantial increase in the already comparatively stupendous sum alloted or the investigation of the cotton boll weevil, a strictly southern crop. The increased sum allowed for this purpose is $378,240 or more than fifteen times that allowed for tobacco. In explanation of the matter it is adroitly suggested that research be "carried on by state and local organizations."

Much less tobacco is stripped than usual at this time of year. The situation is quiet and was made more so by the recent holiday season. However, a few sales of seedleaf were reported in the Manor section. One crop sold at $11, and one at $8 per cwt. A crop of hail-cut Havana sold at $9 and another at $5 per cwt. A large crop of 1912 packing sold at $10 per cwt. All interests are optimistic as to future demand, as it is a well-known fact that the Ohio crop is short and that manufacturers must sooner or later turn to Pennsylvania for supplies. The present outlet is well shown by the recent sale of 1,500 cases by one packer, the same going to a prominent New York firm. Prices for the lot, it is stated, ranged from $14 to $16 per cwt.

In Ohio, buying of the new crop continues at $12 to$13 per cwt. for Zimmer Spanish and $10 for Gebhardt. In New York the superior quality of the new crop is a subject of general comment, and it is gradually being sold at satisfactory prices. In Connecticut the situation is practically the same. In the Wisconsin section unfavorable weather has resulted in the almost total suspension of tobacco operations. Abnoramlly high temperature with fog and rain has resulted in the heating in bulks, and even where hanging, traces of mildew or mold have begun to be seen on stems. At this season of year, however, such a situation is almost sure to be shortlived and no considerable damage is anticipated.

In volume of business the burley section of Kentucky and Ohio is at present much greater than any other section. The various looseleaf markets in this district and the two larger hogshead markets at Louisville and Cincinnati are selling millions of pounds weekly, practically the whole of which is being sold to factory buyers and either shipped there at once or stored for future shipment.—H. E. Tweed, Jan. 5, 1914.

COUNTY NOTES

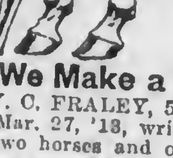
Green Co., Pa., (S.W.) Dec. 26, 1913 —Very unsettled. Live stock very scarce, but in good condition. Sheep 4c per lb.; pigs, from $6 to 9 pair; eggs 35c doz.; butter, 30c; corn, 90c bu. oats, 50c bu.; wheat, $1.00 bu. Owing to the mild weather so far, there will be plenty of feed for the winter.—C. L. Addleman.

Adams Co., Pa., (S.C.) Dec. 29, 1913 —Real winter weather; some snow. Some live stock dying due to eating old musty corn and fodder. Prices of stock high; feed scarce and high. Butter, milk and eggs also a good price. Plenty of work still to do, but weather unfavorable.—R. D. Myers.

Fayette Co., Pa., (S.W.) Dec. 1913.—This has been a very mild open winter. Had only one inch of snow and not very cold weather yet. The butchering season is about over and everybody getting ready for Christmas. Hogs fattened out nicely and went onto the market at 11@13c, dressed. Eggs are still 50c doz. Corn is all gathered. Stover is being hauled. Some are shredding their stover. Some ploughing has been done.—Samuel A. Harris.

McKean Co., Pa., (N.C.) Dec. 1913.—Very light snow and continued warm. Cows $50@75; pork, 12c; apples, $3.50@$5.00 bbl.; potatoes, $1 bu.; hay, retail, $15.50 ton; straw, $9 ton; eggs, 53c doz. for strictly fresh. Butter, 40c lb. Farm work in good condition. Plowing done and manure hauled as made.—M. Ingalsby.

Bradford Co., Pa., (N. E.) Dec. 1913.—Very warm and dry. The yield of milk is about normal on account of very warm weather. Cows have dropped in price a little. Winter grain doing nicely. But one heavy freeze as yet. Roads in fine shape.—L. C. B. roughs.



SAVE-THE-HORSE (Trade Mark Registered.) BOOK FREE

Why We Make a Contract to Cure

Mr. W. O. FRALEY, 502 Fisher St., Salisbury, N. C., Mar. 27, '13, writes: I used 2 bottles and cured two horses and one pony of bone spavin two years ago and they are sound as a dollar.

FOUR YEARS AFTER—STILL SOUND

Mr. H. G. PUTNAM, dealer in Coal, Danvers, Mass., Oct., 6, '13, writes: Four years ago I sent for Save-the-Horse for thoroughpin and made a cure. The horse has done a good day's work almost every day since on coal wagon.

WE ORIGINATED the plan of treating horses Under Signed Contract to Return Money if Remedy fails. You risk nothing by writing; it will cost you nothing for advice and there will be no string to it.

OUR LATEST Save-The-Horse BOOK is our 18 Years' Discoveries—Treating Every Kind Ringbone—Thoropin—SPAVIN—and ALL—Shoulder, Knee, Ankle, Hoof and Tendon Disease—Tells How to Test for Spavin; how to locate and treat 58 forms of LAMENESS—Illustrated.

OUR CHARGES for Treatment ARE MODERATE. But write and we will send our—BOOK—Sample Contract and Advice—ALL FREE to (Horse Owners and Managers—Only).

Druggists everywhere sell Save-The-Horse WITH CONTRACT, or we send by Parcel Post or Express paid.

1913 RECORD Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also name and address of writer. Initials only will be published. When reply by mail is requested, it becomes private practice, and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Indigestion—Loss of Vision—Worms—Seven-year-old mare had distemper very hard last April, got better without any cough or heaves, but does not digest food properly and does not seem to gain in flesh or strength. Unless she is fed oats, bran, a little oil meal and hay, she seems to have colic. Every time I feed her corn it appears to distress her. Sometime ago she was wormy, but failed to find any pass her now. This mare is nervous and high strung and not the kind to lay on flesh rapidly, but she needs treatment. I also have a six-year-old mare that is wholly or partly blind in her right eye. The eye ball is covered with a whitish film and a watery discharge comes from eye occasionally. We also have a two-year-old colt and another six-months-old that are troubled some with worms. How much oats and bran should each of them have? I give them each a box stall, 10 by 12 feet, and yard exercise, 2 or 3 times a week. M. D. S., Union City, Pa.—Give your mare ½ oz. Fowler's solution and 1 dr. ground nux vomica at a dose in feed, 3 times a day. Wash eye with a standard solution of boracic acid, twice a day. I do not believe vision can ever be restored, no matter what doctors may tell you. Mix together equal parts ground gentian, ginger, fenugreek and bicarbonate of soda. Give each colt a teaspoonful or two at a dose in feed, twice a day; also salt them well. Give the two-year-old colt 2 quarts of oats at a feed, 3 times a day, and the six-months-old colt, 1 quart at a feed, twice a day.

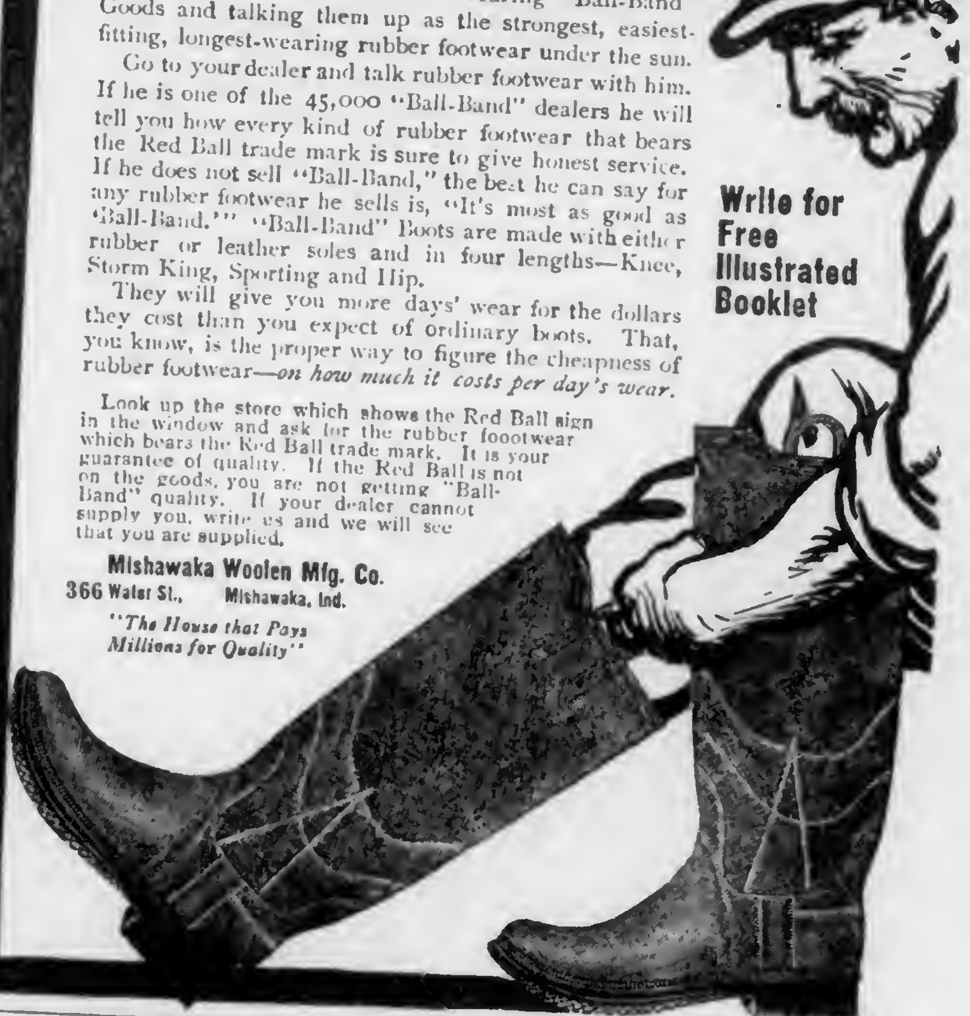
Poor Ration—I have a Berkshire brood sow, about 18 months old, which commenced to show soreness in hind legs some 6 weeks ago. Part of the time I was inclined to believe that she was sore in some fore quarters. A neighbor told me that she had kidney worm and advised me to give her oil of savin which I tried with poor results. Her appetite is good and I feed her a slop of ground wheat, oats and corn. She is not overly fat and has the run of an orchard. F. R. S., Linesville, Pa.—Feed your sow no corn, but give her oats, oil meal and roots. I believe if she had less feed and more exercise it would be better for her. Feeding her corn and wheat has caused her to go wrong. Give her 15 grains sodium salicylate at a dose, 4 or 5 times a day. If her bowels are costive, give her 2 or 3 ounces of castor oil or the same quantity of Epsom salts. She should be kept in a clean, dry and warm place.

Spasm of Larynx.—My young pigs frequently have a sort of fit following the first mouthful they take. After this fitty spell passes off they stagger around a little, then go to eating. These pigs are about two months old. J. T. A., Meadville, Pa.—Your pigs either choke themselves or else the food is too cold, producing spasm of larynx. I am inclined to believe that they choke themselves on the first mouthful of food. Feed them warm semi-sold food and spread it out thin. This will prevent them taking too much food in their mouth at once.

Chapped Teats.—My cows has been troubled for some time with chapped teats. I am anxious to heal them up. Can you give me a good remedy? M. G. T., Oil City, Pa.—Apply equal parts lemon juice and glycerine, or apply equal parts compound tincture benzoin and glycerine to sores, once or twice a day.

THE BEST FARM PAPER

"The Pennsylvania Farmer is the best farm paper published. It is full of meat, not warmed up hash. The articles are practical and to the point; not merely theoretical matter. Every article counts. Every farmer should read it." H. C. Klinger, Liverpool, Pa., Sec. Treas. of the Pennsylvania State Bee Keepers' Association.



A Million Dollars Can't Hire Us to Cheapen the Quality of "Ball-Band" Rubber Footwear

We could use cheaper rubber, hasty methods, less care in making "Ball-Band" Footwear for just a few months and pocket a cool million dollars profit. Why don't we do it?

For the same reason that money can't hire you to cheat your friends—we won't cheat the men who believe "Ball-Band" Footwear is the best their money can buy.

"BALL (Red) BAND" TRADE MARK

It's solid satisfaction as well as good business for us to know that eight million men are wearing "Ball-Band" Goods and talking them up as the strongest, easiest-fitting, longest-wearing rubber footwear under the sun.

Go to your dealer and talk rubber footwear with him. If he is one of the 45,000 "Ball-Band" dealers he will tell you how every kind of rubber footwear that bears the Red Ball trade mark is sure to give honest service. If he does not sell "Ball-Band," the best he can say for any rubber footwear he sells is, "It's most as good as 'Ball-Band.'" "Ball-Band" Boots are made with either rubber or leather soles and in four lengths—Knee, Storm King, Sporting and Hip.

They will give you more days' wear for the dollars they cost than you expect of ordinary boots. That, you know, is the proper way to figure the cheapness of rubber footwear—*on how much it costs per day's wear.*

Look up the store which shows the Red Ball sign in the window and ask for the rubber fooотwear which bears the Red Ball trade mark. It is your guarantee of quality. If the Red Ball is not on the goods, you are not getting "Ball-Band" quality. If your dealer cannot supply you, write us and we will see that you are supplied.

THIS PONY FREE!

"WHITE SOX"

"WHITE SOX" is a beautiful 3-year-old Shetland, almost solid black, with four white "stockings" and long silky mane and tail. He stands about 42 inches high and weighs around 300 pounds. We have already given away 157 ponies to boys and girls who joined our Pony Club and "White Sox" is just as fine as any of these other 157 beautiful ponies. This is saying a great deal when you consider that we go around to all the big pony farms and pick out the very best ponies we can get for children. "White Sox" is as gentle and lovable as any pet could be and is thoroughly broken to ride and drive. Hitched up in his nobby little pony cart, with his nickel trimmed harness flashing in the sunlight he makes the prettiest picture you ever saw. Not only is he pretty, but he can carry along a whole buggy load of happy children at a fast clip—faster than many big horses can. "White Sox" and his elegant outfit, described in the opposite column, can be yours if you are willing to do us a favor. Send us your name today and we will tell you just how to get him. Don't delay, but do just as our 157 happy pony winners did and send us your name at once.

WE WILL GIVE YOU OR SOME OTHER BOY OR GIRL THIS PONY WITH COMPLETE OUTFIT

DO YOU WANT THIS OUTFIT?

SEND US YOUR NAME TODAY

IF YOU WANT TO OWN "WHITE SOX"

THE OUTFIT

ALONG with "White Sox" we send the finest and most complete Pony Outfit that you ever saw. A stylish four wheeled pony buggy—strong and easy riding—a handsome black, nickel trimmed harness and a hand made saddle and Indian horsehair riding bridle. No matter how rich a child's parents might be they could not buy him a better or more complete outfit than we send with "White Sox" to you or some other boy or girl. The horsehair bridle is made especially for us by an old cowboy at Deer Lodge, Montana, and is hand woven out of many-colored horsehair—red, black, yellow, green and white. It is woven into beautiful Indian designs, mounted with fluffy hair tassels, and the reins end in a real cowboy quirt. You will be the first to have one of these bridles in your neighborhood if you send us your name and get "White Sox" and his whole Outfit. We had just as soon send this wonderful Pony and Outfit to you as to any other boy or girl but you must send your name and address right away so we can tell you all about our easy plan. Use the coupon below, and mail it now.

AS soon as we hear from you we will tell you how to go ahead and get "White Sox" for your own. We have a wonderful Pony Club that gives Shetland Ponies to its members and you can join this club without spending a cent of your own money and thus be eligible to get a pony free. Don't let anybody persuade you that you can't get this beautiful little pony and outfit because our plan of giving away ponies is different from others. The fact that we have already given away 157 ponies to boys and girls in 30 different states, from the state of Vermont to the state of California, several going over 1,800 miles from St. Paul, is proof that we give ponies away. The postmaster or banker in your town knows that the Webb Publishing Company of St. Paul, Minnesota, established for more than 30 years, is one of the largest publishing houses in the United States and can afford to give away ponies to advertise its papers. We never heard of one of the 157 members of our Pony Club to whom we have already given ponies until they wrote and told us they wanted a pony and that is why you must send us your name and address at once if you want us to send you "White Sox" and his dandy Outfit.

WE HAVE GIVEN AWAY 157 PONIES

HERE ARE THE NAMES OF A FEW OF OUR 157 LUCKY PONY WINNERS

NOTICE WE PRINT THE NAMES OF 30 OF OUR 157 LUCKY PONY WINNERS. We would gladly print the whole 157 names if we had room for them here, but we will send them to you just as soon as we hear from you. Possibly some of these happy children live in your county or a county near you and, if so, you probably know them because our Lucky Pony Winners are the best known children in their neighborhoods. However, it doesn't make any difference where you live; if you send us your name and are the lucky child to get "White Sox," he and his whole outfit will be shipped without one cent of cost to you. If you send us your name the day you read this, we will send you 1,000 votes for "White Sox" and also a big surprise that will double your chances of getting a Shetland Pony. We haven't room to explain it here, but we will tell you as soon as we hear from you. Remember, you can't get "White Sox" until you send us your name and become a member of the Pony Club, so sit down and write us at once. Don't miss this grand opportunity!

EVERY CLUB MEMBER GETS A PRIZE.

Every single child who sends us his name and joins our Pony Club will receive a handsome prize of his own choosing. Besides the Pony Outfit (and the Big Surprise we have for you), we will give bicycles, diamond rings, sewing machines, rifles, cameras, gold watches, flashlights and many other wonderful rewards that you never could get until now. Of course, "White Sox" and his dandy Outfit is the best prize of all and you have the same opportunity to get him as any other boy or girl if you send us your name now.

SEND YOUR NAME TODAY.

Our ponies are given away so quickly that you will be more sure of getting this one if you sit right down now and send us the coupon with your name and address or a letter (either way will be alright). The work we require you to do to be a full-fledged Pony Club Member, eligible to get "White Sox," is so easy that any child who could drive a pony can do it. We shall write you promptly just as soon as we hear from you.

Care and Treatment of Seed Potatoes.

By E. A. ROGERS,
Cumberland Co., Maine.

There is so much complaint of poor seed potatoes being sold thruout New Jersey, Pennsylvania, Delaware and Maryland, and no doubt the same holds true farther South, that one would wonder whether there are any real good seed potatoes grown. At an informal meeting held in the New Willard Hotel, Washington, D. C., on December 18th, this question of good seed was much discussed. This meeting was announced by Prof. Orton at the morning session of the hearing on the extension of the potato quarantine. He requested all those who were interested in the matter of good seed to attend. The talk drifted largely to the education of the northern seed grower as to ways and means whereby he could produce potatoes for seed that were true to name and free from all disease.

The writer agreed with all that was said but could not help thinking that the grower in the South, purchasing carefully grown seed, is in just as great need of education as to its proper preparation and handling as is the Northern grower in how to produce it.

FIVE HORSE-POWER TRACTOR AT WORK ON FARM OF E. P. GARRETSON, ADAMS CO., PA.

One man can take very poor seed, and by properly preparing it, get better results in the field than his neighbor, who with as fine seed as can be produced anywhere in the North, does not properly fit it for planting. A little carelessness, so slight that one would not even think to call it carelessness, will cut down the yield per acre from a good paying crop to a ruinous loss.

In the spring of 1913 the writer finished cutting the seed for one field about nine o'clock in the morning, having about thirty-four bushels to finish the field. These had been dusted with sulphur as fast as cut and spread upon the potato house floor, about six inches deep. When enough were cut to finish the field we begun sacking the cut seed, one bushel in a sack while the man got the team.

The first load, including fertilizer, was sent to the farther end of the field with the instructions, which had been given repeatedly before, to place both fertilizer and potatoes along the end of the field, where they would be worked across the field, and not on any account to put one bag of seed on top of another. The second load was sent out in the same manner while the writer oiled up the planter, which was started about ten o'clock. About five in the afternoon we had worked over to where the man had thrown one bag of seed on top of another, directly contrary to my specific instructions. I called his attention to it, telling him that there was great danger that the seed in the under bag had heated. The ground was moist and the day was warm, and while I could not determine that the seed had heated I felt such might be the case. As it was a case of using them or not finishing the field that night, I used them.

Now for results: It took just a bag of seed to a row and the row in which this sack of seed was planted did not show over 40 percent of a stand of plants. In the hurry of digging time I did not weigh the product of this row and those on each side of it, but I know the loss was not less than 125 bushels per acre. Had the whole field come as badly as this one row, I should have abandoned it altogether; but there was almost a perfect stand of plants over the whole field except this one row. I cite this case to show that the Northern grower is not always to blame and while he needs education, and needs it badly along the line of producing seed true to name and free from disease, those in the south who buy it are equally in need of education as to the preparation and care of it after it comes into their possession. The heating of seed after it is cut is so deadly to its germination that care must always be used or loss is sure to follow.

I doubt if there is one man in a dozen who can cut seed potatoes from one week to three ahead of the planter and keep them in condition that will give 90 percent of a stand of plants; from 60 to 75 percent will be nearer the actual result, even for the careful man. Again, seed taken out of a cold cellar, where the eyes have not begun to show signs of starting, is not fit to cut and plant. There can be almost as much loss by this method as by the seed heating.

Potatoes intended for seed should not be allowed to sprout in the cellar where they make long white sprouts, if possible to help it, yet I had rather take them when in this condition and cut and plant with all the loss of vitality which has taken place in growing these sprouts than to take them when so hard and cold that the eyes show no signs of life. In the first case, most of the seed pieces would make plants, but not as strong as would have been the case could the plants have come from the first sprouting. In the second case, cutting and planting these hard, cold tubers would be most sure to result in a large percentage of missing hills which might be as high as 50

PRIZE-WINNING POTATOES AT THE MAINE SEED IMPROVEMENT ASSOCIATION SHOW, 1913.
The center till shows sample prize winning Norcross. The till on right showing World's Wonder won second on late variety. Bushel basket on floor, to right, is Norcross. Bushel in center on floor is Snow. Balance of exhibit, World's Wonder, Shown by E. A. Rogers, Cumberland Co., Me.

percent. This is much more apt to take place in the North where potatoes keep very much later in this condition than they do in New Jersey or farther South.

In bringing seed potatoes from the North, they are more or less warmed up in transit and the germ of life in the eyes is becoming active. In my next article I will treat of the proper disinfecting and preparation of seed tubers and the separation of mixed Irish Cobblers, which cost the Southern growers an immense sum each year.

Note.—This is the first of a series of articles on care and treatment of seed potatoes by Mr. Rogers, who is a well-known authority on potato growing. —The Editor.

The Deere Farm Demonstration.---II.

By THE COUNTRY PARSON.

The purpose of the Deere Farm demonstration outlined in our previous article is very clearly stated in Chapter V of the "Story of the Soil." A worn-out farm, without the use of barnyard manure and the help of what my friend John calls "the most scientific fertilizer mixer ever invented" or a cow, and without the purchase of one pound of acid phosphate or ordinary mixed fertilizer is to be made "as productive as it ever was, even in its virgin state." When restored to productive fertility, this land is to cost not more than $50 per acre and is to regularly pay a reasonable interest on the capital invested.

This problem was complicated with peculiar difficulties. About 100 acres of the 500-acre farm had been cleared. This, however, did not mean that it was possible to divide the place into seven 60-acre fields, lay out the work, start the teams and apply the calcium, phosphate and kainit before putting in a crop. A large part of the fields had been permitted to grow in scrub pine and sassafras, for the poorer parts of the farm had been gradually abandoned and cultivation confined to those portions which were best able to produce a crop. The inevitable result was a number of scattered and extremely irregular plots of ground, which had to be cleaned and squared out before they could be tilled to advantage.

Labor was fairly cheap. Colored help could be had for 75 cents a day and board, or $1 to $1.25, if the men boarded themselves. Accustomed to chop and grub, these hands were fairly effective, altho they ordinarily used tools which were so dull and clumsy that a Michigan lumberjack would scorn to be seen with them. When it came to handling teams and modern machinery, they were lost. Driving a six-horse team hitched to a Conestoga wagon, army fashion, with one line, presents no difficulty to the average colored farm hand in Maryland, but this does not mean that he can handle four horses hitched abreast to a disk harrow, not to speak of handling a checkrow corn planter or a seed drill.

The manager of the Deere Farm had these and other aggravating difficulties to contend with. It was a case of keeping the teams going and doing the best you can. Nevertheless, plans were made for the laying out and squaring up of the farm into seven 60-acre fields, leaving some wood lots and permanent pasture land. One of the first moves was to get a stand of alfalfa in order to cut down the heavy feed bills for the necessary teams.

There are three fields on the main road which leads past the Deere Farm. The field nearest the house is No. 3. In the spring of 1911 it was planted to corn, without lime or phosphate, which should have been applied, had it been possible to do so. This field brought only 12½ bushels of corn to the acre, with a fair amount of fodder. In the spring of 1912 the ground was prepared with a disk harrow and sown to cowpeas. It was again impossible to apply either the ground limestone or the raw phosphate. The cowpeas did not do much. They were disked under in the fall of 1912 and the field sown to wheat, after two tons of raw rock phosphate and one-half ton of kainit to the acre had been applied. The wheat came up strong and green, wintered well and produced a fair yield of grain and straw. This wheat was used as a nurse crop for grass. A good stand was secured and at the time of my recent visit was being grazed by teams.

Field No. 1 adjoins field No. 3 on the southwest. It also fronts on the main road and has the same type of soil, a fairly heavy loam. Since it adjoins the timberland, it required more labor than No. 3. A considerable portion of it was cleared to square out the field. It was therefore also impossible to make any application of lime or floats. So far as it was cleared, it was plowed in the spring of 1911 and planted with corn. This portion of the field was sowed with cowpeas and soybeans in the spring of 1912, while the newly cleared portion was planted with corn. The corn was practically a failure, even on the recleared ground, and the soybeans, because of imperfect inoculation, did not make very good showing. Phosphate and kainit were applied in the spring of 1913, and the field again sowed to cowpeas and soybeans. There was a fair stand, altho the cowpeas looked rather yellow, which may be due to the phosphate or lack of lime.

A ROW OF MAPLES PROVIDES A WINDBREAK EVEN IN WINTER "FOLIAGE."

The other front field is of a different soil type, a Susquehanna gravel and Windsor sand rather than a Leonardtown loam. Last year it had a scattered stand of puny soybeans. It was planted with corn, which did not make much of a yield. A cover crop of cowpeas has been sown between the corn rows. So far as I can see, there has been no application of lime or phosphate. This field is interesting, because we here have the first attempt to use a cover crop on the Deere Farm, something which Dr. Hopkins might have done in 1911, instead of 1913, had he taken the advantages of our Maryland climate into account.

Field No. 5 lies to the east of field No. 3, back from the road. It is a beautiful piece of undulating loam. After being plowed in the spring of 1911, this field was sown to crimson clover and cowpeas, neither of which did much. The raw rock and kainit was applied in the spring of 1912, when the ground was prepared for corn. The response was prompt and the yield, while not large, was quite satisfactory. The promptness with which our Maryland soils respond to treatment and work is a constant source of astonishment to our German farmers, who come to Maryland from the West. They call it "a grateful soil." The results obtained by the Deere Farm demonstration would go to show that they are right.

The alfalfa field is the farthest field from the road. While it adjoins the Susquehanna gravel field, it has a heavier and more loamy soil. This, by the way, is another peculiarity of these southern Maryland farms: The presence on one forty-acre field of half a dozen different types of soil. That one formula for treatment should equally apply to all of them does not seem quite reasonable.

I first saw this field after it had been prepared for alfalfa by the application of 6 tons of ground limestone per acre, careful working and inoculation with soil procured from the Maryland Agricultural College. Wherever the inoculation had succeeded, the alfalfa was of a dark green color which is a guarantee of success. The stand however, was very uneven. I felt at the time that the spreading bacteria and the increasing effect of the heavy application of lime might perhaps save the situation. The outcome proved this opinion to be correct. This field now has a very satisfactory stand of alfalfa, altho the presence of sorrel and dewberry vines would indicate that the soil is still acid. If there is an acid subsoil, the stand will not hold, but the experience of one of our German farmers with alfalfa upon a Leonardtown loam would indicate that this apprehension is unfounded.

I am still mystified by Dr. Hopkins' manner of applying his three-ply formula. It is "raw ground limestone, raw phosphate and organic matter." Not one of the Deere Farm fields has received any lime excepting the alfalfa field. Am I justified in asking if this is done in order that the acidity of the soil may acidulate the raw phosphate? If this is the case, may I also ask, if instead of waiting three years before applying lime, and harvesting a crop, it might not perhaps be more economical to immediately apply the lime with acid phosphate, especially since lime is so essential to the growth of leguminous cover crops? Dr. Hopkins' formula makes no mention of kainit. It is applied with the phosphate because "in the absence of decaying organic matter, the potassium of the soil becomes available very slowly. The kainit furnishes both potassium and magnesium in soluble form and it also contains sulphur, sodium and chlorine." Since decaying organic matter, which makes the use of kainit unnecessary, may be procured by the use of lime, I am again unable to understand why no lime has yet been applied upon the fields of the Deere Farm.

Now, I believe that Dr. Hopkins, if given sufficient time, will make good his claims, but I am unable to see how his doing so will benefit the man with limited means who must make a living for himself and his family while improving his farm.

Here is the proposition. The 500-acre farm cost $5,000. The soil is certainly cheap enough. And $35 per acre is not too much to pay for lime, phosphate and kainit if the one application is not to be repeated for six or eight years. If we think of what farmers ordinarily pay for an annual application of commercial fertilizer, this is also cheap enough. But it means the spending of $3,500 upon 100 acres of a 500-acre farm, besides buying teams and implements, spending money on putting buildings and fences in repair, more money on clearing and squaring out irregular fields, still more money for feed for the teams and for the family living expenses, and then work and wait for three whole years before the farm is in shape to produce a halfway decent crop. Surely no man can go into such a proposition unless he is backed by some philanthropic capitalist. A cash outlay of $15,000 and three years work will give him only 100 acres of tillable soil to pay the interest charges of $900 plus taxes, before the farmer has one cent to show for his seed and labor.

Against this several things may be said. For instance, that it is not necessary that the farmer should buy so much land and come on a bare farm. Buying too much land, just because it is cheap, is a pitfall for most people who come to southern Maryland. Nor is it necessary to improve the entire farm at once. If the lime and phosphate are applied to a ten-acre field each year, the whole farm can be gradually improved. Besides, most of these people own their farms and have managed to make a living on them. If they can be shown the possibilities of their soil under proper treatment, they will have received a very real service.

This is undoubtedly true, and the neighborhood of the Deere Farm is beginning to show that the community is profiting by Dr. Hopkins' demonstra- this meagre encouragement. If a farm- tion. But we must not overestimate er can spend $350 a year to apply lime, phosphate and kainit upon a ten-acre field, it will take him ten years to cover one hundred acres. Before he has covered two-thirds of his farm, he must begin to make a second application. To this we must add the expense of growing and plowing under green fertilizer. At that rate it will take a man 20 years to restore to fertility the soil of a 100-acre farm.

After the second or third year there will be an increased yield of crops from the 10 or 20 acres first treated. This may be looked upon as clear profit and a part of it will be spent upon other fields. A stand of grass or alfalfa may also be secured. This will relieve our farmer from the necessity of buying feed for his team. If he can keep stock the manure, to a certain extent, will also relieve him of the necessity of buying kainit, the most expensive of the fertilizing materials. But the fact remains that the restoring of a worn-out farm to productive fertility is a very slow and a very expensive process, impossible of accomplishment without cheap money and long-time loans. This brings us to the much discussed question of rural savings and credits. Dr. Hopkins is demonstrating two things at the Deere Farm, the possibility of soil restoration and the need of an agricultural credit system.

With all my admiration for the splendid results achieved at the Deere Farm, I have not yet been able to persuade myself that this formula, "lime, phosphate, organic matter," is a sovereign specific for every soil illness. Unfortunately, the impression is somtimes conveyed that such is the case. The work of our Maryland Experimental Station and our Field Demonstration Service, together with the experience of Southern Maryland farmers with lime, cover crops and acid phosphate persuade me that it is quite legitimate to ask: Is there perhaps another and a cheaper way to get at this thing—a way leading to the same goal, which may be followed by the man of limited means who must think first of making a living and second of soil improvements? While I may not be able to put it into three words, I think there is such a way. Whether there is or not, one other fact remains: The most important ingredient in every recipe is the calm, dispassionate judgement of the man who prescribes it.

A GIANT LEGUME

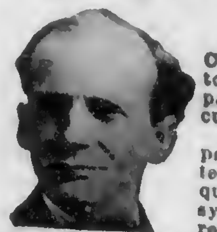
The accompanying illustration shows a large locust tree in the back yard at Woodbine Farm. The evidences of a dwelling are found on the spot where the little building stands, and this tree was planted by a pioneer, as locust is not a native to this section of country.

LARGE LOCUST TREE ON WOODBINE FARM, CRAWFORD CO., PA.

When planted, however, it makes a more rapid growth than any of our native trees. We have specimens here about twelve years old that are large enough for three fence posts. It does not suffer as much from insect enemies as in its native territory.

This giant legume is over eleven feet in circumference, three feet above the ground and while still in good state of preservation is beginning to show evidence of decline. It is our purpose to plant locust sprouts from time to time as wind-breaks. Their value as timber, their extremely rapid growth and the ease with which they can be started are factors in their favor. Aside from this the locust is a beautiful tree and its fragrant bloom in late spring adds to the glory of the farm. If any one has a larger locust tree, let us hear from you.—J. T. Campbell, Crawford Co., Pa.

Farm Counselor Department



By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Can a Poor Young Man Succeed?

The following query was asked the other day at a farmers' institute: "Can a young man with little money but with strength and good health begin farming and succeed as easily as his father and grandfather did?"

Yes, if he has another asset his father had, a good, efficient wife, and provided also they are willing to begin as their parents did, at the beginning. The trouble usually is that young people want to start in life under circumstances which their parents have been a life-time in attaining. Success must always be earned. You can't inherit it nor purchase it. The price is hard work, patience, self-denial—a price too many are not willing to pay. There are examples everywhere of the successful efforts of European emigrants in farming and home-making. They are not used to our comforts and luxuries when they come here, hence do not have to "come down" to it and are happy in their efforts; more than that, they are usually successful.

It is probably not possible for the inquirer to start on a first class, fully-equipped farm with modern buildings and furnishings and pay for it from the proceeds of the farm; at least it requires extraordinary ability. That kind of proposition represents the result of the efforts of a life-time. I have in mind the following concrete example which will illustrate a kind of success possible:

A young man and his wife bought a little run-down, dilapidated place of thirty acres, fifteen years ago. The buildings were in bad condition and the land was covered with weeds and bushes. The old rail fences were of no use. An orchard of forty trees had received no attention for years. They agreed to pay eight hundred dollars for it. Between them they had two hundred dollars which they used in "setting up." They were people with a vision. They planned, and dreamed maybe, but all the time their efforts were directed towards a given purpose—that of improving the land and developing a good home. The apple trees were pruned and the soil cultivated. The land was cleared of bushes and stone drains put in a five-acre field needing it. Apples, potatoes and poultry were their first products. Later cows were added, and now first-class butter sold at a high price adds to the income.

Space will not permit a full recital of their work, but now, after fifteen years, it is a model little farm. The buildings are in good repair. The house is supplied with running water and bath room. A lighting plant was installed last year and they plan to put a heating system in this year. They independently refused three thousand dollars for their farm last summer. This increase added to the value of personal property makes a satisfactory total in money value for their labor. But more than this, they have a home, free from debt—something that brings a feeling of satisfaction and security that is worth the long hours and hard struggle. It is this kind of effort and success that has always developed the strong sturdy characters of the country.

The secret of their success—if there is a secret—was seeing in the beginning the possibilities of the place, laying plans and then following those plans. They have had disappointments and failures, but these only add fuel to the flames of a passion to conquer difficulties. Necessities first, luxuries later, has always been the motto of the successful. We cannot reverse this order and succeed in any business.

The Soil's Twin Needs

It is encouraging to note among farmers the increasing recognition of what may be called the twin needs of eastern farms, lime and phosphoric acid. Both have been discussed in this department more than once, but several new queries have been received lately, especially about phosphoric acid. A summary answer follows:

On dairy and other stock farms the economical method of using phosphoric acid is to use acid phosphate freely in stables and on the manure pile, using about a quart per animal per week. This partially prevents fermentation and the escape of the ammonia, adds the element lacking in manure, and in summertime, tends to prevent the breeding of flies. Some are using the powdered, untreated rock known as floats for this purpose and claim good results. I think the majority of eastern farmers find the acid phosphate most effectual and economical.

Queries would indicate an increasing interest in the use of Thomas slag, or phosphate powder. This material carries about 17 percent. phosphoric acid and 32 percent. lime. This is a splendid material for wheat, grass and fruit trees and plants, used in connection with the other needed elements. It should be bought for about one dollar per unit, possibly a little more where long hauls are necessary. Do not figure too much on the value of the lime, as lime can be bought at a much cheaper price. Pure ground bone is a good carrier of phosphoric acid and ammonia, but is rather expensive for general crops except grass and fruit trees. It is a good thing with which to top-dress permanent pastures. Acidulated bone is scarcely ever an economical thing to buy.—R. P. K.

A PROFITABLE SECOND CROP

The same field that produced a "banner crop" of corn in 1912 yielded a "bumper crop" of rye the following summer. Immediately after the grain was cut, I removed it from that field and prepared the soil, plowing it deep, and sowed buckwheat in two acres. In October, I harvested the buckwheat and thrashed eighty bushels of seed. The labor was paid for when I gathered my honey, for the bees almost lived on the buckwheat blossom.

After the buckwheat was harvested and thrashed, I spread that straw on the two acres, gave it a top dressing of sheep manure and prepared the soil, which was then seeded in rye. The buckwheat experiment has proven to me that I can make my acres yield a double profit every year. I work my land in rotation, except that one field, which has been heavily fertilized for five years and that field always produces a banner crop of anything. Corn will follow rye and then I will rotate again. —A. L. Rout, Bucks Co., Pa.

ALL RIGHT, GO AHEAD

Your valuable paper seems to have fastened itself to me, "All right, go ahead." Kindly send me your proposition for local representatives.—A. W. Cooper, Hammonton, N. J.

A Cheap Roof
GALVANIZED
DICKELMAN EXTRA
THE DICKELMAN MFG CO
GUARANTEED 15 YEARS DEX
FOREST OHIO 1914
The Trade Mark of Quality Roofing
Exceptional quality makes "Dex" galvanized Metal the cheapest roofing made. The man who puts up Dickelman Extra Galvanized Roofing never takes it down. Its easy handling, high standard of quality and extremely long life makes it the cheapest roof known.
BEATS WOOD OR SLATE
lasts longer and looks better. Fire and Lightning Proof. You buy a life-time's satisfaction with "Dex" Roofing. Our 15 year guarantee stands for complete roof insurance.

THIS PONY FREE!

WE WILL GIVE YOU OR SOME
OTHER BOY OR GIRL THIS
PONY WITH COMPLETE OUTFIT

"WHITE SOX"

"WHITE SOX" is a beautiful [illegible] Shetland, almost solid black, with four white "stockings" and long silky mane and tail. He stands about 42 inches high and weighs around 300 pounds. We have already given away 157 ponies to boys and girls who joined our Pony Club and "White Sox" is just as fine as any of these other 157 beautiful ponies. This is saying a great deal when you consider that we go around to all the big pony farms and pick out the very best ponies we can get for children. "White Sox" is as gentle and lovable as any pet could be and is thoroughly broken to ride and drive. Hitched up in his nobby little pony cart, with his nickel trimmed harness flashing in the sunlight he makes the prettiest picture you ever saw. Not only is he pretty, but he can carry along a whole buggy load of happy children at a fast clip faster than many big horses can. "White Sox" and his elegant outfit, described in the opposite column, can be yours if you are willing to do us a favor. Send us your name today and we will tell you just how to get him. Don't delay, but do just as our 157 happy pony winners did and send us your name at once.

DO YOU WANT THIS OUTFIT?

THE OUTFIT

ALONG with "White Sox" we send the finest and most complete Pony Outfit that you ever saw. A stylish four wheeled pony buggy strong and easy riding, a handsome black, nickel trimmed harness and a hand made saddle and Indian horsehair riding bridle. No matter how rich a child's parents might be they could not buy him a better or more complete outfit than we send with "White Sox" to you or some other boy or girl. The horsehair bridle is made especially for us by an old cowboy at Deer Lodge, Montana, and is hand woven out of many-colored horsehair—red, black, yellow, green and white. It is woven into beautiful Indian designs, mounted with fluffy hair tassels, and the reins end in a real cowboy quirt. You will be the first to have one of these bridles in your neighborhood if you send us your name and get "White Sox" and his whole Outfit. We had just as soon send this wonderful Pony and Outfit to you as to any other boy or girl but you must send your name and address right away so we can tell you all about our easy plan. Use the coupon below, and mail it now.

SEND US YOUR NAME TODAY

IF YOU WANT TO OWN "WHITE SOX"

AS soon as we hear from you we will tell you how to go ahead and get "White Sox" for your own. We have a wonderful Pony Club that gives Shetland Ponies to its members and you can join this club without spending a cent of your own money and thus be eligible to get a pony free. Don't let anybody persuade you that you can't get this beautiful little pony and outfit because our plan of giving away ponies is different from others. The fact that we have already given away 157 ponies to boys and girls in 30 different states, from the state of Vermont to the state of California, several going over 1,800 miles from St. Paul, is proof that we give ponies away. The postmaster or banker in your town knows that the Webb Publishing Company of St. Paul, Minnesota, established for more than 30 years, is one of the largest publishing houses in the United States and can afford to give away ponies to advertise its papers. We never heard of one of the 157 members of our Pony Club to whom we have already given ponies until they wrote and told us they wanted a pony and that is why you must send us your name and address at once if you want us to send you "White Sox" and his dandy Outfit.

WE HAVE GIVEN AWAY 157 PONIES

HERE ARE THE NAMES OF A FEW OF OUR 157 LUCKY PONY WINNERS

"Bob," John R. Corn, Jr., Pulaski Co., **Arkansas.**
"Sweetheart," Lillias E. T. Howe, Nevada Co., **California.**

"Polly," Alfred Hokenstad, Dane Co., **Wisconsin.**

NOTICE WE PRINT THE NAMES OF 30 OF OUR 157 LUCKY PONY WINNERS. We would gladly print the whole 157 names if we had room for them here, but we will send them to you just as soon as we hear from you. Possibly some of these happy children live in your county or a county near you and, if so, you probably know them because our Lucky Pony Winners are the best known children in their neighborhoods. However, it doesn't make any difference where you live; if you send us your name and are the lucky child to get "White Sox," he and his whole outfit will be shipped without one cent of cost to you. If you send us your name the day you read this, we will send you 1,000 votes for "White Sox" and also a big surprise that will double your chances of getting a Shetland Pony. We haven't room to explain it here, but we will tell you as soon as we hear from you. Remember, you can't get "White Sox" until you send us your name and become a member of the Pony Club, so sit down and write us at once. Don't miss this grand opportunity!

EVERY CLUB MEMBER GETS A PRIZE.

Every single child who sends us his name and joins our Pony Club will receive a handsome prize of his own choosing. Besides the Pony Outfit (and the Big Surprise we have for you), we will give bicycles, diamond rings, sewing machines, rifles, cameras, gold watches, flashlights and many other wonderful rewards that you never could get until now. Of course, "White Sox" and his dandy Outfit is the best prize of all and you have the same opportunity to get him as any other boy or girl if you send us your name now.

SEND YOUR NAME TODAY.

Our ponies are given away so quickly that you will be more sure of getting this one if you sit right down now and send us the coupon with your name and address or a letter (either way will be alright). The work we require you to do to be a full-fledged Pony Club Member, eligible to get "White Sox," is so easy that any child who could drive a pony can do it. We shall write you promptly just as soon as we hear from you.

Care and Treatment of Seed Potatoes.

By E. A. ROGERS,
Cumberland Co., Maine.

There is so much complaint of poor seed potatoes being sold thruout New Jersey, Pennsylvania, Delaware and Maryland, and no doubt the same holds true farther South, that one would wonder whether there are any real good seed potatoes grown. At an informal meeting held in the New Willard Hotel, Washington, D. C., on December 18th, this question of good seed was much discussed. This meeting was announced by Prof. Orton at the morning session of the hearing on the extension of the potato quarantine. He requested all those who were interested in the matter of good seed to attend. The talk drifted largely to the education of the northern seed grower as to ways and means whereby he could produce potatoes for seed that were true to name and free from all disease.

The writer agreed with all that was said but could not help thinking that the grower in the South, purchasing carefully grown seed, is in just as great need of education as to its proper preparation and handling as is the Northern grower in how to produce it.

One man can take very poor seed, and by properly preparing it, get better results in the field than his neighbor, who with as fine seed as can be produced anywhere in the North, does not properly fit it for planting. A little carelessness, so slight that one would not even think to call it carelessness, will cut down the yield per acre from a good paying crop to a ruinous loss.

In the spring of 1913 the writer finished cutting the seed for one field about nine o'clock in the morning, having about thirty-four bushels to finish the field. These had been dusted with sulphur as fast as cut and spread upon the potato house floor, about six inches deep. When enough were cut to finish the field we begun sacking the cut seed, one bushel in a sack while the man got the team.

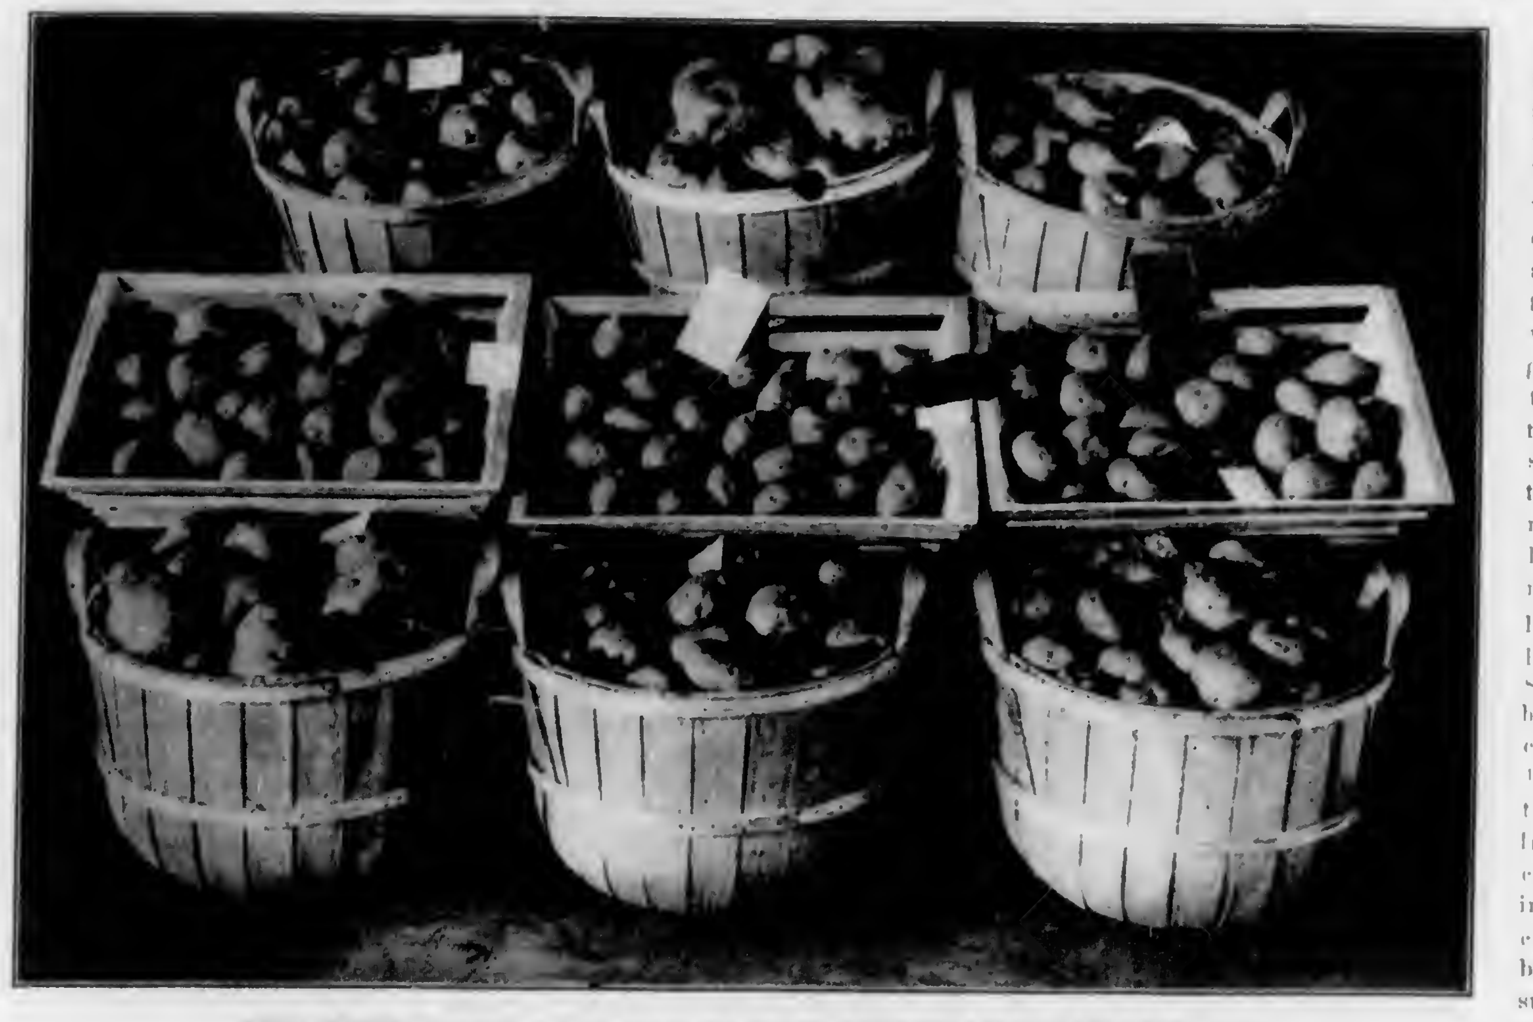
The first load, including fertilizer, was sent to the farther end of the field with the instructions, which had been given repeatedly before, to place both fertilizer and potatoes along the end of the field, where they would be worked across the field, and not on any account to put one bag of seed on top of another. The second load was sent out in the same manner while the writer oiled up the planter, which was started about ten o'clock. About five in the afternoon we had worked over to where the man had thrown one bag of seed on top of another, directly contrary to my specific instructions. I called his attention to it, telling him that there was great danger that the seed in the under bag had heated. The ground was moist and the day was warm, and while I could not determine that the seed had heated I felt such might be the case. As it was a case of using them or not finishing the field that night, I used them.

FIVE HORSE-POWER TRACTOR AT WORK ON FARM OF E. P. GARRETSON, ADAMS CO., PA.

Now for results: It took just a bag of seed to a row and the row in which this sack of seed was planted did not show over 40 percent of a stand of plants. In the hurry of digging time I did not weigh the product of this row and those on each side of it, but I know the loss was not less than 125 bushels per acre. Had the whole field come as badly as this one row, I should have abandoned it altogether; but there was almost a perfect stand of plants over the whole field except this one row. I cite this case to show that the Northern grower is not always to blame and while he needs education, and needs it badly along the line of producing seed true to name and free from disease, those in the south who buy it are equally in need of education as to the preparation and care of it after it comes into their possession. The heating of seed after it is cut is so deadly to its germination that care must always be used or loss is sure to follow.

I doubt if there is one man in a dozen who can cut seed potatoes from one week to three ahead of the planter and keep them in condition that will give 90 percent of a stand of plants; from 60 to 75 percent will be nearer the actual result, even for the careful man. Again, seed taken out of a cold cellar, where the eyes have not begun to show signs of starting, is not fit to cut and plant. There can be almost as much loss by this method as by the seed heating.

Potatoes intended for seed should not be allowed to sprout in the cellar where they make long white sprouts, if possible to help it, yet I had rather take them when in this condition and cut and plant with all the loss of vitality which has taken place in growing these sprouts than to take them when so hard and cold that the eyes show no signs of life. In the first case, most of the seed pieces would make plants, but not as strong as would have been the case could the plants have come from the first sprouting. In the second case, cutting and planting these hard, cold tubers would be most sure to result in a large percentage of missing hills which might be as high as 50



PRIZE-WINNING POTATOES AT THE MAINE SEED IMPROVEMENT ASSOCIATION SHOW, 1913.
The center till shows sample prize winning Norcross. The till on right showing World's Wonder won second on late variety. Bushel basket on floor, to right, is Norcross. Bushel in center on floor is Snow. Balance of exhibit, World's Wonder, Shown by E. A. Rogers, Cumberland Co., Me.

percent. This is much more apt to take place in the North where potatoes keep very much later in this condition than they do in New Jersey or farther South.

In bringing seed potatoes from the North, they are more or less warmed up in transit and the germ of life in the eyes is becoming active. In my next article I will treat of the proper disinfecting and preparation of seed tubers and the separation of mixed Irish Cobblers, which cost the Southern growers an immense sum each year.

Note.—This is the first of a series of articles on care and treatment of seed potatoes by Mr. Rogers, who is a well-known authority on potato growing. —The Editor.

The Deere Farm Demonstration.---II.

By THE COUNTRY PARSON.

The purpose of the Deere Farm demonstration outlined in our previous article is very clearly stated in Chapter V of the "Story of the Soil." A worn-out farm, without the use of barnyard manure and the help of what my friend John calls "the most scientific fertilizer mixer ever invented" or a cow, and without the purchase of one pound of acid phosphate or ordinary mixed fertilizer is to be made "as productive as it ever was, even in its virgin state." When restored to productive fertility, this land is to cost not more than $50 per acre and is to regularly pay a reasonable interest on the capital invested.

This problem was complicated with peculiar difficulties. About 100 acres of the 500-acre farm had been cleared. This, however, did not mean that it was possible to divide the place into seven 60-acre fields, lay out the work, start the teams and apply the calcium, phosphate and kainit before putting in a crop. A large part of the fields had been permitted to grow in scrub pine and sassafras, for the poorer parts of the farm had been gradually abandoned and cultivation confined to those portions which were best able to produce a crop. The inevitable result was a number of scattered and extremely irregular plots of ground, which had to be cleaned and squared out before they could be tilled to advantage.

Labor was fairly cheap. Colored help could be had for 75 cents a day and board, or $1 to $1.25, if the men boarded themselves. Accustomed to chop and grub, these hands were fairly effective, altho they ordinarily used tools which were so dull and clumsy that a Michigan lumberjack would scorn to be seen with them. When it came to handling teams and modern machinery, they were lost. Driving a six-horse team hitched to a Conestoga wagon, army fashion, with one line, presents no difficulty to the average colored farm hand in Maryland, but this does not mean that he can handle four horses hitched abreast to a disk harrow, not to speak of handling a checkrow corn planter or a seed drill.

The manager of the Deere Farm had these and other aggravating difficulties to contend with. It was a case of keeping the teams going and doing the best you can. Nevertheless, plans were made for the laying out and squaring up of the farm into seven 60-acre fields, leaving some wood lots and permanent pasture land. One of the first moves was to get a stand of alfalfa in order to cut down the heavy feed bills for the necessary teams.

There are three fields on the main road which leads past the Deere Farm. The field nearest the house is No. 3. In the spring of 1911 it was planted to corn, without lime or phosphate, which should have been applied, had it been possible to do so. This field brought only 12½ bushels of corn to the acre, with a fair amount of fodder. In the spring of 1912 the ground was prepared with a disk harrow and sown to cowpeas. It was again impossible to apply either the ground limestone or the raw phosphate. The cowpeas did not do much. They were disked under in the fall of 1912 and the field sown to wheat, after two tons of raw rock phosphate and one-half ton of kainit to the acre had been applied. The wheat came up strong and green, wintered well and produced a fair yield of grain and straw. This wheat was used as a nurse crop for grass. A good stand was secured and at the time of my recent visit was being grazed by teams.

Field No. 1 adjoins field No. 3 on the southwest. It also fronts on the main road and has the same type of soil, a fairly heavy loam. Since it adjoins the timberland, it required more labor than No. 3. A considerable portion of it was cleared to square out the field. It was therefore also impossible to make any application of lime or floats. So far as it was cleared, it was plowed in the spring of 1911 and planted with corn. This portion of the field was sowed with cowpeas and soybeans in the spring of 1912, while the newly cleared portion was planted with corn. The corn was practically a failure, even on the recleared ground, and the soybeans, because of imperfect inoculation, did not make very good showing. Phosphate and kainit were applied in the spring of 1913, and the field again sowed to cowpeas and soybeans. There was a fair stand, altho the cowpeas looked rather yellow, which may be due to the phosphate or lack of lime.

A ROW OF MAPLES PROVIDES A WINDBREAK EVEN IN WINTER "FOLIAGE."

The other front field is of a different soil type, a Susquehanna gravel and Windsor sand rather than a Leonardtown loam. Last year it had a scattered stand of puny soybeans. It was planted with corn, which did not make much of a yield. A cover crop of cowpeas has been sown between the corn rows. So far as I can see, there has been no application of lime or phosphate. This field is interesting, because we here have the first attempt to use a cover crop on the Deere Farm, something which Dr. Hopkins might have done in 1911, instead of 1913, had he taken the advantages of our Maryland climate into account.

Field No. 5 lies to the east of field No. 3, back from the road. It is a beautiful piece of undulating loam. After being plowed in the spring of 1911, this field was sown to crimson clover and cowpeas, neither of which did much. The raw rock and kainit was applied in the spring of 1912, when the ground was prepared for corn. The response was prompt and the yield, while not large, was quite satisfactory. The promptness with which our Maryland soils respond to treatment and work is a constant source of astonishment to our German farmers, who come to Maryland from the West. They call it "a grateful soil." The results obtained by the Deere Farm demonstration would go to show that they are right.

The alfalfa field is the farthest field from the road. While it adjoins the Susquehanna gravel field, it has a heavier and more loamy soil. This, by the way, is another peculiarity of these southern Maryland farms: The presence on one forty-acre field of half a dozen different types of soil. That one formula for treatment should equally apply to all of them does not seem quite reasonable.

I first saw this field after it had been prepared for alfalfa by the application of 6 tons of ground limestone per acre, careful working and inoculation with soil procured from the Maryland Agricultural College. Wherever the inoculation had succeeded, the alfalfa was of a dark green color which is a guarantee of success. The stand however, was very uneven. I felt at the time that the spreading bacteria and the increasing effect of the heavy application of lime might perhaps save the situation. The outcome proved this opinion to be correct. This field now has a very satisfactory stand of alfalfa, altho the presence of sorrel and dewberry vines would indicate that the soil is still acid. If there is an acid subsoil, the stand will not hold, but the experience of one of our German farmers with alfalfa upon a Leonardtown loam would indicate that this apprehension is unfounded.

I am still mystified by Dr. Hopkins' manner of applying his three-ply formula. It is "raw ground limestone, raw phosphate and organic matter." Not one of the Deere Farm fields has received any lime excepting the alfalfa field. Am I justified in asking if this is done in order that the acidity of the soil may acidulate the raw phosphate? If this is the case, may I also ask, if instead of waiting three years before applying lime, and harvesting a crop, it might not perhaps be more economical to immediately apply the lime with acid phosphate, especially since lime is so essential to the growth of leguminous cover crops? Dr. Hopkins' formula makes no mention of kainit. It is applied with the phosphate because "in the absence of decaying organic matter, the potassium of the soil becomes available very slowly. The kainit furnishes both potassium and magnesium in soluble form and it also contains sulphur, sodium and chlorine." Since decaying organic matter, which makes the use of kainit unnecessary, may be procured by the use of lime, I am again unable to understand why no lime has yet been applied upon the fields of the Deere Farm.

Now, I believe that Dr. Hopkins, if given sufficient time, will make good his claims, but I am unable to see how his doing so will benefit the man with limited means who must make a living for himself and his family while improving his farm.

Here is the proposition. The 500-acre farm cost $5,000. The soil is certainly cheap enough. And $35 per acre is not too much to pay for lime, phosphate and kainit if the one application is not to be repeated for six or eight years. If we think of what farmers ordinarily pay for an annual application of commercial fertilizer, this is also cheap enough. But it means the spending of $3,500 upon 100 acres of a 500-acre farm, besides buying teams and implements, spending money on putting buildings and fences in repair, more money on clearing and squaring out irregular fields, still more money for feed for the teams and for the family living expenses, and then work and wait for three whole years before the farm is in shape to produce a halfway decent crop. Surely no man can go into such a proposition unless he is backed by some philanthropic capitalist. A cash outlay of $15,000 and three years work will give him only 100 acres of tillable soil to pay the interest charges of $900 plus taxes, before the farmer has one cent to show for his seed and labor.

Against this several things may be said. For instance, that it is not necessary that the farmer should buy so much land and come on a bare farm. Buying too much land, just because it is cheap, is a pitfall for most people who come to southern Maryland. Nor is it necessary to improve the entire farm at once. If the lime and phosphate are applied to a ten-acre field each year, the whole farm can be gradually improved. Besides, most of these people own their farms and have managed to make a living on them. If they can be shown the possibilities of their soil under proper treatment, they will have received a very real service.

This is undoubtedly true, and the neighborhood of the Deere Farm is beginning to show that the community is profiting by Dr. Hopkins' demonstra- this meagre encouragement. If a farm- tion. But we must not overestimate er can spend $350 a year to apply lime, phosphate and kainit upon a ten-acre field, it will take him ten years to cover one hundred acres. Before he has covered two-thirds of his farm, he must begin to make a second application. To this we must add the expense of growing and plowing under green fertilizer. At that rate it will take a man 20 years to restore to fertility the soil of a 100-acre farm.

After the second or third year there will be an increased yield of crops from the 10 or 20 acres first treated. This may be looked upon as clear profit and a part of it will be spent upon other fields. A stand of grass or alfalfa may also be secured. This will relieve our farmer from the necessity of buying feed for his team. If he can keep stock the manure, to a certain extent, will also relieve him of the necessity of buying kainit, the most expensive of the fertilizing materials. But the fact remains that the restoring of a worn-out farm to productive fertility is a

very slow and a very expensive process, impossible of accomplishment without cheap money and long-time loans. This brings us to the much discussed question of rural savings and credits. Dr. Hopkins is demonstrating two things at the Deere Farm, the possibility of soil restoration and the need of an agricultural credit system.

With all my admiration for the splendid results achieved at the Deere Farm, I have not yet been able to persuade myself that this formula, "lime, phosphate, organic matter," is a sovereign specific for every soil illness. Unfortunately, the impression is somtimes conveyed that such is the case. The work of our Maryland Experimental Station and our Field Demonstration Service, together with the experience of Southern Maryland farmers with lime, cover crops and acid phosphate persuade me that it is quite legitimate to ask: Is there perhaps another and a cheaper way to get at this thing—a way leading to the same goal, which may be followed by the man of limited means who must think first of making a living and second of soil improvements? While I may not be able to put it into three words, I think there is such a way. Whether there is or not, one other fact remains: The most important ingredient in every recipe is the calm, dispassionate judgement of the man who prescribes it.

A GIANT LEGUME

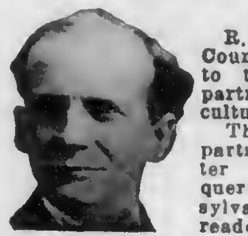
The accompanying illustration shows a large locust tree in the back yard at Woodbine Farm. The evidences of a dwelling are found on the spot where the little building stands, and this tree was planted by a pioneer, as locust is not a native to this section of country.

LARGE LOCUST TREE ON WOODBINE FARM, CRAWFORD CO., PA.

When planted, however, it makes a more rapid growth than any of our native trees. We have specimens here about twelve years old that are large enough for three fence posts. It does not suffer as much from insect enemies as in its native territory.

This giant legume is over eleven feet in circumference, three feet above the ground and while still in good state of preservation is beginning to show evidence of decline. It is our purpose to plant locust sprouts from time to time as wind-breaks. Their value as timber, their extremely rapid growth and the ease with which they can be started are factors in their favor. Aside from this the locust is a beautiful tree and its fragrant bloom in late spring adds to the glory of the farm. If any one has a larger locust tree, let us hear from you.—J. T. Campbell, Crawford Co., Pa.

Farm Counselor Department



By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Can a Poor Young Man Succeed?

The following query was asked the other day at a farmers' institute: "Can a young man with little money but with strength and good health begin farming and succeed as easily as his father and grandfather did?"

Yes, if he has another asset his father had, a good, efficient wife, and provided also they are willing to begin as their parents did, at the beginning. The trouble usually is that young people want to start in life under circumstances which their parents have been a life-time in attaining. Success must always be earned. You can't inherit it nor purchase it. The price is hard work, patience, self-denial—a price too many are not willing to pay. There are examples everywhere of the successful efforts of European emigrants in farming and home-making. They are not used to our comforts and luxuries when they come here, hence do not have to "come down" to it and are happy in their efforts; more than that, they are usually successful.

It is probably not possible for the inquirer to start on a first class, fully-equipped farm with modern buildings and furnishings and pay for it from the proceeds of the farm; at least it requires extraordinary ability. That kind of proposition represents the result of the efforts of a life-time. I have in mind the following concrete example which will illustrate a kind of success possible:

A young man and his wife bought a little run-down, dilapidated place of thirty acres, fifteen years ago. The buildings were in bad condition and the land was covered with weeds and bushes. The old rail fences were of no use. An orchard of forty trees had received no attention for years. They agreed to pay eight hundred dollars for it. Between them they had two hundred dollars which they used in "setting up." They were people with a vision. They planned, and dreamed maybe, but all the time their efforts were directed towards a given purpose—that of improving the land and developing a good home. The apple trees were pruned and the soil cultivated. The land was cleared of bushes and stone drains put in a five-acre field needing it. Apples, potatoes and poultry were their first products. Later cows were added, and now first-class butter sold at a high price adds to the income.

Space will not permit a full recital of their work, but now, after fifteen years, it is a model little farm. The buildings are in good repair. The house is supplied with running water and bath room. A lighting plant was installed last year and they plan to put a heating system in this year. They independently refused three thousand dollars for their farm last summer. This increase added to the value of personal property makes a satisfactory total in money value for their labor. But more than this, they have a home, free from debt—something that brings a feeling of satisfaction and security that is worth the long hours and hard struggle. It is this kind of effort and success that has always developed the strong sturdy characters of the country.

The secret of their success—if there is a secret—was seeing in the beginning the possibilities of the place, laying plans and then following those plans. They have had disappointments and failures, but these only add fuel to the flames of a passion to conquer difficulties. Necessities first, luxuries later, has always been the motto of the successful. We cannot reverse this order and succeed in any business.

The Soil's Twin Needs

It is encouraging to note among farmers the increasing recognition of what may be called the twin needs of eastern farms, lime and phosphoric acid. Both have been discussed in this department more than once, but several new queries have been received lately, especially about phosphoric acid. A summary answer follows:

On dairy and other stock farms the economical method of using phosphoric acid is to use acid phosphate freely in stables and on the manure pile, using about a quart per animal per week. This partially prevents fermentation and the escape of the ammonia, adds the element lacking in manure, and in summertime, tends to prevent the breeding of flies. Some are using the powdered, untreated rock known as floats for this purpose and claim good results. I think the majority of eastern farmers find the acid phosphate most effectual and economical.

Queries would indicate an increasing interest in the use of Thomas slag, or phosphate powder. This material carries about 17 percent. phosphoric acid and 32 percent. lime. This is a splendid material for wheat, grass and fruit trees and plants, used in connection with the other needed elements. It should be bought for about one dollar per unit, possibly a little more where long hauls are necessary. Do not figure too much on the value of the lime, as lime can be bought at a much cheaper price. Pure ground bone is a good carrier of phosphoric acid and ammonia, but is rather expensive for general crops except grass and fruit trees. It is a good thing with which to top-dress permanent pastures. Acidulated bone is scarcely ever an economical thing to buy.—R. P. K.

A PROFITABLE SECOND CROP

The same field that produced a "banner crop" of corn in 1912 yielded a "bumper crop" of rye the following summer. Immediately after the grain was cut, I removed it from that field and prepared the soil, plowing it deep, and sowed buckwheat in two acres. In October, I harvested the buckwheat and thrashed eighty bushels of seed. The labor was paid for when I gathered my honey, for the bees almost lived on the buckwheat blossom.

After the buckwheat was harvested and thrashed, I spread that straw on the two acres, gave it a top dressing of sheep manure and prepared the soil, which was then seeded in rye. The buckwheat experiment has proven to me that I can make my acres yield a double profit every year. I work my land in rotation, except that one field, which has been heavily fertilized for five years and that field always produces a banner crop of anything. Corn will follow rye and then I will rotate again. —A. L. Roat, Bucks Co., Pa.

HOW TO SPRAY

At the present time, fruit growing in the East is almost impossible unless spraying is resorted to. The grower must spray his trees in order to combat the rapid increase of their two great enemies, fungous diseases and insects, and thus compete with the product from the West, where conditions are more favorable.

The fungous diseases include mildew scab, blight, rust and rot. The great horde of insects may be placed in one of two classes: First, the chewing insects, which devour the whole leaf, stalk or fruit and second, the sucking insects, those which obtain the sap of the plant by piercing the outer covering with their tube-like mouth parts, such as the different scales, and plant lice.

Since the scales, etc., obtain their food from the inside of the plant they cannot be reached by contact insecticides, such as kerosene emulsion and lime-sulphur.

Let us treat the subject as it applies to the apple orchard in which it will be assumed there are old as well as young trees. On the old neglected trees the well known scale will probably be found. For this insect, I spray in the fall as soon as the most of the leaves have fallen. However, even if there are a few leaves on the tree, it is better to take advantage of a clear dry day. The bark must be dry, so that the mixture wil spread well over the entire tree, as it takes but few scales, if left, thoroly to infest the tree again. For this fall spray I use one of the miscible oils. Scalecide is the one I have used principally, 1 part scalecide to 12 parts of water with good satisfaction.

In the spring, I follow this with lime-sulphur before the leaves come. For the summer spray I rely on the Bordeaux mixture for a fungicide, with arsenate of lead added for the insects. This has been satisfactory except that we have experienced some trouble in the russeting of the fruit. Generally, I had warm quiet and pleasant days when I could spray over every side. I had no trouble then with the russeting; while the years of our greatest trouble from russeting have come when we had changeable catchy weather with wind often following showers. This led us to believe that the wind following spraying, especially if cold and raw, roughens the skin of the leaf and apple, much as a raw wind will roughen our hands if we get them wet, when out of doors. We know also, that if our hands are chapped, vinegar or salt or lime etc., will irritate the sore skin. Hence, I believe, that raw weather acts the same way with the apple trees, causing the russeting.

There seems to be considerable testimony to indicate that lime-sulphur may be the most desirable summer spray for peaches, but I am sure that many varieties of apples do not take kindly to it as a summer spray. For the young orchard, that has been well cared for from the start, I would advise the following: use fungicides as a summer spray only before the leaves have started, afterwards use only arsenate of lead as a summer spray. Our old orchards are too full of fungous for us to omit fungicides in the growing season. I first spray the summer mixture when some of the buds commence to show a shade of pink. The next spray follows when the petals have fallen off and the little apple is still upright so that we can force the spray into the blossom cavity but it must be given before the calyx tube closes. It is important that the blossom end of the fruit be well filled, for this is where the eggs are laid and we want the young insects first meal to be well flavored with poison. This spray is for the coddling moth thru which Maryland's experiment station claims 85 percent of her apples are destroyed every year.

If you spray too soon you will kill thousands of buds and very few moths; if too late, your time and material are practically thrown away, because the calyx has already closed. This spray is largely arsenate of lead because it dissolves readily, does not burn the foliage or apples when applied strongly and does not readily wash off in a shower. It is only when the fruits are so far matured as to make its use dangerous to the consumer that I first weaken the solution. Don't forget this spray is the most important one. The next spray is given two or three weeks later, followed by another about a month later. Another one can be applied August 1 to catch the late crop of coddling moth for desirable apples for exhibition purposes.

The person who depends upon printed directions to tell him just when and how and why to spray will not make a success of his spraying. Watch your bugs and be ready for business on short notice. If you know nothing about spraying machines and solutions write to some reliable firms that advertise in the farm papers and they will see that you are supplied. There is money for the fruit grower who sprays.—Geo. B. Summers, Montgomery Co., Pa.

ANNUAL CONVENTION OF STATE HORTICULTURAL ASSOCIATION

The 1914 annual convention of the Pennsylvania Horticultural Association will be held in the Court House, York, Pa., January 20, 21, 22. A large well-lighted room near the R. R. Station has been secured for the exhibition of fruit, corn, dairy products and farm supplies of all kinds. The Dairy Union, the Live Stock Breeders, the Plant Breeders and the National Berkshire Association will meet at the same time.

Fruit Show.—Prof. F. N. Fagan, State College, Pa., will again have charge of the fruit show, and fruit should be sent in his care, to the Colliseum, N. George St., York, Pa. Bring or send your best specimens. Send some boxes and barrels if you can and do your very best to interest your neighbors as well. There is no money to pay premiums but awards will be made on the basis of last year's premium list and ribbons will be given for first and second place.

Our association was cut off without any state appropriation this year. The situation is most critical. Will you stand by and see the association go to pieces or will you give your loyal support right now when it is needed. How can you help? In several ways; by paying your dues right now; by attending the meeting and entering enthusiastically into the discussions; by sending fruit to the show, even if it is only a plate or two; by getting as many new members as you can. Will you do it?—C. J. Tyson, Secretary.

ASPARAGUS CULTURE

Plants do not assimilate the plant food which is around their roots until all their parts are working, that is, until the foliage portion has developed sufficiently to act in conjunction with the roots. Some plants may appear to do so but they do not. They merely draw upon the food supplies stored in the root or its adjacent parts the previous season. This is the reason why our annual plants cannot survive the winter. They have no ability to store food upon which to draw in the spring. Our perennial plants are able to do this and many of them send up growth before conditions can supply them with any food outside of themselves.

The early growth of asparagus shoots is due to heat and moisture acting with the life force and food material within the crown and stimulating it to activity at the expense of its own resources. The application of manure previous to cutting quickens this growth, not from the nourishment it gives but because it warms up the bed. The actual nutriment of manures and fertilizers more conveniently applied before the growing season are not used to any great extent until the bed is plowed and the foliage tops begin their laboratory work in conjunction with the roots. Hence it will be seen that the early harvest of spears is an exhaustive process. Water and warmth are essential during the cutting season and all operations aim to give these to the bed of cutting asparagus.

The grower gets the early warmth of the sun to the crown by opening a shoal furrow down each row over the crowns. This aerates and warms up the earth, stimulates the early start of the tips and allows the drilling in of the fertilizer which the plants will use after the cutting season. The soil is then thrown loosely back and the bed left level until the spears show even with the surface of the ground. Then the beds are made up in ridges which insure the whiteness of the spears and prevent the cutting knives from injuring the crowns. After the beds are ridged up and cutting has begun, cultivation should be continued between the ridge regularly. This is where the inexperienced grower fails and his yield suffers. A loose mulch of soil between the rows means that much moisture which would otherwise escape is retained for the use of the roots. It is also necessary that the surface of the ridges be mellow and free from crust but the ridges help to keep this broken. Between the periods when the ridger is necessary, many growers find it helpful to run a Breed's Weeder over the surface of the ridges. It scratches up the crustiness and destroys young weeds without injury to the ridges or spears.

The cutting each day should be clean. Undesirable spears should be cut and cast aside and not left to draw on the roots and cumber the bed. A mature bed needs three months of growth in which to rest from two or two and one-half months of cutting. The next year's cutting yield depends upon the rest. Where a bed has been cut by April 15th, it will be noticed that about the last of May there is a new and vigorous increase in spears. These relays are from other sections of the root formed during the preceding summer by new extensions of the root stock. If these relays of growth are to give a profitable cutting yield, the growing period of summer and fall must be maintained in full luxuriance.—M. Robert Conover, Monmouth County, N. J.

Weeds.—The Minnesota Experiment Station at St. Paul, Minn., has issued a bulletin on weeds, No. 129. While this bulletin deals primarily with the weeds of Minnesota, with but few exceptions those weeds are common in this state. Descriptions of the various weeds are given, and detailed drawings of their seed. This is a valuable bulletin.

Eureka Send for Catalog—FREE

Potato Planter

Profitable for the large or small grower. Plants potatoes at lowest possible cost. *One* man operates it. Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if wanted)—covers up—marks the next row. Accurate, automatic and dependable. Sold with or without Fertilizer Attachment.

Here's why you should select the Eureka Potato Planter:—Furrow Opening Plow is directly under the axle—that means uniform depth at all times. The seed drops in sight of driver. Steel and malleable construction makes long life and few repairs. Made in three sizes—for one or two rows.

We also make the Eureka Mulcher and Seeder. Shipped from branch near you.

S L ALLEN & CO
Box 1202E Philadelphia

Planet Jr.

No. 28 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator, Rake and Plow

The newest and most accurate Planet Jr seeder. Sows all garden seeds in hills or drills, opens the furrow, covers, rolls down, and marks next row all at once. Has steel frame and handles, and complete set of attachments. Light enough for woman's use.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has a steel frame, and complete seeding and cultivating attachments. The hoes run close to row without danger to leaves or roots. Two acres a day can be worked with this tool.

Planet Jr 12-tooth Harrow, Cultivator and Pulverizer

An invaluable tool in the market-garden, truck and strawberry patches. Has new steel wheel which prevents clogging. Its 12 chisel-shaped teeth cut out all weeds, stir and mellow the soil and leave the ground in the finest condition without throwing dirt on plants.

No. 30 Planet Jr Single Wheel Hoe, Cultivator, Plow, Rake and Marker

A new Planet Jr Single Wheel Hoe that is light, strong and practically indestructible—the frame and handles are steel. It is completely equipped for plowing, hoeing, cultivating, and raking. The marking attachment insures rapid, economical wheel-hoeing.

No. 10 Planet Jr Horse Hoe, Cultivator, and Hiller

Does more and better work than any other horse-hoe ever invented. It is light and easily handled, yet unusually strong. Has new steel wheel which prevents clogging with trash. Quickly adjusted to rows up to 3½ feet apart. Vine-turner attachment is great for many crops at last workings.

The Dairy

WHY DAIRY FAILURES?

We are hearing much, and shudder very properly, over the waste of the government in navy expenses, but this amount is small as compared with the loss in feed material grown upon the farms, due to poor harvesting, inadequate protection, injudicious feeding, etc. Look at the amount of feed given to unprofitable animals, worth no more after eating $20 worth of food than before; of ill-bred horses, boarder cows and three-year-old steers weighing 1,100 lbs. We are talking of great improvement in quality of dairy cows, but it is as important that the dairymen learn to raise purebred foods and secure them, know what foods they can best raise, and what is their best preparation for profitable consumption.

We can well afford to look into this matter of the summer feeding of cows, and have less concern about raising soiling crops to help out the pastures. We can give a great deal more thought about a summer silo and filling it the last days of September for the summer to come. It was a dear lesson the advocates of summer soiling had in our section in 1913. Soiling crops will not grow very much in a long drouth, and the pastures had to be pieced out with purchased grain at $26 per ton, making dairying a pretty even exchange of milk for grain.

A JERSEY FARMER READY FOR THE TRIP OF THIRTY MILES TO THE CITY.

There is a commercialism going on that must be largely curtailed, or ruin is already in sight for thousands of dairymen. Farming on high priced land, buying instead of raising one's own cows, raising inferior stock, buying so much grain and other foods for the dairy, allowing pastures to deteriorate until a 30-cow dairy needs a 200-acre farm, cutting down the grain and crop acreage of the farms, and having at last only one thing to sell, and that, raw milk, at another man's price, is not conducive to dairy prosperity.

This commercialism will lead to our finding out that a herd of cows cannot keep up the fertility of a farm, that fertility has to be reinforced in some way. Each year more pasturage is required to the cow. Pastures will have to be cleaned up. They must be topdressed with lime, and if they cannot be put in crop rotation, then recourse must be had to acid rock and a sprinkling of potash. It is the ten acres of pasture to the cow that makes cheap farm lands. This brings us back to the beginning. How shall we start to inaugurate these demanded things? With crops and suitable feed combinations that reduce the cost to the lowest point, or with the better dairy, and feed what we have to better cows, and "grow into grace and full stature?" It is a great all round question. There is no end of successful modern dairymen, but all about them there are features in dairying that are surprising.—Chas. Mathew Morgan.

DAIRY INSPECTION LEGISLATION

Mr. Ernest Kelly, of the U. S. Department of Agriculture, is one dairy expert in inspection work who does not try to throw all the blame for poor milk on the farmer. In a recent report, he states: "No matter what safe-guards may be thrown around the production of milk if it is carelessly dispensed in the city the good may be all undone. A frequent fault is to expend so much energy on country inspection that the equally important subject of city inspection is neglected. A number of cities still allow 'bulk' or 'loose' milk, and many of them lay no restraining hand upon the filthy practices which are common to the trade. Stringent regulations and frequent inspections are needed for this particular phase of the question."

Another matter of considerable importance is the care of the milk after it has passed from the retailer to the final consumer. Many mothers should be instructed to be just as careful in washing and sterilizing milk bottles and cooling the milk in the house as dealers are in preparing their milk for shipment.

The legislatures of nearly all of the 48 states will soon be in session, and because of all that has been said and done during the past year, these sessions will probably be productive of much milk legislation. I believe that the laws that are certain to be enacted should measure up to certain standards. In the first place, they should be uniform; second, they should be simple; third, they should be enforceable, and fourth, they should be both necessary and just. As to uniformity the more closely all the States follow the lead of the New York City Milk Commission, the better. As to the second requirement, they should be easily understood by farmer, dealer and consumer, and admit of no possible misinterpretation. They should contain nothing to interfere with the speedy administration of justice, should they be broken, wilfully or otherwise, and the proper officials should be clothed with all necessary authority. No law should be placed upon the statute books unless circumstances absolutely warrant it, and all laws should apply impartially to every one connected with the handling of the milk, from farmer to last retailer.—D. T. Hendrickson, Monmouth Co., N. J.

DAIRYMEN'S LEAGUE

At a meeting of the Directors of the Dairymen's League, held at Albany, N. Y., November 28th, a resolution was passed that the League's books be closed February 1st, 1914, for the sale of stock to new members, and that no stock be sold unless agreements are signed at the time of subscribing for stock. The secretary was directed to communicate this information to the local branches, urging the officers and members to exert every effort to strengthen and complete their work of local organization before February 1st, and forward all subscriptions for stock and agreements to the Secretary as early as possible in order that they may be recorded and tabulated so the directors may know if they will be in position to act under the agreements this spring contract time.

We now have 290 branches, over 152,000 cows for which stock has been subscribed and nearly 9,500 stockholders, but agreements have been forwarded for only 67,000 cows. We are aware that many agreements are signed and being held by the local branches and it is important that these be forwarded that directors may know as early as possible when the 75 percent is secured and which is necessary before the directors can act in making sale of the milk. The directors can move only as fast as the members will lead.—Albert Manning, Secretary.

PENNSYLVANIA DAIRY UNION

The Sixteenth Annual Meeting of the Pennsylvania Dairy Union will be held at York, Penna., January 20th to 22nd, inclusive. The meetings will be divided into three sections—The Milk Dealers holding forth on the 20th; The Milk Producers on the 21st and the Butter and Cheese Makers on the 22nd. A full program has been arranged, including many excellent speakers, as Ernest Kelly of the U. S. Department of Agriculture: J. E. Dodge, Manager of Hood Farm, Mass.; N. P. Hull, Sec. Nat. Dairy Union; L. B. Cook, of the Dept. of Agriculture, and many others.

In connection with the meetings, there will be a show, as the combined efforts of the Dairy Union, The State Horticultural Association and the Live Stock and Plant Breeders. All of these associations will hold meetings in York during the same dates, as will also the American Berkshire Congress.

A large exhibit of dairy products is also expected. Liberal trophies and prizes will be awarded for the best exhibits of butter both dairy and creamery, and also certified and market milk.

PENNSYLVANIA HOLSTEIN FRIESIAN MEETING

The annual meeting of the Pennsylvania Holstein Friesian Association will be held at York, Pa., Jan. 22-23, with headquarters at the Colonial Hotel. Election of officers and business meeting will be held Jan. 23. On the evening of Jan. 22, Mr. A. L. Brockway, of Syracuse, N. Y., will give an address on tuberculin testing. Other speakers will be present and a good program arranged. All Holstein breeders of the state should try to be present.—W. M. Benninger, Sec.

Tuberculosis of Hogs.—Circular 201 of the Bureau of Animal Industry, Department of Agriculture, Washington, D. C., contains much valuable information relative to tuberculosis in hogs. It has been found that the following causes of hog tuberculosis are the most common: Raw milk and slime from creameries, hand separated milk from tubercular cattle, feeding behind tubercular cattle, feeding tuberculosis carcasses of various animals including fowls, feeding slaughterhouse offal and feeding uncooked garbage.

Binder Twine

A DAIRY farmer who does not use a cream separator is losing up to $15 per cow per year. Complete your dairy equipment by the purchase of an International Harvester cream separator—Lily, Bluebell or Dairymaid. These separators skim closely—leaving barely a drop of cream in a gallon of milk—and they will do it for years.

These machines are furnished with pulleys for the use of power. Belted to a small I H C engine, you have the best outfit it is possible for you to buy. Note the low supply can on I H C separators, the height of the milk spout which allows a 10-gallon can to be used for the skim milk, the strong frame with open base which can be kept perfectly clean, and the dozen other features which make these I H C machines the best.

Your local dealer should have one of these machines on sale. If he has not, write us before you buy and we will tell you where you can see one; also send you an interesting book on separators.

International Special Molasses Feed
AN OPEN LETTER TO DAIRYMEN.

What is the cheapest feed you can buy this season? That is the question that is interesting every dairyman right now.

Corn promises to be cheap and oats are selling at very low prices. Ground corn and oats will make you a cheap feed as far as cost per ton is concerned.

If you could buy a feed for mixing with ground corn and oats that would cost you about the same as corn and oats and that would increase your milk production at least $30 per month on each twenty head of cows, you would increase your profits $360.00 a year if milking twenty cows per month. If milking forty cows you would increase your profits $720.00 per year.

Hundreds of dairymen are using International Special Molasses Feed mixed in equal parts by weight with corn and oats and are reporting to us that their cows have increased from one to three quarts per day in their milk production. International Special Molasses Feed is far superior to ordinary mill feeds as a milk producer and conditioner.

Just figure out what an increase of 1½ quarts per day on each cow means for YOU. It means 240 gallons more per month from a herd of twenty cows. It means twelve gallons more per month from each cow. In order to get this result all you need to do is feed one-half International Special Molasses Feed and one-half corn and oats in the place of straight corn and oats. The increased milk production thus obtained makes the International Special Molasses Feed worth at least $25.00 more per ton than ground corn and oats.

Latest State bulletins give the following reports on their analysis of International Special Molasses Feed: State of Pennsylvania, protein 14.69; fat 5.74. State of New Jersey, protein, 15.82; fat 5.02. State of New York, protein 15.19; fat 5.58. This compares with an average analysis of less than 10% protein for ground corn and oats.

For each ton of International Special Molasses Feed that you will buy and use along with ground corn and oats you will make an extra profit of $20.00 over and above all extra cost.

Ask your dealer for International Special Molasses Feed. If he don't keep it for sale, then send us your dealer's name and address—we will arrange with him to supply you.

The Watch Tower of Prosperity

Get ready to build a silo for 1914. We have a special EARLY BUYERS' Proposition which will be of interest. A new book by Benjamin Quod, "The Watch Tower of Prosperity," our new catalog and other literature will be mailed free upon request.
Write for them today. Address nearest office.

The INDIANA SILO is the Watch-tower that marks the advancing line of progress in agriculture. It stands like a beacon light to the farmers and points the way of safety to those whose course to independence is beset by crop failures and high price feed. The

INDIANA SILO

is the easiest silo to erect and keep in order. The mechanical features found only on the INDIANA SILO make it the best silo to be had. Dollar for dollar it gives the greatest services of all silos and if used according to our instructions it will last a lifetime. It increases production; it lessons labor and doubles profits. It is not an experiment. It is not sold on promises but on the strength of its own past performances.

More INDIANA SILOS are in use on American stock farms than of any other make.

The contents of an INDIANA SILO are never endangered as the INDIANA SILO never gives trouble while filled.

The INDIANA SILO is not affected by the settling or cracking of foundation; there is no danger of cracked or bursted walls. Wood is a non-conductor and no loss results through improper curing through lack of heat or absorption of the juices.

The present high price of feed stuff and of live stock makes it imperative that the farmers of America conserve the wealth which their acres produce.

Away With Churns!
Use the "Fayway"—Get More and Better Butter
Stop Old-Fashioned, Wasteful Churning!
$1.00 Brings It
This marvelous machine is NOT A CHURN—it's a BUTTER MAKER! Does the work in half the time of the best churn. Gets MORE butter and BETTER butter from the *same cream* than by any other known process. The greatest MONEY MAKER for farmers and dairymen ever introduced. Makes your butter *bring more per pound!*
Revolutionizes Butter Making!
Fayway Butter Separator
The "Fayway" System produces butter by an entirely different process—no "whipping" or "beating" with paddles or blades. *A stream of air blows the billions of butter globules to the top*—gets ALL the butter-fat!
Made in 3 Sizes
How It Works
Just pour in the cream, turn the crank a few minutes and—*presto!*—there's the *butter!* Actually *fun* to make butter with the "Fayway"—all drudgery *abolished!*
Amazing Results
"Fayway" butter has a beautiful waxy texture. Tastes better, keeps longer, brings 5c to 10c more per pound than ordinary "churned" butter, and you get more of it.
Our $1.00 Trial Offer
We don't ask you to take our word. We want you to SEE with your own EYES how the "Fayway" makes butter. Simply send $1.00 deposit to show you are really *interested* and we will ship this amazing machine for a free trial in your own home. If it doesn't do *exactly* what we claim, *back comes your dollar!*
Write for Free "Fayway" Book
and Prospectus of Course in Butter Making. Or better still, send the $1.00 deposit TODAY and get the machine itself. It is the greatest invention since the cream separator was brought out. Free Prospectus tells all about *Fayway Butter Clubs* and the Fayway Course. 1)

Poultry

CUSTOM HATCHING

The beginner in poultry hatching work will do well to start with a small machine in order to learn the details of such work.

After operating lamp machines of different sizes for a number of years we purchased last year an 1800-egg capacity mammoth machine. We hatched over 4,000 eggs last season, and could just as easily have handled 5,000 while we were at it. As we are particularly interested in S. C. Rhode Island Reds and have a big trade for chicks we do not attempt a large amount of custom hatching. Last year we handled therefore only a little over 1,600 eggs from outside sources charging 2 cents an egg, and we refused a number of orders which we were unable to handle.

Our incubator uses the hot water system with which we have had excellent results.

Many of our customers after having their eggs hatched divide them up to different hens. In our own experience we set four hens and divided the chicks they hatched to two of them, giving the other two hens 25 chicks each from the incubator hatch. Comparison gave the incubator chicks the advantage in number brought to maturity over those hatched by the hens themselves. One woman who got 100 incubator-hatched chicks from us gave them all to one hen, bringing 88 of the number to maturity.

Customers should be educated to present only eggs which are uniform in size. We have handled lots of eggs embracing all sizes, but find that the more even in size the eggs are, the better they hatch. Invariably we have observed that those who tender nice even-sized eggs get the best results in hatching. Four of our customers gave us last season 150 eggs each. Of two who presented eggs of varying sizes, one got 66 chicks and the other 89. The other two got 96 and 110 chicks, respectively. After we got to understand the machine we found it easy to hatch 75 or 80 per cent of fertile eggs.

With a little practice, perseverance and persistence one can readily make a success of custom hatching.—W. R. Burkholder, Lancaster Co., Pa.

CORRECTING FEATHER-EATING

There is no more disgusting habit into which poultry can get than that of feather-pulling. This is generally started in half grown chicks when overcrowded. Richard Woods, a prominent English authority, once said that the nauseating habit of eating feathers can scarcely be called a disease; but that it is a subject worthy of attention, since healthy stock never, or very rarely, at all events, pluck and eat each other's feathers. He claimed that overcrowding is the most potent contributing factor, and that overfeeding, as well as giving too much animal food, is calculated to engender this vicious habit.

During the molting season fowls throw off imperfectly formed feathers, and these lying about are picked up by the chickens, creating a morbid desire for the peculiar bloody matter of which feathers in the embryo state are composed. The presence of parasites is thought to promote and foster the bad habit. Other fowls, seeing the insects, pull out the feathers to consume the parasites, and in doing so acquire a taste for the equally succulent constituents of feathers. When once the blood and fatty matter of the feather of overfed fowls has been tasted, it is almost impossible to check the desire for more. Habitually idle birds are the most given to this unnatural and vicious habit, and other birds often acquire the practise from these. The attack is generally first made upon the male birds, and it is surprising to see how patiently they will stand and allow their consorts to pluck them bare.

Some years ago the poultry department of the New York Experimental Station made a number of tests in this particular with varying success. Vaseline or lard (sometimes one and sometimes the other) in which had been mixed powdered aloes was applied to the feathers near the spot which had been picked bare, and on the new feathers which appeared. The Station reports that after continuing this treatment for some time the habit apparently disappeared, so that the birds were enabled to grow a full coat of new feathers. No change of any consequence was made in the food, etc., and the suppression of the habit was probably due to the disagreeable taste of the aloes. The means taken to discourage the habit necessitated frequent handling of the fowls, and would not pay with ordinary stock.—Boyd Michael, Atlantic Co., N. J.

THE GUINEA FOWL

Guineas are not a popular bird on many farms, frequently because of their roving disposition, and sometimes because of their noise-making propensities. Their roving tendencies, however, may be attributed largely to their taste for bugs and worms, many of them of the kinds harmful to crops, and this redeeming feature should overcome other minor objectionable features.

The plump, young guinea is the equal if not the superior of the ruffled grouse as a table fowl. City people are learning this truth. Two pound size young guineas are quoted by the commission houses at 50 cents each.

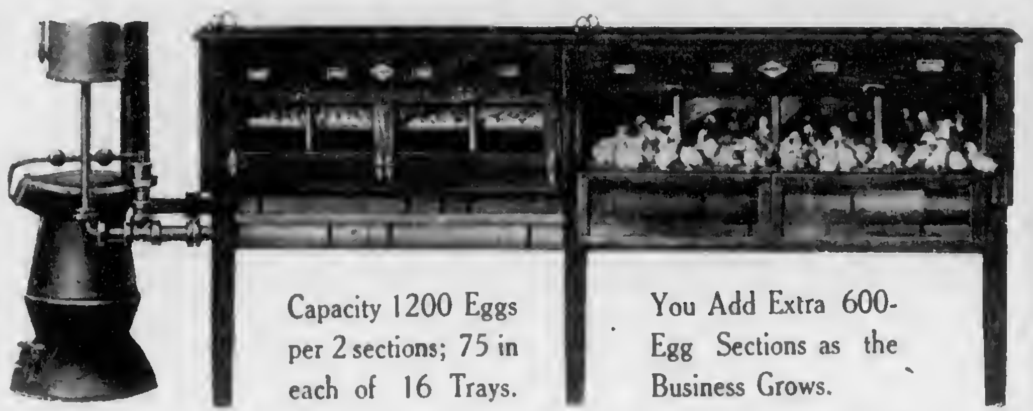
Aside from their value as insect destroyers and as a table fowl, guineas are excellent summer egg producers. Their eggs while not so large as those of the ordinary hen, have a better flavor and usually bring the same prices on the market. During the laying season from April to the middle of October one guinea fowl will usually produce from 75 to 100 eggs. During the summer of 1912 we received nearly $1.40 for the eggs from each hen. The average last summer was not so high ranging from $1.00 to $1.25 per hen.

It is not as expensive to feed a guinea hen as it is to feed the ordinary hen, inasmuch as they are smaller than chickens and much better rangers. They do not need any attention during the summer.—A. J. Legg, Albion, W. Va.

THE POULTRY HEAD LOUSE

The head louse attacks young chicks generally before they are feathered out, and is first found on the head with its claws or feeders sunk into the skin of the head. As they become more numerous, they attack the throat and neck as well. The remedy is simple, but it takes a little time. Each chick must have its head greased with lard, cottonseed oil or olive oil. You will have to look closely to see these insects. They are very destructive to chickens and must be controlled or exterminated if the chick is to be healthy.—A. C. Smith.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.



Capacity 1200 Eggs per 2 sections; 75 in each of 16 Trays.

You Add Extra 600-Egg Sections as the Business Grows.

$1056 Profit in 126 Days in a 6600-Egg Machine; $1584 in 189 Days

By Hatching Eggs for Other People And By Selling Baby Chicks

Add to that the extra profit in hatching stronger, sturdier chicks to sell or to raise yourself, and you will understand why some Poultry Raising Farmers make more money from Poultry than they do from their Fruits, Grain, Hay or Dairy

The Government reports show that poultry and eggs sell for more money than the wheat crop does. Every farmer cannot be a big grower of wheat but he can be a big producer of poultry and eggs and Baby Chicks with a

CANDEE INCUBATOR
Hot Water Sectional—Automatic

All that is needed is a clean cellar or basement. Each outfit comes in sections all built so that any handy man can set it up in a few hours. There is no danger from fire because the heater burns coal—safe as a kitchen range. Oil lamps are done away with. It takes five minutes to put coal on night and morning, at a cost of a few cents a day. Each 300-egg compartment is a separate machine with its own automatic thermostat regulator. Besides, there is an automatic regulator on the heater. This Uniform Hot Water Heat hatches stronger, sturdier chicks. It does not destroy oxygen as lamp heat does.

Any boy or girl or farmer's wife who has an hour or so a day can run the entire system. You can start with two sections and add extra sections as your business grows.

There are thousands of Candee Incubators, ranging from 1200-Egg capacity to 20,400-egg capacity, in use in this country. Nearly all of these systems hatch eggs for other people. There is room in every farming community for a custom hatchery. There is big demand for Baby Chicks.

If you are the one who is interested, write us. We will send you a book that tells you how to start a Custom Hatchery Business. Write today. You can start early with this outfit.

CANDEE INCUBATOR & BROODER CO., Dept. Z, EASTWOOD, N. Y.

Send for our Illustrated Booklet
Describing the Ideal Coal Stove Brooder with Automatic Regulator.
Heats poultry houses and broods large flocks. Superior to oil burners in safety, economy and amount of heat. It is made by a firm which has manufactured stoves for over 60 years. The adjustable hoover to the Ideal Coal Stove Brooder is regulated with pulleys and cords (note illustration). The height can be adjusted according to the temperature. Economy, plus effectiveness, is found in the Ideal Coal Stove Brooder.
Liberty Stove Co. 116 N. 2d St. Phila., Pa.

Feed, Care, and Management of Draft Horses for Market.

By H. J. SEULKE, Assistant Proffessor Animal Husbandry, Pa. State College

By draft horse we mean one weighing over 1,600 pounds, of a blocky, muscular conformation, having plenty of quality and able to pull a heavy load at the walk or trot on city streets and stand up under the hard strain.

The cause of the demand for horses of this character is the modern commercial condition. The congestion of streets in our large cities, the bulk and weight of freight and goods to be moved from place to place and rapidity of transportation demands a horse of sufficient weight and strength to move these heavy loads. Dr. Johnstone says that "if the draft horse should be suddenly extinguished the railroads would be, temporarily at least, forced out of business for lack of power to transport freight from warehouse or factory to the cars." The desire of mercantile firms to out-do each other in the perfection of their delivery horses and in the show ring has also helped toward perfecting the draft horse and making him the most salable horse on the market today, and at prices relatively higher than those brought by any other class of horses.

Characters demanded by the market are weight, size, action, style and quality. Color also plays a part in determining the price of an animal. While weights of drafters are usually considered to begin at 1,600 pounds, yet weights most favored by purchasers range from 1,800 upward. The heaviest geldings ever shown at the International have not reached the weight of 2,400 pound. However, it is claimed that more nearly perfect geldings have been shown than the best stallion yet shown. The greater the weight combined with more shapliness and quality, the higher the price a market will pay for a drafter. The higher priced drafters are always those carrying all the fat that can be put on them.

Age is an important factor in the marketing of the drafter, for the market demands a horse that is mature and has a full set of permanent teeth, and yet one that has the most useful part of his life still before him. As we all know, the horse should have a full set of permanent teeth by the end of his fourth year, and is practically matured at that time. The age most desired on the market is between five and nine years. Besides being of the correct age, the drafter should be properly broken. A horse with harness marks will bring more money on the market than a green, smooth looking youngster. He should be well broken to work double, and often preference is shown for a horse that is broken to work both single and double.

Training should also come before a horse is marketed. A draft horse is worked in the commotion of the down-town streets of the city, and unless he can behave himself he will cause considerable damage. Therefore, a horse should be trained to be unafraid of trains, cars, automobiles, and any and all of the strange sights and sounds that will confront him on the street. It is not always possible for the farmer to train his horse in this respect, but the better trained the horse the more money will he add to his owner's purse when he is sold.

In order to produce a high-priced drafter it is necessary to feed the colt intensively from the time he is born, for any set-back he may have may cause him to be stunted. It is impossible to produce a big drafter on a limited ration for the draft horse is an artificial and not a natural product; and because he has been produced by heavy feeding, any variation from the rule will fail to produce as large an animal. The colt should have plenty of exercise until he is two or three years old, when he should be broken and from then on until he is sold he should help produce the farm crops.

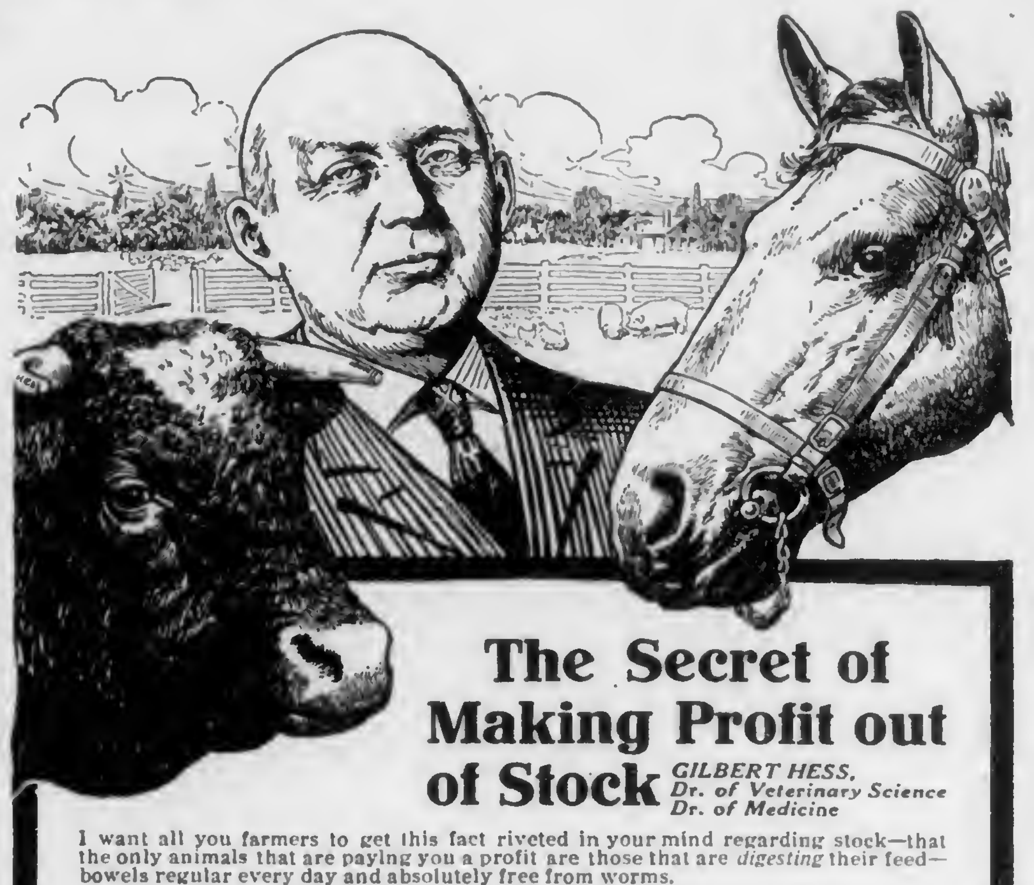
A few feeders manage their drafters as mules are generally handled; that is, turn 10 to 20 in one feed lot together. This is not a common practice, however, for horses are liable to injure each other when fed in this manner, and more economical gains are made when the horses are stabled. The more common practice is to tie the horses in stalls where they remain for all but the last week of the feeding period, when they are exercised a little each day to avoid any stockiness when they are put on the market.

The horses are usually bought, in a thin condition, in the fall, fed during the winter, being sold when prices are high in the spring. They are usually given a physic to clear their digestive tract, and their mouths are examined and floated if any sharp edges are found on the teeth. The feed boxes and pails are kept clean and the horses are kept well bedded. Little attention is paid to the grooming until the last ten days of the feeding period. The horses are fed grain morning, noon and night. The water is supplied twice a day and the hay is supplied in the middle of the morning and the middle of the afternoon. In order to insure good condition the horses are fed a little oil meal or from one-half to three-quarters of a pint of Glauber salts per head, twice a week. Many feeders give the horses blackstrap molasses during the last month of the feeding period, to give luster and softness to the coat.

The horses are gradually brought to a full feed, so as to prevent colic, and are fed entirely according to appetite, and, therefore, it is impossible or at least impracticable to give a ration by weight or measure. The following rations have given good results and represent a great enough variety of feeds so that any farmer can pick out a ration that suits his particular condition: (1) Corn, oats and mixed hay; (2) Corn, cottonseed meal and mixed hay; (3) Corn, cottonseed meal, corn silage and mixed hay. Clean clover or alfalfa hay will give faster gains than mixed hay in any of these rations, but owing to the fact that it is usually dusty, many feeders do not care to run the risk of loss by the use of clover or alfalfa.

The feeding period lasts from three to six months, according to the rapidity of the gains and the condition of the horses at the start. At the end of the feeding period the horses are carefully groomed, the feet trimmed, hoofs oiled, and the horses put in the best of shape for the sale.

With the above feeding and care, satisfactory gains are usually made, and owing to the fact that horses gain more rapidly and more cheaply when the value of a pound of gain is considered, many feeders are coming to the realization that they can make more by feeding horses than any other class of live stock, for it has been calculated that every additional pound on a drafter is worth twenty-five cents.



The Secret of Making Profit out of Stock GILBERT HESS, Dr. of Veterinary Science Dr. of Medicine

I want all you farmers to get this fact riveted in your mind regarding stock—that the only animals that are paying you a profit are those that are *digesting* their feed—bowels regular every day and absolutely free from worms.

And it is just at this very time of year when stock are not in that condition, because they are cooped up, deprived of exercise and for the last few months have been on dry feed, which does not contain the laxatives and tonics so abundantly supplied by grass.

Dr. Hess Stock Tonic
Aids Digestion Makes Stock Healthy Expels Worms

Being both a Doctor of Medicine and a Doctor of Veterinary Science I formulated Dr. Hess Stock Tonic to aid digestion, make stock healthy and expel worms.

This scientific, 21-year-old preparation contains highly concentrated tonics that improve the appetite and aid digestion, laxatives for regulating the bowels and vermifuges that expel the worms.

Remember, it's the cow in the pink of condition that fills the milk pail, the steer with an appetite that lays on fat, the horse that enjoys its dinner that pulls on the bit, the hog that is healthy and free from worms that gets to be a 200-pounder in six months.

Dr. Hess Stock Tonic will positively put your stock in these conditions. So sure am I that it will, that I have authorized your local dealer to supply you with enough for all your stock and if it does not do as I claim, return the empty packages and get your money back.

Dr. Hess Stock Tonic is never sold by peddlers—only by reliable dealers whom you know. I save you peddler's salary and wagon and team expenses, as these prices prove: 25-lb. pail $1.60; 100-lb. sack $5.00. Smaller packages as low as 50c, except in Canada, the far West and the South.

If not sold by your dealer, write direct to

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a
A splendid tonic that tones up the dormant egg organs and keeps the hens scratching and happy and laying all through the winter. Shortens moulting period and promotes rapid feather growth. Nothing better to make chicks strong and healthy. Cheap—a penny's worth is enough to feed 30 fowl per day. Sold only by dealers whom you know. Never sold by peddlers. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West. Guaranteed.

Dr. Hess Instant Louse Killer
Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c, 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

SWINE.

THIS O.I.C. SOW WEIGHED 932 LBS. AT 23 MONTHS OLD IONIA GIRL
I have started more breeders on the road to success than any man living. I have the largest and finest herd in the U. S. Every one an early developer, ready for the market at six months old. Philadelphia, Pa., January 17, 1914.

Farmers and the Currency Law. A number of the city papers in this state have shown considerable concern over the fact that the legislative committee of the Pennsylvania State Grange has directed a request to President Wilson that he appoint a practical farmer as a member of the Federal Reserve Board which is to administer the new banking law. An editorial in one of the leading Philadelphia papers characterizes the request as silly, and sarcastically remarks that "carpenters, ministers, lawyers, hod-carriers, electricians and telegraph operators" might as reasonably make a similar demand. Such efforts to ignore or belittle the just claims of agriculture in the formation and operations of the currency system of the country would not be worthy of consideration if they came only from an occasional newspaper editor. They are serious only because they seem to reflect the general attitude of the financial organizations, and even the law-makers having the currency legislation in charge, which has prevailed thru all of the discussion of this measure. Agriculture is the greatest wealth-producing industry of the nation. The combined value of farm property in this country exceeds that of any other industry. The prosperity and welfare of the farmers contribute more directly to the welfare of the country at large than any other single industry. The ability of the farmers to produce to optimum capacity affects not only every other industry of the country, but every individual in every city of the country thru the regulation of the costs of necessities. The government contributes directly to the welfare of every citizen whenever it takes steps to foster agricultural production. Yet the farms and the men operating them form practically the only class that is barred from doing credit business with the national banks. This condition existed under the old banking law, and it was not remedied in the bill recently passed. The government will advance money for the transportation of farm produce after it is produced and in the hands of crop traders and speculators, but it will not extend equal credit to the farmer to enable him to increase or cheapen his production. The government will take the commercial paper of the trader who may have a thousand bushels of wheat stored in a warehouse, but it will not take a mortgage on a farm whose value as security is a hundred times greater than the stored grain. It is because of this discrimination that the farmers are asking for a place on the governing board. In doing so, they are not asking for special privilege or class legislation but merely for just recognition and a square deal. The law-makers recognized the injustice of the provisions of the currency bill, but they were not willing to rectify it. Instead, they are now preparing to pass a rural credit bill or establish special banks for farmers. The Pennsylvania State Grange is to be commended for its enterprize and vigor in setting forth the just claims of the farmers. Had the National Grange shown the same measure of watchfulness and energy in representing agriculture before Congress when the present currency law was in the making, there might not be the present discrimination against the farmers or the need of a request for special representation on the governing board.

Country Roads On page 12 of this issue we publish a number of articles from farmers dealing with earth road improvement. We are receiving a great many communications of a similar character, all showing that there is tremendous interest among farmers in all parts of the state in improved roads. There never was a more favorable time for the State Highway Department to co-operate with local interest for good constructive road work. The rural districts are willing and anxious to do their part if they are given the right sort of support and are encouraged by an evidence of sincere effort on the part of the state authorities. There is an impression among the farmers that the present state road laws are a hindrance rather than a benefit to local road work. The state highway officials declare the present laws to be the best we have ever had. Good or bad, the laws cannot be changed until 1915. There is ample time for the State Highway Department to demonstrate not only its own efficiency, but also th efficiency of the existing laws and the regulations which have been put into force. The present temper of the farmers and road users indicates, however, that they will expect such a demonstration to be made during the present year, or there will be a general demand for a revision of the laws and a reconstruction in department plans. The plea of lack of funds cannot be urged as a legitimate excuse for inactivity. If there is not enough money to build roads under the system in force, the system must be changed. The amount of money available is more or less fixed. What the people want and what they have a right to expect is a system of state supervision which will turn the greatest possible proportion of the available money into actual road improvement. A machine that utilizes all of its power in keeping itself in operation is of mighty low utility value. Is the present state highway organization such a machine? Its work in the next twelve months should give the answer.

Potato Production A recent report issued by the Department of Commerce gives some interesting figures on potato production. It shows that the largest importation of potatoes in any single year occurred in 1912, when 13,750,000 bushels were imported. The next largest was in 1909, when 8,333,000 bushels were imported. The total quantity imported since 1900 is practically 37 million bushels, and the quantity exported in the same period is 16 million bushels. The average import price has ranged from 41 cents per bushel in 1902 to $1.09 in 1907 and $1.08 in 1911. The average price in the record year of 1912 was 52 cents per bushel, and in 1913, 93 cents per bushel. The average export price has ranged from 64 cents to $1.14 per bushel, while the average farm price has ranged from 43 cents in 1900 to 80 cents in 1911 and 69 cents in 1913. Importations came chiefly from England, Scotland and Ireland. Potatoes exported go chiefly to Cuba, Canada, Panama, Mexico and Columbia. Potato production is small in this country as compared with certain countries having a smaller area and a much less population. In 1911, the United States produced about 293 million bushels. In the same year Germany produced 1,263 million bushels; Austria, 426 millions; France, 424 millions; United Kingdom, 281 millions. The United States crop in 1913 supplied an average of 3½ bushels per capita, while that of 1912, the high record year in production gave an average of 4 1-3 bushels per capita. The domestic production in 1913, with 332 million bushels, was larger than in any other year except 1912, 1910, 1909 and 1904. The impression that last season's crop was seriously short is true only in comparison with these record years.

Better Seed Those who have made careful study of marketing systems and investigated the possibilities of direct marketing of farm products find one of the first reforms needed is in the matter of using better and more uniform farm seeds. Direct marketing, or any kind of co-operative marketing requires careful standardization of products; and there can be no standardization of products without standardization of seeds. The nurserymen and seed growers have long overlooked an opportunity to add to the value of their goods in this respect and they can add tremendously to the volume of their business as well as usefulness in advancing crop growing if they will put out seeds which can be absolutely guaranteed true to name and free from disease. The need of such seeds holds thru practically every class of vegetables, grains and fruits. It is strikingly illustrated in the difficulties potato growers have in securing seed true to name and of unmixed varieties. The progressive potato growers of Maine, who supply the bulk of the seed in this section recognize the need of improvement in this respect. As a result a "Potato Day" has been called, with public meetings to be held at Bangor, Me., January 27 and 28, for the purpose of discussing ways and means of improving seed potatoes as to purity, grading, storage, shipping, etc. In order to get the view of practical growers and meet the needs in growing sections, two representatives of the potato growers of New Jersey have been given places on the program and an invitation is extended to growers of all sections using Maine seed potatoes. The move is a most excellent one, and might well be followed by seed growers generally. Incidentally, the Bangor meeting should be well attended by potato farmers of this section and representatives of farmers' organizations using any considerable quantities of seed potatoes. It will be generally attended by Maine growers and it will give opportunity for a "get-together" meeting that should be of mutual advantage to both growers and seed men.

STATE CAPITAL NEWS

Butter, Cheese and Flour Census.—The new Bureau of Statistics of the Department of Agriculture, which is making a census of farms and farmers and their crops, is about to undertake some study of specialized industries in the farming communities of the State with a view to ascertaining the investments and the locations as well as to point out some opportunities. Studies are to be made of dairying with special relation to butter and cheese production. Butter production is general thruout the state with certain sections where there is more attention than others and an effort to get some reliable figures in regard to it will be made. The cheese industry is mostly in northern counties, but it is said to be larger than many suppose. The bureau is co-operating with the statistical bureau of the department of labor and industry in collating facts about the flour, grist and similar mills of the state. They will be listed and where they have been abandoned the water power situation will be noted. It is expected that the water power of these old mills will play a big part in the power of the future, especially for local electric plants. The engineers of the Water Supply Commission are also noting them in an independent inquiry.

Insurance Ratings.—People living in the country will be interested to a certain extent in the investigation being made into the practice of fire insurance companies by a legislative commission. The bulk of country properties are in mutual companies, which are not much concerned with schedules of rates in towns, but there may be some things which could be corrected. If people in this state are paying for losses sustained in Oregon and it is shown that risks are entitled to a lower rating it would not be a bad thing to know it. A good bit of writing and orating has been done about insurance rates and if the legislative committee will produce some facts it will serve the public to a considerable extent.

Dwindling Balances.—A good many people are of the opinion that the decline in the amount of ready money carried by state banking institutions as deposits of the general fund of the state is not as great a misfortune as some of the newspapers would have us believe. It is something of a jar to state pride of course not to be able to refer to the commonwealth as having ten or twelve millions of a balance on hand at any time and the state will, of course, lose the two percent interest but it will hardly cause the state government to suspend the payment of appropriations to schools, charities and other objects and we will not be hearing much about favored banks, etc. The best thing about dwindling of the general fund from $8,000,000 last May to something over $4,000,000 in January, is that it will bring legislators to their senses. The lawmakers have been carried away by belief that the state treasury was bursting with money and perhaps it was a good thing for Governor Tener to approve appropriations that will take up all of the available cash for then people will commence to see that if there is to be systematic appropriation for road building, increased allowances for the common schools, money for public works and other things which are for public benefit, there must be pruning of the list of so-called charitable institutions receiving state aid, and establishment of a policy of state aid for higher education. If the state is to continue its fine work at State College some of the other institutions will have to take less and probably give the state more in return. When it is considered that $16,855,391.31 was appropriated by the last legislature for charities alone, not including $2,625,000 for tuberculosis or $310,000 for new state institutions, some idea of the magnitude of these objects can be obtained. The whole state revenue for two years is but $65,000,000 and one fourth is voted for charity over which the State Board of Public Charities has a mighty limited control.

Horticultural Meeting.—Activities of the State department of agriculture, will be discussed at the meeting of the State Horticultural association at York, January 20. Reports will be presented to show the marked increase in orchards in the state and the danger in planting too many trees without experience in caring for them.

Over 400,000 Hunters.—According to estimates made by Dr. Joseph Kalbfus, secretary of the State Game Commission, more than 400,000 persons went hunting in Pennsylvania last year, about 325,000 being licensed hunters and the balance were farmers and land owners on their own land. The secretary says that this army of hunters bids fair to increase and that steps to secure further protection of game must be taken if any is to be left within a few years. He is also in favor of some regulation of the bounty law, which in his opinion, is not working out the way it should. Unfortunately, the income from the hunters' license which was expected to pay for the reimbursement of counties and for the work of the game commission is tied up over a question as to appropriation.

A Notable Program.—The program announced for the meeting of the State Board of Agriculture, as already indicated in this letter, will be one of the most unusual ever presented because every state official at the head of a department is to be represented. The relation of the various departments to agriculture, including taxation, health, schools and other objects is to be outlined. It is expected that many ideas regarding suggested legislation will be brought out.

Good Roads Plans.—The conference held here the latter part of the last week with the object of reaching a common plan for improvement of the roads of the State attracted little attention, but it bids fair to lead to something of prime importance to the rural sections. It remained for the organization known as the Good Roads Association to get together representatives of every organization interested in betterment of highways. The association was an advocate of the $50,000,000 bond issue but when that was beaten its officers were keen enough to realize that the people did not want it and set about to find the next best plan. There is a general belief at the Capital that the committee named will succeed in formulating a plan that will insure improvement of highways on a just basis, some regard for township as well as state highways and the commitment of the state to a definite appropriation program so that there will be no uncertainty as to funds. Questions of prison labor on roads and other details can be worked out. What is needed is a program.

Traction Engine Licenses.—State Highway department officials will be asked to go easy in enforcement of the cleat provision of the traction engine license by committees from various counties this month. The Lancaster county farmers have taken the lead and formed an organization which has drafted a statement setting forth how essential is the traction engine to the farmer and requesting that the subject be studied. It is expected that an attack on the law will be made as was done in Ohio.

More Orchards Listed.—State Zoologist Surface plans to add from 900 to 1,000 orchards to the list of those over which the state will exercise supervision. There are now about 1,000, of which 300 are demonstration orchards and the balance supervision, the latter being those over which the state inspector keeps an eye and which he can enter to show how trees should be cared for. Dr. Surface, because of increased appropriation for his work, will arrange for about 600 demonstration orchards and the rest in supervision classification.

New Township Road Bureau.—Coincident with demand of the legislative committee of the State Grange for the repeal of the township road law of the session of 1913, the State Highway department completed the organization of the Township road bureau, required by the act. Some months have been taken up in working out plans and it is now announced that the state will be ready to give aid, with plans and specifications as well as advice from engineers, to township authorities without cost.—Hamilton, Harrisburg, Jan. 12.

NEW YORK LETTER

Dairyman's League.—The annual meeting of the Dairyman's league was held in Albany on January 2. The following officers were elected: President, J. Y. Gerow, Washingtonville; Vice-president, F. H. Thompson, Holland Patent; Secretary, Albert Manning, Otisville; Treasurer, Louis M. Hardin, Sussex, N. J. It was announced that strenuous effort would be required to bring the pledges up to the required number before February 1, when the books close.

State Forestry Meeting.—The State Forestry Association will hold its second annual meeting in Albany on January 22. National and state experts will address the meeting, which will be devoted largely to the discussion of live questions, as a state wide forest fire law, land for forest preserves, opening of these preserves to proper uses, and the interesting of school children in forestry.

State Fair Commission.—Acting Lieutenant Governor Albert Wagner has been elected president of the Commission. Commissioner Huson was chosen vice president and A. E. Brown, secretary and treasurer. Assignment of the various commissioners to their duties at the next fair was made.

Holstein Men To Exhibit.—At a recent meeting of the Holstein Breeders' club of New York it was decided to make an exhibit for the first time at the National Dairy show in Chicago next fall. The National Holstein-Friesian association will meet in Chicago and the New York delegation will use a special train in making the trip. The place of meeting is the Sherman House and the time about the middle of June. E. A. Powell heads a committee to work up an interest in the meeting in this state. E. K. Munro of Camillus was elected treasurer in place of the late J. R. Hathaway. It was decided to incorporate the club.

State Grange Meeting.—The state grange will convene at Poughkeepsie on February 3 for a four days' session. On Tuesday evening there will be a public meeting under the auspices of the Dutchess County Pomona; on Wednesday the bi-ennial election of officers will take place. The sixth degree will be conferred on Thursday evening. Headquarters are at the Nelson House. The sessions will be held in the Columbus Institute. Howard E. Taylor is the man who looks after the assignment of rooms.

Orleans Fruit Growers.—The Orleans County Fruit Growers' Association has elected G. E. Snyder, of Gaines, president, Leslie Tanner, of Medina, vice-president, and Chas. G. Porter, of Albion, secretary and treasurer.

New Farm Bureau.—Ulster County Farm Bureau was organized recently at Kingston. Judge A. T. Clearwater is president. The Board of Supervisors has appropriated $1,000 for the Bureau on the condition that the Bureau raise $1,500 more.

The New Speaker.—Assemblyman Sweet, of Oswego, was elected speaker of the Assembly over Assemblyman Hinman, who was the stand-pat candidate. It seems now that Mr. Sweet may not be much more of a Progressive than is Mr. Hinman. Hinman has been chosen floor leader.—D.

COUNTY NOTES

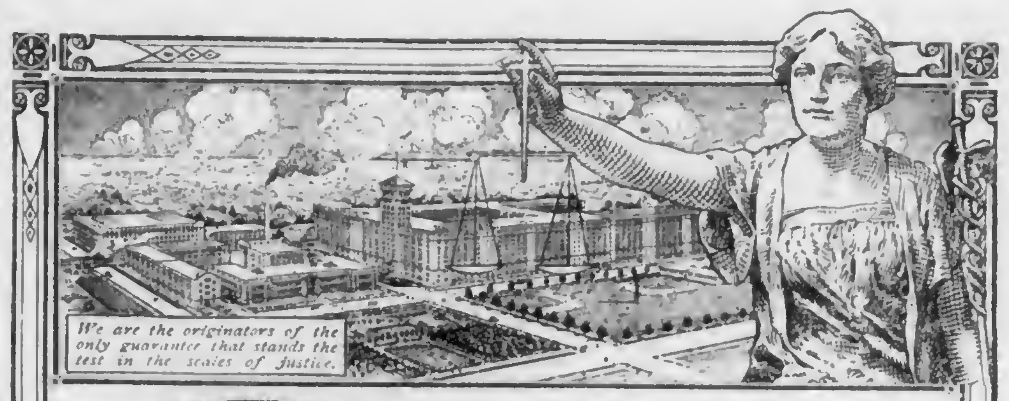
Warren Co., N. J., (N.W.) January 5. Have had very little snow. Storm is raging now. Hogs, 7½c lb. alive, 10c dressed. Calves, 10c lb; eggs, 36c doz; butter, 36c; corn ears, 80c per cwt; wheat, $1 bu. Threshing and cutting wood and most farmers do lots of milking in winter.—V. R. Loller.

York Co., Pa., (S.E.) January 6.—Weather quite changeable, not very much snow but a great deal of rain. Beef cattle still in demand, bringing 8@8½c per lb; wheat, 88c; corn, 71c; oats, 45c; potatoes, 75c bu; apples, 90c @$1.50 per bu; chicken 12c per lb; geese, 14c lb; butter, 33@38c lb; eggs, 30@32c doz. Considerable fall plowing is done. Most farmers busy stripping tobacco, hauling manure and doing repair work about machinery.—Clarence D. Emig.

Frederick Co., Md., (N.C.) January 5.—Very wet at present, rain for two days. Lowest temperature so far this winter about 20 above. No ice harvested yet. Very little snow up to date. Live stock in good condition; very scarce and high. Hogs scarce. Much meat spoiled by being butchered too early in the fall. Most of plowing done for corn. Very little left for spring. Farmers keeping manure hauled as fast as made. Eggs, 30c; butter, 30c; the latter very scarce. All milk and cream from this section shipped to Washington, D. C.—H. C. Fawley.

STATE BOARD OF AGRICULTURE MEETING

The 37 annual meeting of the Pennsylvania State Board of Agriculture will be held in the Caucus Room of the House of Representatives, Capitol Building, Harrisburg, Pa., Jan. 28 to 30. A valuable program has been arranged.



We are the originators of the only guarantee that stands the test in the scales of justice.

Solid Comfort Vehicles

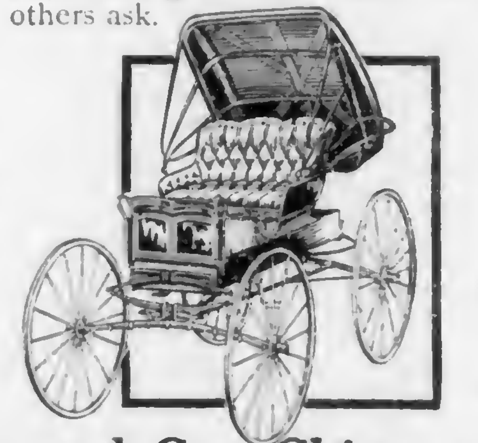
Our price for the splendid buggy illustrated below is **$61.90.** It has triple panel auto seat, genuine leather upholstering, highest type body construction, triple braced shafts, best wheels made, full wrought fifth wheel, real long distance self oiling axle. Shipped from a warehouse near you.

If you want to read the complete description of this and many other vehicle bargains, turn to the vehicle pages of our big General Catalog. Compare the quality and prices with others and remember the guarantee of satisfaction we give you.

If you haven't our big General Catalog, simply say "Vehicles—84P69" on a postal card and mail to

GREATER values than we have ever before been able to offer are shown this year in our complete line of Solid Comfort Vehicles as illustrated and described on the vehicle pages of our General Catalog.

Our *Leader*, illustrated below, is the biggest selling buggy ever manufactured. More than 50,000 are in daily use. But we offer equal values in other buggies, surreys, runabouts and spring wagons. Every vehicle we sell is guaranteed to give perfect satisfaction always. Our enormous vehicle business enables us to furnish the fullest measure of quality, style and workmanship, at prices a great deal lower than others ask.



Sears, Roebuck and Co., Chicago

Jacobson Gasoline–Kerosene Engines

No matter what work you want to do, there's a Jacobson engine that's just the thing. One of our newest operates on either gasoline or kerosene. Jacobson Portable Gasoline Engines are approved and labeled by the Underwriters. They carry the heaviest loads with ease. Material and workmanship finest obtainable.

Practical Potato Culture
is the name of a valuable Treatise on Potato Culture by **E. A. Rogers**, the well known potato authority from Cumberland Co., Maine.

The book contains much valuable information on selection of seed, planting, cultivation, harvesting and storing potatoes. Contains 126 pages printed on good quality of paper, handsomely illustrated by actual photographs of fields of potatoes showing different stages of growth.

This is a very valuable book and should be in the hands of every one interested in potato growing.

How to get it.—Send us 2 yearly subscriptions to Pennsylvania Farmer at 50 cents each, and the book will be mailed to you by return mail. Address
PENNSYLVANIA FARMER
214 South Twelfth Street,
Philadelphia, Pa.

FARMS FOR SALE.

Unimproved Farm Lands
WE OWN 30,000 acres of unimproved farm land in CLARK COUNTY, WISCONSIN. $18 an acre, small down payment, long time on balance, interest 6 per cent, good soil, fine climate, good water, land easily cleared. Close to R. R., schools, churches, cheese factories, creameries and Free Rural Delivery routes, telephone County and State Roads run through entire tract. Write for our booklet "Your great opportunity" Good agents wanted, commission guaranteed. LAKE STATES LAND COMPANY, 405-6 Commerce Building, St. Paul, Minn

PROFITABLE NEW JERSEY FARMS.
Potato, fruit, truck, stock, poultry, dairy and general crop farms. List free
A. W. DRESSER, - Burlington, New Jersey

Fertile Farms and unimproved lands in Delaware, diversified farming, live stock, delicious fruits and ideal homes. For information, address STATE BOARD OF AGRICULTURE, Dover, Delaware.

Country Road Needs.

RETURN ROADS TO THE LOCAL AUTHORITIES

An editorial in the Erie Dispatch stated that the “Farmer's vote” was largely instrumental in killing the fifty million bond amendment, and suggested that it was up to the farmers to suggest to the highway department a way out of its financial difficulties. Inasmuch as this is a serious question, suppose we act on the suggestion and offer a few words of advice:

Next to public schools, public roads have a greater influence on the welfare and progress of a community than any other factor. We all want good public roads at the first possible moment and at the lowest actual cost. A perusal of the report of the highway department does not indicate that either of these results are likely to be attained by present methods.

The position of the highway department in its relation to the roads of Pennsylvania is exactly parallel to that of the French nation in trying to build the Panama canal, viz.: Too far away from the base of operations. Too many high salaried officials to superintend, whose salaries total more than the cost of the work done. Entire lack of knowledge means everything to the economical construction of roads in Pennsylvania, the same as it did in constructing the Panama Canal; and the lack of this knowledge cost the French nation millions of treasure and flat failure at last.

The present investigations in the state of New York of graft in its highway department is disclosing exactly what may be expected in our own state —no reflections are intended—but the conditions are the same and they lead to the very same thing as sure as night follows the day. Every office or position on the highway department is appointive, leaving not one single opportunity for a choice of the taxpayer as to whom he would have expend his tax and superintend local roads.

You say “But we have local road supervisors, elected by the people.” Yes, we have, but the new act passed July 22, 1913, takes away every particle of authority they once had and requires them to send specifications for every bit of work contemplated to highway officials and get permission from the department to do it.

One of the supervisors at the recent convention even made a motion that it was the sense of that convention that the present act of assembly relating to roads made the road supervisors of the state look like “thirty cents.” And many of them declare they would resign from an office that allowed them no authority and yet held them to a certain amount of responsibility and made of them a bumper between the taxpayer and the highway department.

This kind of legislation is not going to stand simply because people will not submit to red tape, delay, and inefficient method of handling so important and vital a local matter as our public roads. Some method can surely be devised to put the control of local roads where it belongs.

A highway department can, perhaps, advise, instruct and superintend, in a general way, the sixty-seven counties of the state as units, but when it tries to superintend every mile of road and every little culvert in the state it will do exactly like the French nation, spend millions of money in salaries and traveling expenses, etc., and then throw up the job and let the farmers finish it—as was suggested at the convention: “Take up a collection and repair the Ridge road.”

Now taxpayers, why allow a method that in the few years it has been in operation has shown so conclusively that it is impractical, expensive ,and totally unequal to the task of maintaining our roads even in as good repair as before? We would like to know why a public road system could not be operated on the same general plan as that of the public school.

Elect a superintendent of public highways, establish a small bureau for the collection and disbursement of auto licenses and other state money to be appropriated for highway purposes; have compiled a “road code” similar to that of the “school code,” simply embodying general principals of bridge construction, grades, material, etc., etc., and let local road supervisors, like school directors, work out their own details to the best advantage under local conditions.

Vest authority to expend all state money in the present county commissioners who are conversant with all the local roads conditions and material and who would be personally interested in getting full value for every dollar expended and be directly responsible to the people for the wise use of this money. Let the people elect a county surveyor competent to do all necessary road work who can be reached when needed without four days' delay as was the case in Millcreek township the past year.

In other words, let everyone interested in good roads help to get back the authority taken away from us and delegated to a highway department, with 4,000 employes, so ponderous and expensive that there is no money left to really build and repair roads. A perusal of the articles written by Senator H. A. Clark shows very clearly why there is so little money for actual road work. It is nearly all expended for salaries and traveling expenses.

Judge Walling in his address to the road supervisors said, “whatever the people of a community or state want they can have. If you want good roads and go after them in the right way you can have them.” Well we want them, but the present method seems like a terribly slow and expensive way to get them. Let every automobile owner and road user set his wits to work and find a quicker and more economical way.—R. S. McCreary, Erie Co., Pa.

TO GET BETTER ROADS WHERE YOU LIVE

I have read with great interest the articles on the above subject appearing in Pennsylvania Farmer. Any one of those articles alone is worth one year's subscription to every farmer or other person who is obliged to travel much on the country roads. The first consideration and real foundation of all good roads is drainage. While the King Drag is indespensable, it is only an adjunct and comes in about second in the essential construction of a permanent dirt road. I have experimented on short sections of road and explained the system I used in an article published in this paper May 24, 1913.

Every foot of dirt road should have a perfect drain under the centre of road three feet deep and wide enough to lay two rows of three-inch tile side by side. The tile ditch should have sloping sides to about six feet wide at the surface and filled with crushed or cobble stone, rounded up with the dirt that had been removed from the ditch. This should be rolled down to a perfectly smooth surface and kept in shape by use of the King drag. You then have the best and cheapest road on earth and one that will last for ages.

In the series of articles now running, the estimate per mile is $30 for first year, $12 for the second year and $5 each subsequent year for up-keep. My estimate for building such a road would be $100 per mile for first year, and about $25 for each subsequent year, to be dragged as often as needed to keep in perfect condition. Such a road with up-to-date concrete tile drain, divided into sections with a man to keep in repair the year round, would be of inestimable value and last for ages. Most townships are equipped with good road machines with which all the ditching can be done excepting a little grading in the ditch with pick and shovel. Every township should own a stone crusher that would enable it to use any and all kinds of stone, but many miles could be built with cobble stone which farmers would be glad to furnish at a low figure to get them out of their fields.

The country earth roads comprise a large percentage of our road system and will for years to come. With the adoption of the proper system of building, dragging and carefully patrolling each section all the year, we can furnish the public with roads at 90 percent less than macadam road and more satisfactory to drive on ten months in the year. I know of short sections of underdrained road that have been in use over 30 years and while not always rounded up properly, have remained solid and free from mud practically the year round. With the careful use of a drag and the application of a little gravel, you can have a far superior road at one-tenth the cost of any macadam road I have ever seen. They are short-lived and soon become uneven and wear full of holes which cannot be successfully repaired. A brick paved road is better but without perfect drainage a good durable road cannot be constructed of any material.—W. R. McGill, Crawford Co., Pa.

“BETTER ROADS WHERE YOU LIVE” DEMONSTRATED

I want to say just a few words in commendation of Dr. McCaskey's articles on road work in Pennsylvania Farmer. The articles and illustrations have to do with roads which I have traveled every day, with few exceptions, for almost four years. The conditions as pictured in the first illustration were prevalent previous to, and the first year after I was appointed a regular rural carrier on Route 6 from Lancaster, Pa. After that the Doctor's efforts began to bring forth fruit and the roads are pretty generally as pictured in the second illustration.

This is only one road. There was one that was even worse than the one shown in the illustration. In early spring my horse had to wade in mud to his knees, and it was almost impossible to drag my light mail wagon thru it. Here Dr. McCaskey succeeded in getting a man to work who was and is “on the job” with his drag just at the right time, and it is even better than the dragged road illustrated, being the prize road of the township. I travel thru another township where they use the drag too, with admirable success. This beat is particularly hilly, and taking up with a suggestion I made several years ago, they have cut out the hills appreciably and at the same itme have quarried enough stone to “fill in” low places, making the roads 100 percent better. They are at work now taking out one which will yield almost enough stone to build a mile of good macadam and get enough “spalls” or small stone to fill in low places all along the beat.

Such work pays. In too many instances supervisors and road masters are on the job for “what there is in it,” and not for the good they can do. One failing I find in particular is that when a scraper is used to clear out the ditches, when a rock is in the way, instead of having men following to dig it out, the shear of the scraper is simply lifted and on they go. The first heavy storm that comes along eliminates all the work done. This wastes money uselessly. Ditches must be clear thru their whole length, and must be looked after and cleared out after every rain. Another bad habit is to scrape the road up nicely, leaving the clods in the center without dragging or pulverizing them. Consequently farmers and others drive along the sides and in a short time the dirt is back in the ditches and the road is a flat as ever.

Another suggestion: If every road user, during freezing weather and thawing weather, drive the center of the road when soft, they would have two nice smooth places to drive on when the ground was frozen hard, instead of bumping over ruts which are thoughtlessly made by people driving promiscuously, hunting good driving when the roads are soft. This should be a rule to observe just as carefully as that of turning to the right to pass a team coming toward you. In conclusion, I wish to state that the supervisors who opposed Dr. McCaskey's progressive methods are all in the discard, the last one being defeated in last fall's election, and we have great hopes in the present board carrying the work along up-to-date lines until the roads in the township are all prize roads.—John H. Swant, Lancaster Co., Pa.

McSPARRAN'S GRANGE NOTES

Special Banks For Farmers

The question for immediate consideration in Congress now is that of establishing agricultural banks. The supposition that it is necessary to have a particular kind of bank for farmers' use seems to have been taken as an undisputed fact, and Congress is apparently bending its thought to the proposition as to how this so-called essential form of bank is to be constructed.

Years ago, there was a cry raised for the government to loan money to the farmers at a small rate of interest. After a while that cry died and in these last years the nation is travailing for the uplift of the farmer. So far this travail has brought forth wind, but I fear that so determined are the labors that if the farmer continues to play the role of a passive onlooker, there will be brought forth a progeny of assinine proclivities and an absolute disinclination to work.

As a grange, we have for years been fighting to have the burden of “special interests” taken off the shoulders of the producers of this country. We have pointed out in our grange platforms that these special interests were largely the result of class legislation; and now we have the sop offered to us to take from the parent government some of these legislative benefits in the form of a special bank loaning money at a special rate of interest. There are two fundamental propositions that these “uplifters,” and congress as well, want to take knowledge of. The first is that the American farmer is not a peasant, and the second is that class legislation is class legislation if it favors the agricultural class as surely as if it favors the bankers or the manufacturers.

Men have gone to Europe and brought back their systems of dealing with the farmer, and have attempted to apply them here apparently forgetful of the fact that the farmer of Europe is a peasant. Note his condition for a moment. He is ground down by the iron heel of Fuedalism; browbeaten by the aristocracy of “the divine right of kings;” taxed to death by governments in the conduct of which he had practically no say; inured to his condition by centuries of ignorant and unremitting toil, until at last, steeped thru it all in the idea of parental government, he receives the meagre benefits doled out to him to prevent his extinction.

Not so the American farmer. Gleaned from the fields of Europe by the love of religious freedom, he established here, less than a century and a half ago, a government unequalled in known history. From the shores of the Atlantic, with axe and plow, he pushed back into the depths of an unknown continent. As the latent treasures of this new land were opened up, he developed here a miner, there a mechanic. Again with nervous haste he pushed westward, and his needs became more and more diversified. The railroad, the factory and the town sprung up with mushroom speed. But on he went, not even the broad fields of the prairies checking his westward march. The alkali prairies were passed and the mountain valleys were occupied, until at last, breaking thru the Sierras, he made his last grand charge into the fertile slopes of the Pacific Coast. Along with him he took the church and school.

'Tis true, that in his all-absorbing haste he did not give the careful attention to legislation that he should have given. The unscrupulous politician plundered his honest gain until today he is obliged to contend for the reclamation of his rights; but he is no peasant. In that monumental march of 3,000 miles across hostile and unbroken territory, he has maintained the highest ideals of government known to man, so that today if you want a concrete specimen of a splendid state government you go not to “Penns Woods” or the “Dutch Settlement” or “the Harbor of the Mayflower”—now the seat of manufacturing and the abode of hair-splitting judiciaries—but out to the farmer state of Oklahoma.

The farmer asks no special legislation and needs none. If he can not pay interest as any other business pays it, according to the risk, it is because there is something the matter with his business. And we farmers know there is something the matter. We have time and time again pointed out our difficulty concerning the tariff, concerning local taxation, concerning transportation and concerning public service in general. And in banking, also, we lack a square deal. The farmer has the best collateral in the world, and he should be given the best line of credit by the banks. That is simple business justice. An industrial business is promoted. They issue bonds. The bank takes those bonds and sells them and credits the business with the amount of bonds underwritten. But a young man buys a farm that has for 50 years produced splendid crops. He needs financial aid. He goes to the bank. They do not want his mortgage. They turn him down. He has the merchants and the railroads beaten a mile as a safe investment, and what is needed is that the banks should take these mortgages as security and issue bonds upon them, thus converting them into a liquid asset.

Under any strong system of currency, some supervision of the rates of interest charged should be provided, but that would refer to all classes of borrowers and not alone to the farmers. To sum the whole matter up, my belief is that our currency system needs at present four things in addition to what has been provided in the new currency law: First, guarantee of bank deposits. Second, regulation of interest rates to insure as far as possible uniformity and equality of opportunity. Third, the inauguration of a department in our present banking by which mortgages would be received by the bank at a rate of interest proportional to the hazard, just as is now done in the underwriting of other enterprises and the issuing of bonds by the bank against these mortgages which could be floated at a lower rate of interest and the difference would be profit for the bank. Fourth, giving to real estate as collateral a line of credit similar to that already granted to mercantile operations.

We farmers have a right to these things, together with all other classes of people who do business with banks. We do not ask for special privilege. We do demand a square deal.—John A. McSparran.

A FARMER'S GARDEN

Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS

will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $2.50 to $12. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

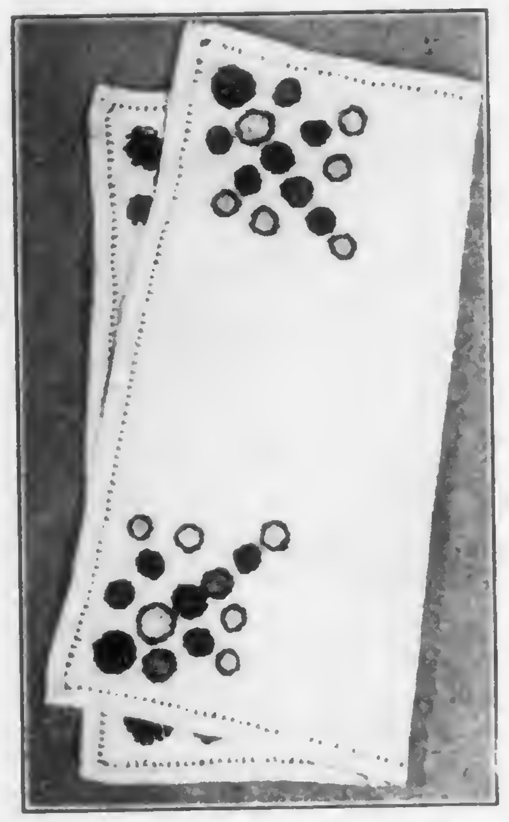
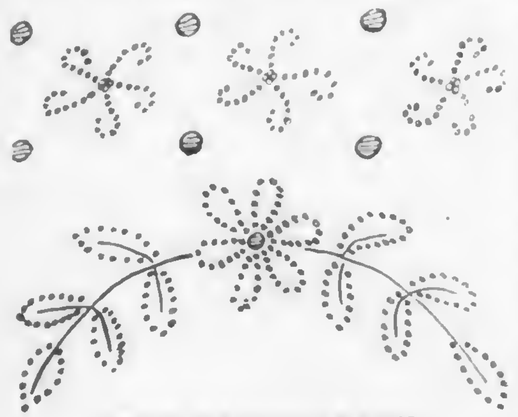
JEWEL AND BEAD EMBROIDERY

By Mae Y. Mahaffy.

Jewel work has long been a prominent feature in dress trimmings, and is utilized in combination with fancy stitches in various other forms of embroidery, but its usage now has become remarkable, owing largely to the popular craze for bead trimmings. The use of beads in embroidery designs almost invariably calls for some jewel work, and hence both forms are just now in the lead for trimmings. Since they are always splendid features, no matter what fad may be to the fore, it is well for every needleworker to understand just how to make the best of both beads and jewels in an ornamental way.



The jewel work is little more than a raised satin stitch. This solid work was found in many forms of embroidery, is, in fact, the foundation of most of the finest decorative needlework used today. The jewels may take the form of small vari-sized disks, as in the little doily shown, or that of ovals, hexagons, and other jewel-like shapes. Silk produces the best results, but now that so many attractive colors are obtainable in cotton floss it is quite possible to secure very good jewels by a discriminating selection of this cheaper material, altho the richness and brilliancy of the silk is certainly more appealing. The jewels may compose the entire design, or, as noted above, they may be intermingled with almost any other stitchwork to splendid advantage, whether on linen or some heavier fabric.



DESIGNS FOR SUITABLE BEADING.

A tray of gems in a jeweler's window will give one delightful ideas as to the possibilities in the color line. To be sure, it is not essential that a studied application of exactly copied colors should be aimed at; the same leniency is allowed in this field as in any of the other embroideries, but consideration of the real gems will suggest harmonious schemes of color which cannot fail to be appreciated. Sometimes the jewels are of such size that it is practicable to shade them a trifle, but as a rule they are best worked in one shade, the mingling of colors and tints being achieved by massing groups of the jewels, each in its own particular coloring. Then, too, pleasing results are often arrived at thru the use of the vari-colored or shaded floss altho this must be used with care, as any marked change from one shade to another while working a given jewel will produce startling results. Select about the same tone in all the different colors, daintier, more artistic effects thus being attained.

In the disks, work across in one direction in the satin stitch first to form the padding, and cross these stitches closely and smoothly for the outer embroidery. By beginning the outer work in the center and working out to the edges alternately it will be found very easy to preserve the contour of the circle, a very important item. In the ovals the padding may be placed lengthwise, with outer stitches straight across, or the padding may be slanted diagonally in one direction, and the outer layer of stitches be placed on exactly the opposite slant. This latter is perhaps the most effective method. The padding must always be made especially heavy near the center, so that the desired rounding figures will result. After the solid work is placed, fine outline stitches in black, rich brown, or in a shade darker than that of each jewel, are worked around each, the exact forms being carefully maintained

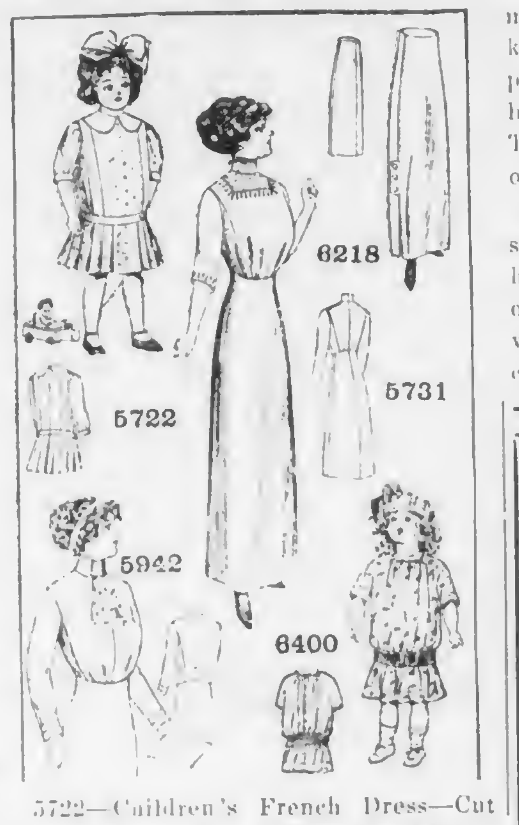
In doing bead embroidery fine needles and silk thread of the same shade as the material or of the beads will be needed. As to the background fabrics there seems to be no limit. Naturally, one would expect to see bead work on non-washable fabrics only, but washable gowns, waists, etc., are ornamented quite freely in the same fashion. However, silks, marquisettes, chiffons, voiles, challies, and similar materials will prove better adapted to the work. When washable goods are embellished in this way attention will need to be given the laundering process. No rubbing of the beads is allowable, and in ironing the article must be placed on a heavily padded surface, and as little weight placed upon them as is practicable to prevent breakage.

Two designs suitable for beading are shown, but almost any embroidery design may be beaded, particularly those for French knot or cross-stitch work. In the latter, each of the crosses is represented by a bead, while in the former the French knots are replaced by beads. As a rule, outlining or couching is combined with the bead work, and frequently some solid work. It is not wise to stamp the regular embroidery patterns on any material for bead work, as the beads will not cover all the stamped lines. The pattern may be basted underneath transparent fabrics and readily followed. On others use the design stamped on tissue paper basted over the material, working right thru both, and when the beading is completed tear the paper away.

The beads are sewn down to the goods with as short stitches as possible so that the thread will not show beyond the bead, the thread being carried along on the wrong side. The beads are placed quite close together when a small size is used, but larger ones may be spaced a bit. The centers of flowers are formed of groups of beads, of one larger bead or sequin, or of a jewel in satin stitch. They may be in many-hued, irridescent effects, or any color combination may be followed, if more than one color is desired.

PENNSYLVANIA FARMER PATTERNS.

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.



5722—Children's French Dress—Cut in sizes 2, 4, 6 and 8 years. Age 8 requires 3 yards of 36 inch material. Price of pattern, 10 cents.

5731—Ladies Dress-Three-Piece Skirt. —Cut in 6 sizes, 32 to 42 inches bust. Size 36 needs 4⅜ yards of 36 inch goods and ½ yard of 18-inch all-over. Price 10 cents.

6218—Ladies Skirt.—Cut in 5 sizes, 22 to 30 inches waist. Size 24 requires 4⅜ yards of 36-inch material. Price, 10 cents.

5942—Ladies Shirt-Waist.—Cut in 6 sizes, 32 to 42 inches bust measure. Size 36 requires 3⅜ yards of 27 inch goods. Price 10 cents.

6400—Doll's One Piece Dress.—Cut in 7 sizes, 14 to 26 inches long. Size 24 requires 1 yard of 36 inch material. 3⅛ yards of edging. Price, 10 cents.

Freshening Flowers.—To keep a bouquet fresh for a number of days, sprinkle lightly with fresh water, then put into a vessel containing soap suds. Take the bouquet out of the suds every morning and lay it sideways the stalks first into the water. Keep it there a minute and then take it out and sprinkle the flowers lightly with water. Replace it in the soapsuds and it will bloom as fresh as when first gathered. The soapsuds needs changing every other day.

A Raspberry Dessert.—Cut a small sweet cantaloupe in half—serve one half filled with vanilla ice cream, the other with red raspberries sprinkled with sugar. This makes a fitting last course to a good dinner or luncheon.

BIG REDUCTION
Handsome Fur Set EXACTLY LIKE CUT $5.85
Really, a Rare Bargain
Stylishly tailored and well made throughout. Will give splendid satisfaction and wear. Lustrous black Imported French Coney Fur—the best selected skins—and lined with very good quality satin. Scarf is attractively trimmed with two silk ornaments and tassels. Gorgeous Pillow Muff to match, made over warm feather foundation, with silk wrist cord attached. Some department stores in Philadelphia charge $8.98 to $10 for exactly the same value—same style. We mail the set to you, postpaid, upon receipt of $5.85. Ask for set 31N296 A. Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

SYNOPSIS OF PREVIOUS CHAPTERS.

Farmer Winston, having failed as a homesteader, desperate, accepts a proposal to simulate Lance Courthorne, an adventurer. Courthorne and his pals are thus able to carry thru some smuggling operations. In the clash with the police, Courthorne kills Trooper Shannon, leaving evidence pointing to Winston as the murderer. The scene shifts to Silverdale, founded by Colonel Barrington. The Colonel is worried over wheat operations and the coming advent of Lance Courthorne, cousin to Maud Barrington, niece and ward of Colonel Barrington, to claim his share of his father's estate. Maud Barrington is told of Courthorne's past misdeeds. Winston, meanwhile, has pushed on to Montana, being held and later released, for lack of evidence, by a government officer, who discloses the belief on the part of the police, that Winston is the murderer of Trooper Shannon. A letter for Courthorne is opened by Winston. Complying with instructions therein, he meets and confers with a lawyer respecting Courthorne's inherited acres at Silverdale, and following out his role as simulator of Courthorne, goes to Silverdale and is there received as graciously as could be expected. Some of his actions fail to tally with Courthorne's reputation. He wins the good will of Dane, one of the Colonel's advisers. The real Courthorne, who was supposed to have been drowned during the smuggling adventure, now reappears in Montana, inadvertently learns of his inheritance, and pieces together conclusive evidence that Winston has gone to Silverdale. Courthorne and Ailly Blake, whose life he has blighted, agree to ignore each other's identity. Winston and Maud Barrington, caught by a blizzard while driving to Silverdale, find shelter in a deserted shed over night, where he acts the part of a considerate gentleman. Maud Barrington promises Winston to sow her land in wheat the following spring. Under criticism from the Colonel, Winston begins planting operations. He is commended by Maud Barrington for successful efforts to break the gambling habits of Ferris, a young Englishman, a task undertaken at her request. Courthorne now appears and Winston contracts to advance him money, provided he absents himself immediately. During a fire which threatens the wheat fields Winston is injured. Suspicions point to Ferris as the incendiary. Questioned, he admits his guilt, and is dispatched from the settlement. Winston soon recuperates. Wheat having gone down in the quotations, he prepares to go to Winnipeg on business.

CHAPTER XVIII (concluded)

Winston was grateful to her, and still more to Miss Barrington, who came in just then, while he did not see the girl again before he departed with Alfreton on the morrow. When they had left Silverdale a league behind, the trail dipped steeply amid straggling birches to a bridge which spanned the creek in a hollow, and Winston glanced up at the winding ascent thoughtfully.

"It has struck me that going round by this place puts another six miles on to your journey to the railroad, and a double team could not pull a big load up," he said.

The lad nodded. "The creek is a condemned nuisance. We have either to load light when we are hauling grain in, and then pitch half the bags off at the bottom and come back for them—while you know one man can't put up many four-bushel bags—or keep a man and horses at the ravine until we're thru."

Winston laughed. "Now, I wonder whether you ever figured how much those little things put up the price of your wheat."

"This is the only practicable way down," said the lad. "You could scarcely climb up one side where the ravine's narrow abreast of Silverdale."

"Drive round. I want to see it," said Winston. "Call at Rushforth's for a spool of binder twine."

Half an hour later Alfreton pulled the wagon up amid the birches on the edge of the ravine, which just there sloped steep as a railway cutting, and not very much broader, to the creek. Winston gazed at it, and then handed the twine to the hired man.

"Take that with you, Charley, and get down," he said. "If you strip your boots off you can wade thru the creek."

"I don't know that I want to," said the man.

"Well," said Winston, "it would please me if you did, as well as cool your feet. Then you could climb up, and hold that twine down on the other side."

The man grinned, and, tho Alfreton remembered that he was not usually so tractable with him, proceeded to do Winston's bidding. When he came back there was a twinkle of comprehension in his eyes, and Winston, who cut off the length of twine, smiled at Alfreton.

"It is," he said dryly, "only a little idea of mine."

They drove on, and reaching Winnipeg next day, went straight to Graham, the wheat-broker's offices. He kept them waiting some time, and in the meanwhile men with intent faces passed hastily in and out thru the outer office. Some of them had telegrams or bundles of papers in their hands, and the eyes of all were eager. The corridor rang with footsteps, the murmur of voices seemed to vibrate thru the great building, while it seemed to Alfreton there was a suggestion of strain and expectancy in all he heard and saw. Winston, however, sat gravely still, tho the lad noticed that his eyes were keener than usual, for the muffled roar of the city, patter of messengers' feet, ceaseless tinkle of telephone call bells, and whir of the elevators, each packed with human freight, all stirred him. Hitherto he had grappled with nature, but now he was to test his judgment against the keenest wits of the cities, and stand or fall by it, in the struggle that was to be waged over the older nations' food.

At last, however, a clerk signed to them from a doorway, and they found Graham sitting before a littered table. A man sat opposite him with the telephone receiver in his hand.

"Sorry to keep you, but I've both hands full just now. Every man in this city is thinking wheat," he said. "Has he word from Chicago, Thomson?"

"Yes," said the clerk. "Bears lost hold this morning. General buying."

Just then the door swung open and a breathless man came in. "Guess I scured that clerk of yours who wanted to turn me off," he said. "Heard what Chicago's doing? Well, you've got to buy for me now. They're going to send her right up into the sky, and it's about time I got out before the bulls trample the life out of me."

"Quite sure you can't wait until tomorrow?" asked Graham.

The man shook his head. "No sir. When I've been selling all along the line! Send off right away, and tell your man on the market to cover every blame sale for me."

Graham signed to the clerk, and as the telephone bell tinkled a lad brought in a message. The broker opened it. "New York lost advance and recovered it twice in the first hour," he read. "At present 1 point or two better. Steady buying in Liverpool."

"That," said the other man, "is quite enough for me. Let me have the contracts as soon as they're ready."

He went out, and Graham turned to Winston. "There's half-a-dozen more of them outside," he said. "Do you buy or sell?"

Winston laughed. "I want to know what a wise man would do."

"Well," said Graham, "I can't tell you. The bulls rushed wheat up as I wired you, but the other folks got their claws in and worried it down again. Wheat's anywhere and nowhere all the time, and I'm advising nobody just now. No doubt you've formed your own opinion."

Winston nodded. "It's the last of the grapple, and the bears aren't quite beaten yet, but any time the next week or two the decisive turn will come. Then, if they haven't got out, there'll be very little left of them."

"You seem tolerably sure of the thing. Got plenty of confidence in the bulls?"

Winston smiled. "I fancy I know how Western wheat was sown this year better than any statistician of the ring, and it's not the bulls I'm counting on, but those millions of hungry folks in the old country. It's not New York or Chicago, but Liverpool the spark is coming from."

"Well," said Graham, "that's my notion, too, but I've no time for anybody who hasn't grist for me just now. Still, I'd be glad to come round and take you home to supper if you haven't the prejudice, which is not unknown at Silverdale, against eating with a man who makes his dollars on the market and didn't get them given to him."

Winston laughed, and held up a lean brown hand. "All I ever had until less than a year ago, I earned with that. I'll be ready for you."

He went out with Alfreton, and noticed the lad ate little at lunch. When the meal was over, he glanced at him with a smile through the cigar smoke.

"I think it would do you good to take me into your confidence," he said.

"Well," said Alfreton, "it would be a relief to talk and I feel I could trust you. Still, it's only fair to tell you I didn't at the beginning. I was an opinionated ass, you see."

Winston laughed. "I don't mind in the least, and we have most of us felt that way."

"Well," said the lad, "I was a little short of funds, and proud of myself, and when everybody seemed certain that wheat was going down forever, I thought I saw my chance of making a little. Now I've more wheat than I care to think of to deliver, the market's against me. If it stiffens any further, it will break me; and that's not all, you see. Things have gone tolerably badly with the folks at home, and I fancy it took a good deal of what should have been the girls' portion to start me at Silverdale."

"Then," said Winston, "it's no use trying to show you how foolish you've been. That is the usual thing, and it's easy; but what the man in the hole wants to know is the means of getting out again."

Alfreton smiled ruefully. "I'm tolerably far in. I could just cover at today's prices if I pledged my crop, but it would leave me nothing to go on with, and the next advance would swamp the farm."

"Well," said Winston quietly, "don't buy to-day. There's going to be an advance that will take folk's breath away but the time's not quite ripe yet. You'll see prices knocked back a little the next day or two, and then you will cover your sales to the last bushel."

"But are you sure?" asked the lad, a trifle hoarse. "You see, if you're mistaken, it will mean ruin to me."

Winston laid his hand on his shoulder. "If I am wrong, I'll make good your losses."

Nothing more was said on that subject, but Alfreton's face grew anxious once more as they went up and down the city. Everybody was talking wheat, which was not astonishing, for that city, and the two great provinces to the west of it, lived by the trade in grain, and before the afternoon had passed they learned that there had been a persistent advance. The lad's uneasiness showed itself, but when they went back to the hotel about the supper hour Winston smiled at him.

"You're feeling sick?" he said. "Still, I don't fancy you need worry."

Then Graham appeared and claimed him, and it was next morning when he saw Alfreton again. He was breakfasting with Colonel Barrington and Dane, and Winston noticed that the older man did not appear to have much appetite. When the meal was finished he drew him aside.

"You have covered your sales, sir?" he said.

"No sir," said Barrington. "I have not."

"Then I wonder whether it would be presumption if I asked you a question?"

Barrington looked at him steadily. "To be frank, I fancy it would be better if you did not. I have, of course, only my own folly to blame for believing I could equal your natural aptitude for this risky amusement which I had, and still have, objections to. I was, however, in need of money, and seeing your success, yielded to the temptation. I am not laying any of the responsibility on you, out am not inclined to listen to more of your suggestions."

Winston met his gaze without embarrassment. "I am sorry you have been unfortunate, sir."

Just then Dane joined them. "I sat up late last night in the hope of seeing you," he said. "Now, I don't know what to make of the market, but there were one or two fellows who would have bought my estimated crop from me at a figure which would have about covered working expenses. Some of the others who did not know you were coming in, put their affairs in my hands too."

"Sell nothing," said Winston quietly.

It was an hour later when a messenger from Graham found them in the smoking room, and Colonel Barrington smiled dryly as he tore up the envelope handed him.

"'Market opened with sellers prevailing. Chicago flat!'" he read.

Dane glanced at Winston somewhat ruefully, but the latter's eyes were fixed on Colonel Barrington.

"If I had anything to cover I should still wait," he said.

"That," said Dane, "is not exactly good news to me."

"Our turn will come," said Winston gravely.

That day, and during several which followed it, wheat moved down, and Dane said nothing to Winston about what he felt, tho his face grew grimmer as the time went on. Barrington was quietly impassive when they met him, while Alfreton, who saw a way out of his difficulties, was hard to restrain. Winston afterwards remembered that horrible suspense, but he showed no sign of what he was enduring then, and was only a trifle quieter than usual when he and Alfreton entered Graham's office one morning. It was busier than ever, while the men who hastened in and out seemed to reveal by attitude and voice that they felt something was going to happen.

"In sellers' favor!" said the broker. "Everybody with a few dollars is hammering prices one way or the other. Nothing but wheat to be heard of in this city. Well, we'll simmer down when the turn comes, and tho I'm piling up dollars, I'll be thankful. Hallo, Thomson, anything going on now?"

"Chicago buying," said the clerk. "Now it's Liverpool! Sellers holding off. Wanting a two-eighths more the cental."

The telephone bell tinkled again, and there was a trace of excitement in the face of the man who answered it. "Walthew has got news ahead of us," he said. "Chicago bears caved in. Buying orders from Liverpool broke them. Got it there strong."

Winston tapped Alfreton's shoulder. "Now is the time. Tell him to buy," he said. "We'll wait outside until you've put this deal thru, Graham."

It was twenty minutes before Graham came out to them. "I'll let you have your contracts, Mr. Alfreton, and my man on the market just fixed them 'n time,' he said. "They're up a penny on the cental in Liverpool now, and nobody will sell, while here in Winnipeg they're falling over each other to buy. Never had such a circus since the trade began."

Alfreton, who seemed to quiver, turned to his companion, and then forgot what he had to tell him. Winston had straightened himself, and his eyes were shining, while the lad was puzzled by his face. Still, save for the little tremor in it his voice was very quiet.

"It has come at last," he said. "Two farms would not have covered your losses, Alfreton, if you had waited until tomorrow. Have supper with us, Graham—if you like it, lakes of champagne."

"I want my head, but I'll come," said Graham, with a curious smile. "I don't know that it wouldn't pay me to hire yours just now."

Then Winston turned suddenly, and running down the stairway shook the man awaiting him by the arm.

"The flood's with us now," he said. "Find Colonel Barrington, and make him cover everything before he's ruined. Dane, you and I, and a few others, will see the dollars rolling into Silverdale."

Dane found Barrington, who listened with a grim smile to what he had to tell him.

"The words are yours, Dane, but that is all," he said. "Wheat will go down again, and I do not know that I am grateful to Courthorne."

Dane dare urge nothing further, and spent the rest of the day wandering up and down the city, in a state of blissful content, with Alfreton and Winston. One of them had turned his losses into a small profit, and the other two, who had, hoping almost against hope, sown when others had feared to plow, saw that the harvest would repay them beyond their wildest expectations. They heard nothing but predictions of higher prices everywhere, and the busy city seemed to throb with exultation. The turn had come, and there was hope for the vast wheat lands it throve upon.

Graham had much to tell them when they sat down to the somewhat elaborate meal Winston termed supper that night, and he nodded approvingly when Dane held out his glass of champagne and touched his comrade's.

"I'm not fond of speeches, Courthorne, and I fancy our tastes are the same," he said. "Still, I can't let this great night pass without greeting you as the man who has saved not a few of us at Silverdale. We were in a very tight place before you came, and we are with you when you want us from this time, soul and body and all our possessions."

Alfreton's eyes glistened, and his hand shook a little as he touched the rim of Winston's goblet.

"There are folks in tho old country who will bless you when they know," he said. "You'll forget it, tho I can't that I was once against you."

Winston nodded to them gravely, and, when the glasses were empty, shook hands with the three.

"We have put up a good fight, and I think we shall win, but, while you will understand me better by and by, what you have offered me almost hurts," he said.

"What we have given is yours. We don't take it back," said Dane.

Winston smiled, tho there was a wistfulness in his eyes as he saw the bewilderment in his companions' faces.

"Well," he said slowly, "you can do a little for me now. Colonel Barrington was right when he set his face against speculation, and it was only because I saw dollars were badly needed at Silverdale, and the one means of getting them, I made my deal. Still, if we are to succeed as farmers we must market our wheat as cheaply as our rivals, and we want a new bridge on the level. Now, I got a drawing of one, and estimates for British Columbia stringers, yesterday, while the birches in the ravine will give us what else we want. I'll build the bridge myself, but it will cheapen the wheat-hauling to everybody, and you might like to help me."

Dane glanced at the drawing laid before him, but Alfreton spoke first. "One hundred dollars. I'm only a small man, but I wish it was five," he said.

"I'll make it that much, and see the others do their share," said Dane, and then glanced at the broker with a curious smile.

"How does he do it—this and other things? He was never a business man!"

Graham nodded. "He can't help it. It was born in him. You and I can figure and plan, but Courthorne is different—the right thing comes to him. I knew the first night I saw him, you had got the man you wanted at Silverdale."

Then Winston stood up wineglass in hand. "I am obliged to you, but I fancy this has gone far enough," he said. "There is one man who has done more for you than I could ever do. Prosperity is a good thing, but you, at least know what he has aimed at stands high above that. May you have the Head of the Silverdale community long with you!"

(To be continued)

Visiting the Sick.—Neighbors, use judgment in visiting the very sick. Make known to the family you want to help when they need you. A short call at the home is always appreciated, but the chronic visitors should be told to go home. It is a grand charity to help in times of sickness. The good neighbor is one who takes home the family washing in the back of the buggy, and the twins in the front. There are some who know how to help. God bless 'em!

Nut and Honey Sandwiches.—Blanch and chop four tablespoonfuls of almonds or walnuts, and mix them to a paste with honey, spread this on buttered slices of bread, and cut into finger shaped pieces.

Curried Nut Sandwiches.—Fry one teaspoonful of curry powder in one tablespoonful of butter for five minutes, then add three tablespoonfuls of chopped nut meats, toss over the fire till well browned, then add a squeeze of lemon juice, and stir till it is a nice paste, spread on thin buttered and sliced bread, and make into neat sandwiches.

Dressing Wounds.—The Ohio Experiment Station at Wooster, O., has issued circular 126 describing the proper dressing of tree wounds after pruning. The following dressings are discussed at length: Gas tar and pitch, solid asphaltum, liquid asphaltum and linseed oil fluid asphaltum.

When the World Sleeps

—a hundred thousand lone night workers, at a thousand different tasks, lighten the long hours and hearten their labors with the fragrant comfort of fresh-rolled "Bull" Durham Cigarettes.

The telegraph operators in the darkened cities; the night herders on the silent plains; the night-watch on far-sailing ships; to each and all of them comes the longing for the cheerful companionship of these *fresh, hand-made cigarettes,* fashioned by their own skill, to their own liking, from ripe, mellow, world-famous

GENUINE
"BULL" DURHAM
SMOKING TOBACCO

(Enough for forty hand-made cigarettes in each 5-cent sack)

Medium cows	4.75@5.75
Thin cows	2.75@4.00
Milk cows	45.00@80.00

Veal calves steady.

Best calves	$11.50@12.00
Good to choice do.	10.50@11.00
Medium	7.50@8.00
Common do.	6.50@7.00
Culls	5.00@8.00

Sheep and Lambs.—There was a good disposal of the local holdings at well-maintained rates, the market closing in satisfactory shape.

Choice wethers	$5.50@5.75
Good do.	4.75@5.00
Common to medium	3.00@4.00
Ewes, fat	5.00@5.25
Extra lambs	8.50@8.75
Good to choice do.	8.00@8.50
Common to medium	5.50@7.75

Hogs.—Values were well sustained at the current range, with demand fairly seasonable. Western, as to size and quality are quoted at $11.50@11.75.

City Dressed Stock.—Every variety of choice and prime meats closed steady at quotations; trade being about normal. Steers, 11@13½c; heifers, 10½@13c; cows, 8@11c. Veal calves, 14@15c; country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@10c; extra wethers, 10½c. Spring lambs, 13@14c. Extras, 16c. Hogs, 11¾@12c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., Jan 12, 1914.

Cattle.—With a supply of 115 loads, which was about one fourth larger than a week ago, the market ruled strong to a shade higher on the low-priced grades, while the medium to good cattle with weight were only about steady. Heifers in fair supply and sold steady to strong. Cows in liberal supply, but market ruled steady on all grades. Bulls in only fair supply and sold steady to strong. Best fresh cows steady; other grades and springers slow. Today's supply was 125 loads. With a moderate demand, the market ruled steady on best grades, but a shade lower on others.

Good to choice	$8.65@8.90
Good 1,300-1,400 lb.	8.30@8.60
Medium to good 1,200-1,300 lb.	8.15@8.35
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900-1,100 lb	7.50@7.85
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700-900 lb.	5.50@6.50
Common to good fat bulls	5.00@7.50
Common to good fat cows	4.00@6.50
Heifers	5.50@7.75
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@90.00

Calves.—Veal calves in fair supply all week, and with good demand market closed 50c cwt. above Monday's prices. Today's receipts were 400 head. Demand was good and market was active at lsendy prices.

Heavy and thin calves	$5.50@7.50
Veal calves	9.00@12.50

Sheep and aLmbs.—Sheep and lambs have been in fair supply all week, the bulk of the offerings being lambs. The demand for sheep has been good. Market closed 10c above Monday's prices, while the demand for lambs has been light and they declined 10c per cwt. from Monday's prices. Today's receipts were 10 double-deck loads. With a good demand for sheep the market was active and 10@15c higher on best geades, and strong on others. Lambs slow and steady.

Prime wethers	$5.80@6.00
Good mixed	5.25@5.50
Fair mixed ewes and wethers	4.25@5.00
Culls to common	3.00@4.00
Spring lambs	5.50@8.25

Hogs.—The supply all week has been liberal and the heavy hogs for the week closed 20 cents per cwt. lower while the Yorker and medium grades closed 15c per cwt. lower. Today's receipts were 105 double-decked loads. The market ruled steady.

Prime heavy	$8.40@
Prime medium weights	8.50@
Heavy mixed	8.45@
Best heavy Yorkers	8.50@
Light Yorkers	8.50@
Pigs, as to quality	7.40@7.80
Common to good roughs	6.75@7.25
Stags	

BUFFALO LIVE STOCK

Buffalo, N. Y., Jan. 12, 1914.

Cattle.—The light receipts Monday and good demand gave a higher basis of values on choice butcher stuff that was well maintained thruout the week. On the close good cattle sold strong and the supply moderate. On this morning's market, 150 cars were sold. The market was steady on all grades.

Choice heavy steers	$8.75@9.00
Medium	8.00@8.50
Yearlings	7.50@8.00
Handy butchers	8.00@8.35
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.00@7.75
Butcher bulls	6.50@7.25
Feeders	6.00@7.00
Stockers	4.50@6.50
Cows and springers	30.00@90.00

Calves.—The moderate supply for the past week has raised the basis about a dollar per cwt. On the close the supply was large and the trade slow on the basis of $11.75@13 for good to extra. With 850 head on sale this morning, prices broke, choice selling at $11.50@12.

Choice veals	$11.50@12.00
Lights and thin	6.00@8.75

Sheep and Lambs.—The active demand and higher basis on the opening was reflected on the business of the week. The opening basis was $8.50@8.65 on lambs and $6.75@7.50 on yearlings. On the close the supply was liberal and the trade on lambs slow and lower. Culls and heavy sold dull and draggy. Sheep were in better demand and sold active and higher. Eighty cars were sold on a steady market today.

Choice lambs	$8.25@8.40
Poorer grades	6.50@7.00
Yearlings	6.50@6.75
Wethers	6.00@6.25
Ewes	5.50@5.75
Sheep	5.75@6.00

Hogs.—The offerings on Monday were liberal, but with the good demand the market was strong on the basis of $8.65@8.70 for Yorkers. On the close the offerings were liberal and the trade active on the basis of $8.65 for the run. Dairy and common hogs sold fairly good with prices lower. A run of 150 cars today caused even lower prices this morning.

Heavies	$8.40@8.50
Mixed and medium	8.40@8.50
Yorkers	8.40@8.50
Light Yorkers	8.40@8.50
Pigs	8.25@8.40
Roughs	7.50@7.65
Stags	5.50@6.50

Horses.—Some 275 head were sold this morning. The general demand was fair at steady prices.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., Jan. 12, 1914.

Hay.—Receipts of No. 1 timothy and No. 1 light clover mixed are exceptionally small for this season of the year. Demand for these grades is strong and prices are looking higher. Off grades are dull and slow sale, also threshed and clover.

No. 1 timothy	$17.50@	18.00
No. 2 timothy	15.50@	16.50
No. 3 timothy	13.00@	14.00
No. 1 light mixed	15.50@	16.00
No. 1 clover mixed	14.50@	15.00
No. 2 clover mixed	13.00@	14.00
No. 1 clover	14.50@	15.00
No. 2 clover	10.00@	13.00

Straw.—Straw arriving freely and fully up to demand. Market a little dull.

No. 1 oat	$8.75@	9.00
No. 2 oat	8.00@	8.25
No. 1 wheat	8.25@	8.50
No. 2 wheat	7.75@	8.25
No. 1 rye	9.00@	9.50
No. 2 rye	8.00@	8.50

Ear Corn.—Receipts light, with strong demand for good, sound stock. Market steady.

New No. 2 yellow	67@68c.
New No. 3 yellow	65@66c.

Shelled Corn.—Trading very active since first of year. Receipts light and demand good.

New No. 2 yellow	71 @71½c.
New yellow No. 3, natural	69 @70c.
New Sample	63½@65c.

Oats.—Demand for oats a little slow; receipts more than ample.

No. 2 white	42½@43¾
Standard oats	42¾@43
Standard No. 3 oats	41¾@42¼

Mill Feed.—Exceptionally dull for this season of the year.

No. 2 white midds, 100's	$28.00@	$28.50
No. 1 brown midds, 100's	26.00@	26.50
W. W. Bran, coarse, 100's	25.50@	26.00
W. W. Bran, medium, 100's	24.50@	25.00

TOBACCO MARKET

There is not much animation in the situation. The outlook, however, is generally optimistic. Tobacco in the hands of local dealers consists of some 25,000 cases of 1909 crop and a comparatively small part of the 1913 crop. The cigar business is in a prosperous condition, save threats of strikes by cigar-makers, and the outlook would indicate a steady demand for leaf tobacco. As yet, however, none of the large concerns have entered the market for the crop of the present year. We reported that a few hundred acres have been sold to packers at $8 to $10 per cwt. for wrappers and $12 for fillers. Meanwhile farmers are busy stripping the favorable casing weather facilitating this operation.

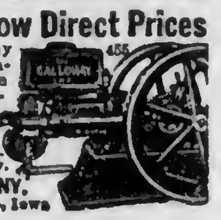
The general tobacco market was unchanged according to advice from the New York exchange. There was a good demand for old Spanish. In Wisconsin much of the new crop has been sold and delivered, and buyers are in the field seeking the remainder. The cheaper grades are now selling as high as $10 per cwt. The situation is one of great interest and activity. In the New England section there is an evident shortage of wrappers as well as binders. The 1913 crop was sold at very satisfactory prices and growers will endeavor to increase their production the present year. The New York Crop is gradually being sold at prices about the same as during the previous weeks. In Ohio the growers organization reported total sales of $100,000, during the year and reorganized for a continuation of business in 1914. Many crops there have been sold at about $8 per cwt. for seed leaf and $10 to $12 or Spanish. A larger crop will be planted if conditions permit.

The importance of the insurance of tobacco sheds was emphasized by a serious loss by fire on a farm near Marietta. A worthless vagrant was refused the privilege of sleeping in shed only to return during the night and set fire to it with the usual disastrous results. In addition to shed and a large tobacco crop two wagons and many other farm implements were lost. We note in this connection the dangerous custom of carrying friction matches from which so many fires originate. If matches must be carried they should be of the safety type and even then their composition is dangerous. The writer would no sooner carry matches than dynamite about his tobacco sheds.—H. E. Tweed, Jan. 12, 1914.

Save $50 to $300

I absolutely guarantee to save you $50 to $300 on any Galloway gasoline engine. Made in sizes from 1 3-4 h. p. to 15 h. p. My famous 5 h.p. engine —without an equal on the market—sells for $99.50 for the next 60 days only! Buy now! Same size costs $225 to $300 through your dealer. Think of it! Over 80,000 Galloway engines in use today. All sold on same, liberal, free 90 Day Trial Offer I make you--and all giving satisfaction. Isn't that proof enough!

Get My Catalog and Low Direct Prices



Write me before you buy any other style or make. Get my catalog and low, direct price on the famous Galloway line of frost-proof, water cooled engines. Free Service Department at your disposal. My special 1914 offer will help you get an engine partly or wholly without cost to you. Write today. Do it now.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our ubscribers. Each communication should state istory and symptoms of the case in full; lso name and address of writer. Initials aly will be published. When reply by mai. s requested, it becomes private practice, and fee of $1 must accompany the letter. This s one of the most valuable columns of the aper and we invite readers to make use of it. lippings from this column, when properly reserved and classified, would make one of he most valuable medical symposiums a armer-stockman could obtain.)

Heifer has Warts.—During the spring f 1912 we bought a two-year-old heifer. t that time she had a small wart on eft eye lid. We did not think that uch harm would result, but now the art is about the size of an English alnut with a cracked, rough (not sore) urface. Here and there over the body nd head small warts are appearing, anging in size from a large shot to a azel nut; also rough in appearance. The heifer is now fresh and otherwise s a promising young cow, eats good nd appears healthy—milk very rich nd clean. Would you consider it all ight? Can anything be done to overome these warts? A. F. S., Piketown, Pa.—The nicest way to get rid of a art is to remove it with scissors, or wist it off with the fingers, or forceps, r ligature by means of a rubber band, ilk thread, linen thread or horse hair; hen, apply tincture of iron to roots. y applying sweet oil or castor oil hey might go away and you had beter give her a tablespoonful of Fowler's olution at a dose, 2 or 3 times a day. er milk can be used with safety.

Tongue Loller.—I have a seven-yearld mare that, when traveling on road, sually hangs tongue out of mouth to ft side. I am anxious to know if this a disease and what I had better do bout it? H. L., Hartsville, Pa.—This a habit. I hardly know how it is acuired, unless it is the result of improerly bitting a colt before it is driven harness. Invariably a tongue loller laces tongue over bit and then drops ongue out of mouth. In some cases I ave overcome the difficulty by placing ar bit by means of a nose strap in roof mouth; in others bending a bar bit that it arches to roof of mouth, leavg a place for tongue under bar center. here are also bits made with a plate or oon fastened to center of bit which tends well up in mouth, preventing a rse from getting tongue over bit. urthermore, a steel bit covered with ather or a chain bit covered with rubr sometimes overcomes this difficulty. hese hints may lead you to figure out e best appliance to overcome the diffilty.

Fibrous Growth.—I have an old, but ry good cow that has a swelling as rge as my two fists along side of her ctum. Swelling does not seem to be ry sore, not much if any inflamed and does not appear to give her any inonvenience or pain. This bunch has a rt of fleshy feeling and came on her out four weeks ago. It seemed to ow itself two weeks before she calv. It has not enlarged much if any nce calving time, but has not decreasin size. Is her milk fit to use? G. I. ., Paxinos, Pa.—It is possible that she ceived a blow which produced a seris abscess or caused a fibrous bunch to ow. Apply 1 part tincture iodine d 3 parts camphorated oil to bunch, e a day, and if the bunch is soft, ctuating at all on pressure, it should opened. Then inject small quantity tincture of iodine a few times and e will soon get well. A bunch of s kind will not in any way affect e quality of milk.

Ringbone.—We have an old white rse which we recently purchased that sound in every particular, except has a ringbone on each hind leg. far as I can tell, he is not lame and a good work horse. If these bunches uld be taken off without leaving a ar, it would make him much more lable and for this reason I would e to have him treated. M. K. S., rth Branch, Pa.—A horse of this d should be left alone, for it is possi to make him lame by applying treatnt. I am sure it is bad practice to anything for him until such time as shows soreness or lameness.

Scurvy in Hogs.—Nearly all my hogs m to have a rough scaly sort of skin, t nearly all of them are thriving. hat had I better do for them? F. T. , Hookstown, Pa.—Apply 1 part coalr disinfectant and 10 parts vaseline, ice a week. I find hogs are much re quiet to handle during the night.

$1.00 Puts It On Your Farm

THE CHATHAM
Grain Grader and Cleaner
Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut.
Cleans the dirtiest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.)
Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet "slick as a whistle."
Takes Buckhorn from Clover.
Sorts Corn for Drop Planter.
Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc.
Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Easiest running mill.

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain

You can't afford to plant common Seed and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for one paltry dollar.

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my "Chatham," send it back at my expense and I will return the dollar.

A "Made-to-Order" Machine

Every "Chatham" is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality*. That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience.

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this.

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my Book by return mail. Address nearest office.

Horse Owners Should Use
GOMBAULT'S
CAUSTIC BALSAM
The Great French Veterinary Remedy.
A SAFE, SPEEDY & POSITIVE CURE.

Prepared exclusively by J. E. Gombault, ex-Veterinary Surgeon to the French Government Stud.

SUPERSEDES ALL CAUTERY OR FIRING.

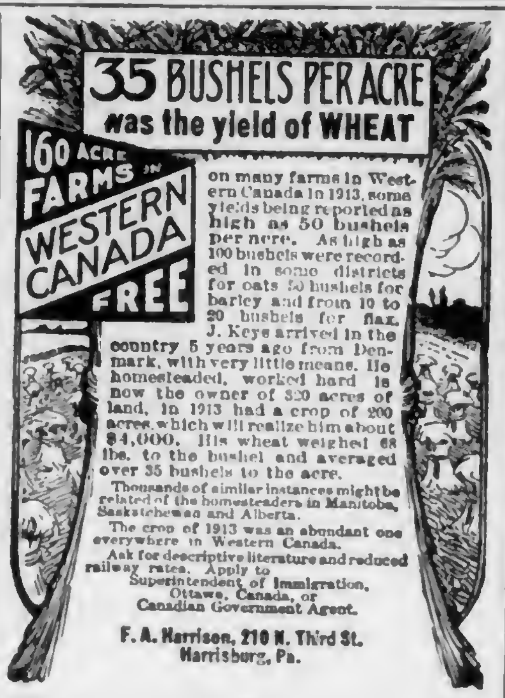
Impossible to produce any scar or blemish. The safest best blister ever used. Takes the place of all liniments for mild or severe action. Removes all Bunches or Blemishes from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

WE GUARANTEE that one tablespoonful of Caustic Balsam will produce more actual results than a whole bottle of any liniment or spavin cure mixture ever made.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.



35 BUSHELS PER ACRE was the yield of WHEAT

160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard is now the owner of 320 acres of land, in 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

Ask for descriptive literature and reduced railway rates. Apply to Superintendent of Immigration, Ottawa, Canada, or Canadian Government Agent.

"We fed 'Sal-Vet'" while campaigning the fairs with Aberdeen Angus and Brown Swiss cattle, and we are satisfied that it is all that you claim for it."—Robinson Bros., Rt. 3, Meadville, Pa.

"I lost five hogs from cholera; at least that is what one expert pronounced the disease. I then started to feed "Sal-Vet" and the remaining hogs have done fine ever since, and have developed tremendous appetites."—Joseph Lambright, R. 1, Bx. 59 Fishers Ferry, Pa.

"I can say that since feeding "Sal-Vet" my horses have been passing large numbers of pin worms and also some large intestinal worms, all of which were dead." Guy M. Dietterich, Rt. 2 Wapwallopen, Pa.

"One of my young horses would not eat until I gave him "Sal-Vet." It not only restored his appetite, but expelled more than a peck of worms from him, and he no longer looks like the skeleton that he did before. I can recommend "Sal-Vet" to do more than you claim for it."—(Signed) Samuel F. Moyer, Stouchsburg, Pa.

WORMS KILL HOGS

By The Thousands

SIDNEY R. FEIL
Reg. Phar.

Pres.
The
S.R.Feil Co.
Mfg.
Chemists

Mr. Feil
is a Registered Pharmacist, a graduate of the Cleveland School of Pharmacy and of the National Institute of Pharmacy. He has been engaged in laboratory work for more than twenty-five years and was formerly assistant to Dr. Nathan Rosewater, former Chemist of the Ohio State Dairy and Food Commission, for many years has been engaged in compounding veterinary remedies.

90% of hog losses are caused by worms. Hog Cholera and Swine Plague, which sweep thousands and thousands of hogs away every year, *are always more fatal to wormy hogs.* Worms multiply by hundreds—they lower the vitality; consume the animals' feed; weaken and render them easy victims of disease. When contagion breaks out, it is usually the *worm-infested* hogs which first contract disease—and die. Get rid of the worms and your losses will be materially lessened. I'll show you how—

I'll Stop Your Losses From Worms

or no pay. I'll make your hogs worm-free—healthy—vigorous. I'll put them in condition to better *resist disease.* I'll prove it before you pay me a penny. Read what some of the thousands of farmers say who have taken me at my word—who have accepted my "no-money-down—no-risk-offer" below.

I'll Feed Your Stock SIXTY DAYS BEFORE You Pay

I'll prove it to you on your own farm—on your own stock that **Sal-Vet** is the greatest worm destroyer and live stock conditioner you ever fed. This is not a new offer—I've been making it for five years. Over two hundred thousand farmers have accepted it and obtained remarkable results.

TRADE MARK
SAL-VET
REG. U.S. PAT. OFF.
KILLS WORMS

—stops the drain on vitality; makes stock thrive better; makes them better able to resist diseases; improves their condition—increases your profits.

There is no dosing, drenching or bother—no trouble to feed **Sal-Vet**. Simply place it where stock can get at it. Then you will see how it acts and how the animals fed will expel all disease-breeding stomach and intestinal worms.

REAL PROOF

State of Illinois, Illinois Farmers' Institute.
"As soon as the 'Sal-Vet' was received, we began feeding it at once to our sheep, that had been dropping off with no warning whatever. Am glad to say that we have lost only one since that day, but no more. Horses, hogs and cattle have done splendidly since having free access to 'Sal-Vet', and I am free to say that I never had better success with any preparation, than I have had with yours."—J. B. Burrows, Director Farmer's Institute, 19th Congressional Dist., Decatur, Ill.

"My next neighbor lost his hogs from cholera and my hogs were afflicted with a terrible cough. After feeding 'Sal-Vet' for three weeks, they have stopped coughing and they are now eating nearly double what they did before, and I have not had a sick hog since.—J. W. McGaughey, Rt. No. 1, Box 58, Worden, Ill.

"'Sal-Vet' is all you claim for it. It brought lots of worms from my colts and pigs."
S. L. McGowin, Mason, Ala.

"I am feeding 'Sal-Vet' and find it is without doubt the best medicine for hogs I ever saw. It is ridding my hogs of worms by the hundred, and I am recommending it to my neighbors, several of whom have decided to feed it too."—Walter Gray, R. No. 4, Huntsville, Mo.

No Money Down—No Risk

You take no risk—you don't pay me a cent until I prove my claims. Right now you need **Sal-Vet** while your hogs are on new corn. You know that Cholera always comes with the feeding of new corn. This year especially it contains worms in abundance which develop and multiply in the animal's stomach and soon their deadly work begins to kill off your hogs. Prevent your losses from worms this year by feeding **Sal-Vet**. Begin NOW. Just fill in the coupon—tell me how many head of stock you have and I'll ship you enough **Sal-Vet** to last them 60 days. At the end of 60 days report results. If **Sal-Vet** does not do what I claim—if it does not rid your stock of worms as stated, I'll cancel the charge and you won't owe me a penny.

Look For This Label
Don't buy "Sal" this or "Sal" that. Get the original, genuine Sal-Vet prepared only by the S. R. Feil Co., Manufacturing Chemists, Cleveland, Ohio. Don't be deceived by imitations.

Farmers' Marketing Problems.

By SHELDON W. FUNK,
Berks Co., Pa.

As a State Farm Adviser and an institute lecturer, it has been my good fortune to visit a number of localities in which the farmers have been far sighted enough to see the great advantages to be derived from co-operative selling. As a gardener and fruit grower, my observations have been mainly along these lines, but what is applicable to fruit and vegetables will also apply to farm produce in general. Several years ago I visited a community where they had a large quantity of apples, many of which were rotting in the orchard. These people had always depended upon buyers to come to their section and purchase the fruit out of the orchard. The price had always been low, but still they were fairly well satisfied because this method eliminated much of the harvesting trouble and also because they had never taken the pains to investigate outside market conditions.

The year of which I speak happened to be a good apple year over the entire country. The cold storage plants had more apples booked than they could handle, and storage for the late comers was simply out of the question. Realizing this fact the buyers went into the section and where heretofore they had been accustomed to paying from $1.75 to $2.00 per barrel, they now offered from 60 to 75 cents per barrel even tho at that very time apples were listed on the market at from $2.50 to $3.00 per barrel. Some of the farmers finally sold at 75 cents, but others became indignant and decided to rent storage for themselves. Failing in this and not knowing a good commission man in the city, they were unable to better the situation; but rather than sell to the buyer at 75 cents per barrel, they allowed the fruit to rot in the orchard. On the other hand, men who had procured storage before the picking time realized, during this same year, from $3 to $5 per barrel. This is only one instance of many with which I have come in contact in which the producers were entirely at the mercy of the buyer.

We often hear the statement that prices are governed by supply and demand and this is true with a staple product as apples or potatoes, for instance. But frequently with more perishable produce, as peaches and some vegetables, the price is governed by the supply and demand only for a limited territory. I have in mind several such instances in the peach market this last year. One small area in particular, say with a diameter of 50 miles, had almost a full crop of peaches. Practically all of this fruit went into one market in southeastern Pennsylvania. For a time that market was glutted and prices dropped as low as from 75 to 90 cents per ½-bushel basket of very nice fruit; while within a distance of from 100 to 200 miles from this very market the people were clamoring for peaches at from $1.75 to $2.00 per ½-bushel basket. The growers could not take advantage of this opportunity because they had no one to tell them concerning outside market conditions. Even had they been aware of these prices they could not have shipped in bulk because most of the growers did not have a sufficient amount of fruit ripening at one time to fill a car, and not being organized they could not ship together.

The section around Norristown, Montgomery County, is very well adapted to the growing of fruit and vegetables; in fact, nowhere else in the state have I found peaches planted so generously. Five or six years ago these men worked on the plan of survival of the fittest. They carted produce to Norristown and took whatever they could get. Say, for instance, that tomatoes were selling at 35 cents per basket. Mr. Jones comes in with a rather large load today. Fearing that he will not be able to close out he drops to 30 cents in order to unload faster. Tomorrow Mr. Brown comes in with a load at 35 cents. He soon learns, however, that Jones sold his at 30 cents; so Brown, thinking that the market is glutted, becomes frightened and drops to 25 cents. By the end of the week tomatoes are selling at 15 cents per basket, at which price there is no money to be made.

This, I say, was the case a number of years ago. But these men soon realized that they could not make ends meet with such systems of marketing. So a number of them, with A. R. Tyson as their leader, formed what is known as the Norristown Wholesalers' Association. The membership fee is $1.00, but there are no dues, the only requirement being that members refrain from retailing fruit or vegetables in Norristown. These men then went to a leading commission merchant in their town with a proposition, viz: to handle the Association's products exclusively at 10 per cent commission. All of the produce grown by these men is now taken into Norristown and unloaded at the commission house, after which the team goes back to the farm, without wasting time in retailing. The commission house then disposes of the produce, taking care to get best prices. The growers are no longer compelled to

MAIN BUILDING OF THE SPARKS AGRICULTURAL HIGH SCHOOL, BALTIMORE CO., MD.

sell at a sacrifice because they can control the market.

Granting that tomatoes are again selling for 35 cents and there is a sudden glut in the market, instead of overstocking Norristown with tomatoes the commission man keeps in touch with the outside markets. If prices are right in the coal regions they pack a car and ship there. If prices are low in all markets the tomatoes are shipped to the canneries. Even granting that no profit is made on the goods shipped, which is not the case, they at least relieve the Norristown market and keep prices level there.

It is an easy matter to drop the price of a commodity but it is not nearly so easy to raise it. In our smaller towns, where prices are not governed so much by supply and demand, a drop in price is usually permanent. What the growers of Norristown can do, others can do as well. If we are to receive our just share of the proceeds from our crops today we must fight for them, and the best way seems to fight a trust with a trust.

Those who watched the apple market last year will remember that the wholesale price of apples held for a long time at from $2.50 to $3.50 per barrel. Returns did not go higher until May when apples were becoming very scarce. Then prices jumped to $4 and $5 per barrel. But while the producer was receiving $2.50 and $3.00, the consumer was paying $5 and $6. If he bought in half-bushel lots, he paid at the rate of $7 and $7.50 per barrel. What was the result? At $7 per barrel the consumption of apples all over the country is much less than when the prices are $5.00 per barrel. By holding up the price to the consumer, the middleman lowered the demand. In this way he naturally held down the price to the producer and increased his profits at both ends, at the same time handling fewer barrels but making more money.

We producers need middle-men, that is, a certain number of them, and we are willing to allow them a reasonable profit for their services. But when they try to rob us by taking as much as 50 percent we are naturally going to object. To suit our purpose, Lincoln's famous statement might well be changed to read "you can rob some of the farmers all of the time and all of the farmers some of the time; but you can't rob all of the farmers all of the time." We believe the day is not far distant when there will be a co-operative selling association in every community; communities will be united, and they will grow those crops which are best adapted to their conditions and their markets. Where possible they will deal thru an honest commission man; or if they cannot find such, will take a good hustling young man from their own community, put him in the city and give him a salary or a percentage to keep track of all the markets and handle all their produce direct. In this way the farmers will receive a higher price for their products; the consumer will be able to buy his food at a lower figure and any dishonest commission men will be compelled to look elsewhere for a living.

An Object Lesson in Potato Growing.

Every man who grows potatoes knows that in every row he finds hills where every potato comes out with tops, and others where, in pulling, he fails to get a single one, but finds them distributed all through the hill. This fact we all have noted, yet, somehow, I question if any of us have taken in the full significance. For some years I have been experimenting with seedlings direct from the seed boll. Having three distinct varieties, with different characteristics, they have been planted side by side and given like treatment to find what each could do.

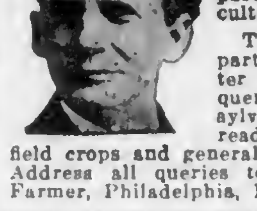
In digging in 1913 I was struck by the fact that in every hill in No. 1, each potato clustered about the center. Finding this at the start I carefully noted every hill only to get the same condition. The total yield was good and the general type desirable. When I struck No. 2, something different was seen. There was not a potato about the center, and hardly any within six or eight inches. Every one was at the extremity of the hill. This held thruout the row. It set my thinker at work, and I found myself asking this question: If I was obliged to choose one of the two varieties, and everything else was equal, which would I take? That is, if distribution of tubers in the hill was the only visible difference, which one would I select? What say you, readers of the Pennsylvania Farmer? There is a reason for or against any choice, and we want to find it to help over some other hard places. It must make a big difference when we come to select seed. I have none to sell, so there is no little joker here; but I was so stirred in my field that I want to stir others.

I have asked this question in many laces when speaking, and find a difference of opinion. There is forced upon me the conviction that here, in this seemingly little matter of location of tubers in the hill, is one of the important factors in potato growing. Without question potatoes absorb food, and if so, the wider distribution seems desirable, provided the food supply is scattered thru the hill.

Answering the query by my own experience, I certainly would take that variety which was most removed from a given center, being certain of larger yield, if not of higher quality. Surely I would also look for greater uniformity than when crowded about the middle of the hill. Very likely others have solved this problem and have their line of action well established but, going thru many fields, and noting the marked differences in this respect I am led to put the proposition before the readers of the Farmer and ask their experience.

We want more and better potatoes in every hill. How can we get them? In a prominent prize contest, the past year, the highest prize was won by a Maine man with 502 6-10 bushels from a measured acre; but the best part of the story is that these graded 75.28 percent table size; 10.67 percent too large, and 14.05 percent too small. This lot carried17.17 percent of starch, thus attesting their quality for the table. If this grower can eliminate any part of the over-large, that is, more than 12 ounces, or under-sized, those below 4 ounces, how greatly would the crop be improved! No man knows to what extent this can be done, and it offers one of the attractive lines for the wide-awake worker and thinker. Potatoes are to form one of the leading cash crops on the majority of farms, but there are fundumental principles at the heart of the problem that we must work out and apply. Out of the experience of many this can be done, provided each one follows a single thread to a fixed conclusion. In this way we can all be helpers, one of the other.—Dr. G. M. Twitchell, Androscoggin Co., Me.

Farm Counselor Department



By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Top-Dressing Wheat

"I want to give my wheat a top-dressing of commercial fertilizer in the spring. The fertilizer is a 2-10-5 formula, made of high-grade acid phosphate, tankage and muriate of potash. How soon in spring should it be applied for best results? Should it be harrowed in with clover seed, or left on the top of the ground?—W. F. H., Maryland.

Our correspondent touches upon two practices that are proving to be beneficial: The top-dressing of winter grain and grass, and harrowing in the grass seed in the spring. The time to apply both the grass seed and the fertilizer is as soon as the soil is dry enough to harrow. Tie up the metal hose of the grain drill so they will not drag, and use as in other drilling. Then sow the grass seed. To cover, use a spike harrow—a 50 or 60-tooth steel frame preferred. Slant the teeth back one notch. Harrow the same direction the grain was drilled. It is sometimes necessary to give the harrowing a half lap if the soil is clayey and baked hard.

A few have been recommending this method of seeding winter grain to grass for years, but a great many farmers are afraid to harrow their wheat and rye in the spring. All such seeding has been done this way at the Homestead Farm for ten years and we have never failed to have a perfect stand. Harrowing the grain benefits it as it breaks up the hard, caked surface. It insures the covering of the grass seed and to such depth that it does not die after sprouting if a spell of dry weather follows as is the case when left on top. The practice of sowing the grass seed on the snow or the supposed last frozen ground, leaves a great deal of seed to die on the surface, and is at best a hap-hazard method.

When Doctors Disagree

I have been reading recently two books on soil fertility, written by two eminent authorities. I find much in each that is helpful and instructive. The findings of intelligent men of research are well worth study by student and farmer. The unfortunate part is that opposite opinions concerning some very important matters are put forth so emphatically as to almost leave the impression that a contentious spirit occasionally gets the better of the scientific mind. Assuming that a thing is true and then setting out to prove the assumption to be right is not scientific investigation.

But even these differences should not discourage or lessen our interest in the work of these men. They are worthy of a study. In the meantime, let us put into practice the things upon which men agree as necessary in order to maintain fertility, viz: control of soil moisture, deeper plowing and more thoro cultivation; the proper care and application of manure; the increase of humus-making material by heavier sods, and the cover-crops; proper rotation and the judicious use of fertilizers.

A Correction

A typographical error in answer to H. C. K. on page 23, issue Jan. 10 makes it read 11½ percent nitrogen when 1½ percent was meant.—R. P. K.

LAYING THE FOUNDATION RIGHT

When plans are in the making for farm work, it may be well to get down to fundamentals and reconsider foundations. Is the farm being conducted on right lines in its general outlay and plan? Do the man, the farm, the location, and the type of farming "nick well?" Perhaps no one thing more often prevents success than the failure to make these things harmonize.

First to be considered is the man himself. What are his tastes, temperament and natural ability? True success must come in the line one loves, and the first problem should be to get into that line if possible. Unfortunately we are so constituted that we cannot always justly estimate our own abilities and shortcomings, but so far as we may, they should receive great weight.

Are we adapting our work to the farm, to its soil, its topography, and its location? Perhaps we are keeping a dairy on a dry and poor watered farm much better adapted to fruit or to sheep; or better fitted to grow hay. The choice of a farm is of primary importance and should be governed first of all by the tastes of the farmer. To the farmer already located the solution of the problem must often lie thru compromise, rather than thru change of farms.

Land values may influence materially the type of farming. Where the capital value of land per acre is high, the crops and the methods must be intensive to afford adequate return on the investment.

Where values are low, money may yield a better return invested in land than invested in labor. In other words it may be more profitable to farm more land and get from it less per acre than to farm less and farm it better, with a higher yield per acre. It should be remembered that the product per man is more important to the farmer than the product per acre, altho to the community at large the latter may be of greater concern.

The relation of buildings to type of farming is important. Dairy farming calls for a heavy outlay in buildings and building equipment, while sheep farming or fruit farming demand relatively little. This is an important consideration to the man of limited means.

The distance from the market or shipping point, the character of the highway between, and the shipping facilities beyond all have an important bearing on the problem. Potatoes are a good money crop on a farm where soil and climate are right, but if that farm lies far from the shipping point the cost of hauling may be too heavy a charge to make them profitable. I have loaded fifty or more dollars worth of purebred pigs into a one-horse spring wagon and started off to the railway station on the trot, when to have delivered the same value in potatoes at the prices prevailing at the time would have taken at least three slow trips with a team and heavily-loaded wagon.

The available market is of primary importance in the problem of adaptability. My own farm is remote from large markets. I must compete in the great general markets of the country or in the personal market which can be reached only by advertising, and thus

securing the individual customers whom I never meet face to face. The man who can load his wagon with whatever may happen to be available from the farm and drive directly to the consumer may succeed with crops and with methods which to me would be ruinous.

I must look first to the producing end, must produce as much and as cheaply as possible of those things which go to the great wholesale markets. He must look well to the selling end to see that the cost of selling does not more than offset the extra price which he receives. It may pay better to produce more and sell at the lower wholesale price than to get the higher retail price with the added cost of selling and the smaller production which is likely to occur.

The character of the community, likewise deserves consideration. If producing for the general wholesale market there is a manifest advantage in being in harmony with the neighborhood, particularly if that neighborhood is known for any special line of production. This brings more buyers and better marketing facilities.—Fred W. Card, Bradford Co., Pa.

County Farm Demonstrators

WILL THEY FULFILL THEIR MISSION?

By Prof. A. L. Clark, New Jersey Experiment Station.

It is said that County Demonstrators will fill the gap between the Experiment Station and the farm; that they will take to the farmers the results obtained at the experiment stations. This alone will be a big undertaking. It has only been in the last few years that this particular line of work was considered important enough to have special departments and qualified men connected with the stations to do some of this extension work. In the past much of the benefits of costly and painstaking experiments have been lost because they were not placed before the farmers in a manner interesting enough to attract their attention and practical enough to command their respect. Very few people who are not themselves practicing farmers are able to thoroly understand the farmer's viewpoint and so are unable to make convincing arguments or discuss farm problems intelligently with them. Then again, the more general principles of soil fertility and crop production are becoming much more widely understood and the demands are becoming greater for special knowledge in certain lines of work. This condition makes it more difficult for the college professor or station worker to carry on this kind of work, and more necessary to have a practical man in each district.

There are a hundred other ways that the farm demonstrator can aid the farmers in his district. As a nucleus for the exchange of thoughts and methods he should be a source of learning. Many localities need only a leader to help them in organized efforts. True rural co-operation includes many more things than just buying and selling. In some places it may well develop into some special crop production. The soil and climate may be found to be especially adapted to the raising of a certain variety or crop. Or the type of farming carried on may be found to be desirable for some certain system of production. Then again, the labor problem, fast becoming more and more difficult to overcome, may require the special attention of the demonstrator. Co-operative ownership of superior breeding sires may well be developed by allowing an uninterested party to have charge of the management. By comparison, such a man in any community can undoubtedly select the best special methods practiced in the county, aid in the selection and distribution of seed particularly adapted for the purpose and conditions at hand, and so, in a thousand ways, find opportunity to assist the producers of the necessities of life in becoming more efficient.

Are We Expecting Too Much

It seems to be a very common opinion among those who have become interested in this work that it will very likely be an exceedingly difficult position. We may as well acknowledge that as a class farmers are not eager to take advice or to acknowledge self deficiencies. Because farm life is naturally independent and somewhat isolated, we have become imbued with the ideas of self sufficiency. It is a matter that every farmer should give heed to, however, that in the most prosperous communities this characteristic is lacking and at the same time real independence has grown with prosperity, and the spirit of initiative and industry has become accentuated.

The great question which every county should ask itself is, how are we going to receive this farm demonstrator. Are you going to take him into your midst and act toward him as a paid expert to get right into the game and do all he can to make farming in your county more prosperous? Are you going to listen to his advice? More than that, are you going to take your problems to him and discuss them? Are you going to show your confidence in him from the start and so pave the way toward general benefits to all? There will be plenty who will hold aloof, thereby not only preventing themselves from securing much benefit but by example inducing others to do the same.

Any man, no matter who he may be or what he may know, is going to make many mistakes. If it was possible to secure the best farmer in each county at present to act as the demonstrator, there would be many mistakes made. Those who seem to realize their mistakes the least are the ones who are going to find the most mistakes in the expert. One of the really big things for the demonstrator to do is to learn. He will be in the best possible position to learn all the ins and outs of farming in the county. If he will only do this it seems that he cannot fail to do a great service; for a man cannot be full of good things and mix with other men every day who want some of those things without imparting a considerable part of his supply to them.

It should not be the duty of the agent to attempt to distribute his wares, in this case knowledge, promiscuously. To accomplish any real good they must be received in the proper spirit. Advice should be only given when asked. It will be entirely impracticable for him to act the part of an efficiency expert in a manufacturing plant or business house. It would be ideal perhaps in some ways if he could have the liberty and the power to enforce progressive business methods on all farms in his county. However, I do not think we want to see such practice. The independence of farm life should by all means be preserved, but the people should receive the agent with open arms and work with him and assist him, all to the end of making their farming more efficient. He can do nothing without the aid and support of the people.

We should not expect him to come into our midst and work great changes or introduce improved methods of combatting plant diseases, fighting insect enemies, growing better crops or building up the soil without the co-operation of a large part of the farmers. There is bound to be a number of self satisfied, "do as my father did" kind that will act as a millstone around the agent's neck. Which are you going to be, an open-mined, courageous co-worker, or a scoffer and a hindrance to progress? There is no use of expecting too much. Hope for much, expect little and be on the lookout for opportunities. There should be no shadow of doubt in any thinking man's head that much improvement is bound to come from having a trained man in a community to act as a distributing agent of special knowledge and a binding link for organized progress. The best qualified men for these positions can not be induced to take them. The point I wish to make is that any intelligent, more or less trained and observant man, can add greatly to the output of a farming community provided only that the farmers themselves do their part.

The Requirements of a County Demonstrator

This is a very serious problem, especially when we realize that no men can be secured that seem to come up to the standard for this work. The biggest part of the whole proposition is the beginning. If a man can stay in a district three years and have any support at all he should be able to show by that time the wisdom of certain reforms or improved methods, simply thru his personal observations. A man will not stay, nor can he work with any degree of earnestness, unless he has the support of the farmers. So that the first thing for an agent to do is to secure the confidence of his future co-laborers. Here is where "personality" in the farm demonstrator will count. In the first place he must be imbued with the spirit of helpfulness.

Actual farm experience is absolutely necessary to enable one to realize the farmers' problems and offer solutions in a practical way and in such a manner as to be received and acted upon. Special experience in the certain lines of production carried on in the county is an excellent asset. A broad general knowledge of the principles of crop production and animal husbandry is of vastly more importance, together with an acquired or natural instinct toward systematic effort. At the present time there are no trained men for this kind of work. The men who undertake it must map out their own line of work with no past records of work achieved or results obtained to guide them. So a man must have plenty of that power of initiative and then the determination to stick to what he believes is the proper course in spite of criticism and fault finding.

The Position, the Work and the Man

I think when we consider the proposition as a whole and from the standpoint of the farmer and the demonstrator we will all agree that it is a difficult position to fill. This should not lead us to hesitate about pushing this work. On the contrary it should be an incentive toward every resident in a community interesting himself in the movement and giving it his moral support. There could be no more helpful effort than to have the dwellers in the villages and cities join with the rural people in this undertaking and so not only add to the range of helpfulness but aid greatly in bringing into closer connection the producers and the consumers, the farmers and the city people.

The man must be qualified without a question. He will have untold problems to solve; a new road to hew thru an unexplored country. It seems to me however, that the greatest question before us today in this matter is how are the farmers going to receive this agent.

LINWOOD HAINES LTD.

Haines Wood Pumps

These should not be compared to the many light-weight inferior pumps found on the market. The Haines Pumps are guaranteed against defective workmanship. Made from best selected stock, well painted and varnished, with iron spouts, metal buckets and brass valve seat. All at Haines factory-to-you prices.

	Plain.	Porcelain.
8N303—6 ft.	$2.75	$3.45
8N304—7 ft.	$3.00	$3.75

Pitcher Pumps

Made of heavy castings of first grade iron. Iron cylinders bored true and highly polished. Brass cylinders of heavy seamless brass tubing.

	Iron cylinders.	Brass cylinders.
8N321—2¼ in. cyl.	$1.10	$1.85
8N322—3 in. cyl.	$1.20	$2.15
8N323—3¼ in. cyl.	$1.35	$2.35

Haines Special Wood Pumps

These Wood Pumps are superior to any iron pumps. Greater pumping capacity, work easier, and last longer. Saum's patent buckets, always fit, cannot become saturated and swell tight in cylinder.

	Plain.	Porcelain.
8N309—5 ft.	....	$3.80
8N310—6 ft.	$3 25	$4.15
8N311—7 ft.	$3 55	$4.40

Drive Well Wood Pumps

Lower cap threaded for iron pipe 1¼ and 1½ inches.

	Polished Iron or Porcelain Lined.	Brass Lined.
8N313—6 ft.	$4.40	$4.90
8N314—7 ft.	$4.70	$5.20

Please order by number and inclose check or money order to cover. Pumps shipped f. o. b. Camden, N. J.

This Girl Could Not Walk or Stand
—at the age of four

Pink Vosburg, daughter of Mrs. Sula Vosburg, Bedford, Ia. Mrs. Vosburg brought her daughter to this Sanitarium January, 1911, for treatment of Infantile Paralysis. The child could neither walk nor stand alone, but could only crawl on her hands and knees. She was here eight months; now walks, goes to school and gets about splendidly. Mrs. Vosburg will affirm the above.

This is not a selected case, nor are the results unusual.

The L. C. McLain Orthopedic Sanitarium

is a thoroughly equipped private sanitarium devoted exclusively to the treatment of crippled and deformed conditions, such as Club Feet, Infantile Paralysis, Hip Disease, Spinal Diseases and Deformities, Wry Neck, Bow Legs, Knock Knees.

Let us advise you regarding any crippled, paralyzed or deformed child or person in whom you may be interested. It will cost you nothing, and in view of over 30 years' experience in this work, our advice should be valuable. Our Pamphlets and Book of References will be sent postpaid and free of all charge, on request.

The McLain Orthopedic Sanitarium
905-R Aubert Avenue, St. Louis, Mo.

Get My Big FREE BOOK OF Buggy Bargains

Horticulture

ADVANTAGES OF A FORCING HOUSE OVER A MANURE HOTBED

At this time the farmer is urged to make hot beds as a step toward having early vegetables. For this purpose the old-time standard advice is to build a manure hotbed by digging down into the ground and filling the hole with fermenting manure, or by putting the manure on top of ground and boarding up the sides, covering the bed with glass, etc. The young man, or the old man, who has not tried this antiquated method will almost always fail the first time. The manure does not heat as he expects it will or it gets too hot and burns out, or he gets too little earth on top and puts his seeds in before it has cooled down enough, hence burning his seed to death. Then if all does go right until he gets his plants started, there comes a blizzard when he dare not raise the sash to look at and air his plants, and when he does look they have spindled up and become so tender that they are ruined.

A New Method

My present plan does away with all those inconveniences and may be adopted by any farmer in a limited way at little expense. At the same time it furnishes a pleasant and enjoyable pastime for the weaker members of the household. Just build a frame, say 10 ft. square with a gable roof, and stretch a 4-yard-wide cotton covering, well oiled, over it Make a common shelf stand with cross boards along each side to set plant boxes upon. Run a stove pipe under this stand and out of the house at one end; have a small second-hand stove, or one of these sheet-iron heaters that cost only $2 or $3, to heat the house with. Put the stove down low in the dirt on one side; have shallow boxes 1 ft wide 18 in. long and 3 in. deep. Fill these with fine earth, pressed down smooth with a flat board.

SPRAYING THE APPLE ORDHARD ON THE RUTGERS COLLEGE FARM, N. J.

Then sow seed of any kind thinly on top of the earth and sift a covering of fine earth over the seed. Then press down again. Set the box on the cross boards over the stove and all along and above the stovepipe. With a cover well oiled with boiled linseed or paraffin oil, the amount of heat that will be developed inside at the time of year when the sun is getting high will astonish anyone who has never tried it. You will rarely find a day after March 1 when the house will not be warm enough without fire in the stove.

As soon as the plants come up the cabbage, cauliflower, lettuce and such kinds should be put back from the stove and allowed to grow slower, as they soon become too slender in the warm inside air.

The Work of Transplanting

When the plants show the third or fourth leaf they should be transplanted into other boxes of the same size. If I have plenty of space I put 24 plants in a box 1 ft. wide and 18 in. long—6 plants one way and four the other. If I want to crowd I can put 48 plants in one of these boxes just as well. At time of transplanting other boxes of seed can be sown, and all lettuce, cabbage, celery, beets and such plants can be moved out of the house and put under cold frames covered with plain cotton cloth until hardened enough to be exposed to outdoor air, which will take two or three days' time. After that they can be set out or be left standing in the boxes until you want to use them. The tomato, pepper, egg-plant, cucumber, melon, squash and like plants are taken out later and hardened in the same manner—by first putting under cloth covers, then with covers off at night, then in the shade of a building, fence or tree, and lastly right out in the open sun. By this process I raise tomato and even cabbage plants that can be set out in the hot sun in the middle of the day without ever wilting or showing any stoppage of growth.

The house system enables one to control the heat by regulating the fire and by removing the boxes from one part of the house to another, when occasion demands. One can stand up there or sit down to his work, while with the old manure hotbed system one has to stoop or kneel and work in the cold raw winds in order to secure success. The plant house described will not cost any more than a hotbed of the same capacity.—A. M. Smith.

GROWING FROST PROOF CABBAGE PLANTS

In former years we found it impossible to grow cabbage plants from spring sown seed, of sufficient hardiness to stand early setting. The plants were always spindling and tender so that they had to be protected in the hothouse until settled weather. Then when set, unless conditions were exceptionally favorable for their growth, they would not head in time for the early market. Of late years we have been sowing the seed in the fall in a cold frame and wintering the plants over. By this method we have been enabled to harvest our cabbage crop early, and have won no little reputation among local gardeners as growers of hardy cabbage plants. We often sell enough plants among these gardeners and farmers to pay for the entire cost of growing the plants; so that, altho it requires considerable more labor to grow the plants by this method, we are well paid for the trouble. Our method of growing these hardy cabbage plants is as follows:

For the location of the cold frame we choose a place sheltered from the North and West winds. Our cold frames are one foot high in the north side and six inches high on the south. They are built of sufficient width to accommodate the 4 by 6 ft. sash. The soil within is excavated to a depth of about three inches. This space is filled with short, well decayed horse manure. It is not desirable to use fermenting manure as the bottom heat would force the cabbage into too rapid growth. In order to get the manure at a uniform depth we use, a gauge, a 3 by 2-inch timber cut to a length a little short of the inside of the cold frame. A narrow strip is filled in with manure. It is then raked off level with the top of the three inch side of the timber. The gauge is then moved on down the frame, another strip filled in, and so on. After the three inch layer of manure is in the frame it is slightly packed by rolling a board or light plank over it. As soon as this is done we spread on a layer of sandy loam rich in humus. We spread this but two inches deep. Accordingly the timber used in gauging the manure is turned so that the two-inch side is vertical when used for regulating the depth of the soil applied.

In our locality we have found the last week in November to be the best time for sowing the seed. For the early crop we sow seed of the Early Jersey Wakefield. The Copenhagen Market is slightly later but it heads more uniformly and grows heads much larger than Early Jersey Wakefield, so that, in the hands of some growers, it pays quite as well, if not better than Early Jersey Wakefield. We also usually plant a few seed of the Flat Dutch (A late heading variety) so as to have a succession. In sowing the seed we mark out in shallow rows crossing the frame three inches apart, one inch wide and about a third of an inch deep. The seed is scattered along in the rows by hand, using about one ounce of seed under every sash. (Our sashes are 4 feet wide and 6 feet long.) The seed are covered by scraping the soil over them with a light board. After they are covered uniformly from a quarter to a third of an inch the soil is packed slightly over them; and, if it is not quite moist, it is given a light sprinkling of water.

If the early part of the winter is warm it will be necessary to keep the sash raised in order not to force the cabbage plants into too rapid growth. It is not necessary or desirable that they should grow more than large enough to form the third leaf before the first of January. Thruout the winter care must be taken, whenever it becomes necessary to water them, not to apply too much at a time. One is very apt to do this, especially if there comes a bright warm period. But it is better to apply the water in small amounts, and more often if necessary, rather than apply a large quantity and run the risk of losing the plants by "damping off" should a cold rainy period follow.

It is only necessary to give more protection than the sash furnish during the severest cold weather. When the cold frame is made we pile soil up against the sides. This furnishes considerable protection. Then on very cold nights we cover the sash with a very thick layer of hay. This prevents severe freezing unless we have several days of zero weather. At such times quite a crust will form over the surface of the bed. But this will do no harm as long as the bed and the plants are allowed to thaw out gradually. We never uncover the bed so that the direct rays of the sun can strike it while it is frozen. In times of severe snowstorms the bed sometimes remains covered for a week at a time with no injurious effects. It should, however, be uncovered as soon as possible on such occasions, for the heat of the earth, confined by the deep layer of hay and snow, causes the cabbage to make a white tender growth. Then, if it is exposed to a freeze, considerable injury may result.

In early March, when the first warm days of spring come, the sash should be well raised, or removed entirely during the day so as to prevent the plants from making too rapid growth. By the twentieth of March the plants should have made sufficient growth to permit of their being set in the field. Even tho we are unable some years to prepare our ground by that date, the cabbage plants are strong and hardy enough to need no protection whatever from the sash. We remove them from the cabbage frame every year about that date, and use the frames to harden off tomato plants.

We secure from 1,000 to 1,500 plants on an average of these frost proof cabbage, per sash. When set out in the spring they start right off to growing. If there happens to come a heavy frost or even snow after they are set in the field, there is no harm done. They will stop growing as long as the cold spell continues, but they do not lose their tops like tender hot-house grown cabbage under similar circumstances. Furthermore the frost-proof cabbages are all marketed; and the ground, upon which they grew planted to another crop, by the time the tender spring planted cabbage is ready to harvest.—Harris T. Kille, Gloucester Co., N. J.

SMALL FRUITS

The strawberry is the only one of the small fruits that is cultivated extensively in this State. There is a good profit in gooseberries, currants, raspberries, blackberries and dewberries and when properly managed these can be made to yield as well as strawberries. Bulletin 59 of the Michigan Experiment Station at East Lansing, Mich. gives full cultural directions for each of these fruits and the fruit grower would do well to study this bulletin carefully and apply some of its teachings.

Concrete Books Distributed.—As a part of its campaign to improve agricultural methods, the Pennsylvania Railroad is to distribute among the farmers along its lines 10,000 copies of a book describing the possible uses of concrete on the farm. The distribution will be made thru the office of the railroad's Agriculturist.

Cowpeas and Crimson Clover.—Circulars Nos. 27 and 28 of the New Jersey Experiment Station, New Brunswick, N. J., give a very complete outline of the value of these two legumes in farm practice, treating of soil preparation, time of planting, rate of seeding, fertilizers, inoculation methods and varieties as applying to these two crops.

"Proof of the Pudding."—This is the title of a valuable booklet just issued by the B. G. Pratt Co., Dept. A., 50 Church St., New York City. It gives full information concerning Scalecide, its uses and advantages over other sprays for scale insects. The booklet will be sent free upon request to the above address.

Cutaway (CLARK)
Disk Tools for Intensive Tillage
There isn't a farmer in America but who should own at least one CUTAWAY (CLARK) disk harrow or plow.
Over 100 Styles and Sizes
Ask us about the DOUBLE ACTION ENGINE HARROW, the DOUBLE ACTION—REGULAR, the DOUBLE ACTION—EXTENSION HEAD—(for orchard work), the SINGLE ACTION—REGULAR, the SINGLE ACTION—EXTENSION HEAD—(for orchard work), the BUSH AND BOG PLOW, the CORN AND COTTON HARROW, the RIGHT LAP PLOW, the CALIFORNIA ORCHARD PLOW, or the one-horse harrows and cultivators, whichever it may be that you need. Ask your dealer to show you a CUTAWAY (CLARK) machine. Do not accept a substitute. Write us for catalog.

Forage Crops For The Dairy Farm.

First Prize Article, By H. E. Moats, Mercer Co., Pa.

The ordinary home-grown crops, such as corn, wheat, oats, buckwheat, barley, rye, timothy and mixed hay, contain an abundance of carbohydrates and fat, but as a rule are deficient in protein. To balance these feeds and secure as large a flow of milk as possible, dairymen have purchased large quantities of the concentrated protein feeding stuffs. On account of the increased demand, the price for such feeds has advanced in recent years much faster than dairy products, and as a mere matter of business economy it is necessary for the dairy farmers to grow as much protein as possible in their forage crops. I do not believe that it will be advisable to plan to eliminate altogether the purchase of concentrated-protein feeds, but we can certainly grow a much larger proportion on our farms than we are now doing. Fortunately we have a number of such crops to select from, to suit our soil, climate and crop rotation; and these same crops have a two-fold profit of supplying the needed protein and adding to the soil nitrogen, as they are all legumes.

Several years ago I realized that the growing of crops that contained a high percentage of protein was one of the great problems at Maplewood farm both to balance the low protein crops and to increase the nitrogen supply of the soil. At the time clover was becoming a very uncertain crop. We soon found that the use of lime would restore the clovers to their former luxuriousness. Since that time we have been experimenting with several other crops, in the hope that we would be able to find one that would reduce our feeding expense. We have tried alfalfa, cowpeas, soy beans, Canada field peas, vetch, and crimson clover with more or less success.

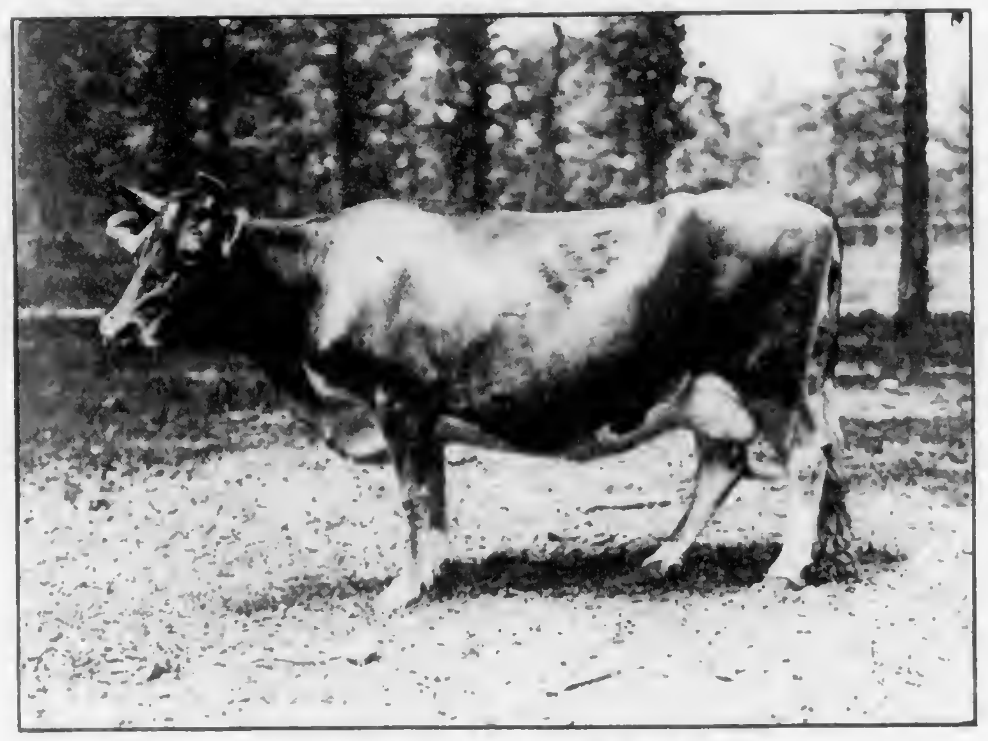
Alfalfa has not been a total failure with us, but it has cost more to grow, ton for ton, than the cost of many of the concentrated feeds on the market. We seem to be too far north to grow crimson clover with any degree of certainty, and the same rule holds good with cowpeas. We are still experimenting with vetch in the hope that it will be a profitable crop.

We have found, after several years of experimenting, that red and alsike clover, field peas and soy beans are the crops best adapted to our soil and climate, both for soiling and winter feed. Without doubt red clover is one of our most valuable protein crops. Where we have supplied the lime to meet the deficiency in the soil, and applied a light coat of stable manure as a top dressing, previous to seeding, we have not had a failure.

Red clover can be produced cheaper for the feeding value than any other protein crop that we have yet tried, with the possible exception of soy beans. While it does not yield as much per acre as alfalfa, yet it will grow much more readily on most soils and is better adapted to a short rotation. As a soiling crop, red clover can be used from about the first of June until killing frosts, except for a short time during the fore part of July, which time can be filled in with Canada field peas and oats. The second crop can be fed as a supplement to green corn and helps to balance the low protein content of the corn plant. Alsike clover is a much surer crop than red clover, as it will pass thru weather conditions which would be detrimental to red clover. Alsike will not yield as much hay per acre as red clover, but the hay is richer and seems to be preferred by all stock.

Canada field peas are best adapted as a soiling crop, but when grown with oats make a hay which is about as rich as clover. The combination is an excellent crop to grow when clover has failed for any reason. Peas are ready to harvest before second-crop clover and soy beans, and at a time when pasture grasses are becoming dry and woody. Peas prefer cool weather and for this reason should be planted as early in the spring as the soil can be worked. They will grow close to the ground unless sown with oats or barley to hold them up and make harvesting easier. A good method of seeding is to drill six pecks of peas, four or five inches deep; then drill an equal amount of oats at the usual depth.

After growing soy beans for several years I am firmly convinced that this crop only needs to become better known to be more extensively grown. It will more nearly solve the protein problem on our dairy farms than any other crop that I know of at the present time. It is not particular in regard to the soil and is suited to all soils that will grow a fair crop of corn. There are a large number of varieties differing from one another in yield of grain and forage, as well as coarseness of stems. We select one or more varieties to suit our needs. Soy beans contain more protein than oil meal, and the cured hay is richer in protein than alfalfa, which easily gives it a lead of all our home-grown feeds.



A TYPEY INDIVIDUAL THAT WILL RESPOND TO WISE FEEDING.

Fifteen to thirty bushels of grain and two or three tons of hay can be obtained per acre, and either grain or hay is greedily eaten by all stock. I believe that soy beans can be harvested more economically when cut and mixed with silage corn in the silo than any other method. But if favorable weather prevails at harvest time, they can be cured for hay. Even after the soys had been allowed to ripen and were exposed to very changeable weather for some time, in order to cure for threshing we were surprised when our cows much preferred this damaged fodder to a good quality of clover hay. We prefer drilling the soys in rows about twenty-eight inches apart, as a heavier crop can generally be secured. They should be planted soon after corn planting time, and need about the same cultivation as corn. Every dairyman should plan to plant some soy beans the coming season, either for hay, soiling or silage, as they will help to reduce the cost for protein feeding stuffs. Where alfalfa will grow well it should be used. Where it will not, use some one or more of the other legumes. Select the crop for your own location.

SECOND PRIZE ARTICLE

Corn and Alfalfa

Corn is King and Alfalfa is Queen when it comes to home-raised dairy feeds. Both of them can be grown successfully and profitably on nearly every farm in eastern United States, and if you have not tried to be the man behind such a throne you have not concerned yourself with raising better forage crops. These crops represent both sides of the balanced ration and if a dairyman was limited to only two feed crops, corn and alfalfa would make more milk than any other two which he could produce.

The fact that the big dairy farms now being established thruout the East always build large silos and plant a large acreage of alfalfa shows what faith they have in this combination. Since they are in a position to know and acquire the most satisfactory feeds it looks as if following their example would be good business.

The Walker-Gordon farm of New Jersey has 300 acres of alfalfa and the managers calculate that last year their alfalfa was worth $10,000 to them. The Wawa Dairy Farm, in Delaware County, Pennsylvania, where they are now milking 120 cows, this year had 85 acres of alfalfa and 160 acres of corn. Mr Henry Steward, the manager, says that if he had to give up these two crops he could not produce milk at a profit.

It is not always necessary to grow a greater variety of crops or increase the cultivated acreage in order to increase the value of home-grown forage crops. Often increasing the yield per acre will solve the problem. If two "blades of grass" are made to grow on a dairy farm where only one grew before, the extra blade will not represent such a problem as the same result would on a grain or truck farm where the questions of storage, marketing and demand have to be considered. Crop rotation always plays an important part in the introduction of new and untried crops, but corn and alfalfa may almost be considered the base of this question. The alfalfa will gather from the air an abundance of nitrogen which is the most expensive fertilizer element to purchase, and the depth to which its roots penetrate puts the ground in an ideal condition for a corn crop.

Mr. John W. Dulles, a dairyman in Chester County, two years ago had a field of alfalfa which he had mowed one year and then considered it too weedy for a maximum crop the second year. He plowed it in the spring for corn. Without applying any fertilizer or manure he produced 89.14 bushels of good corn an acre. It was husked and weighed three weeks after cutting and the yield was computed on the basis of 75 pounds to a bushel. The average height of the fodder was 11 feet. Objection has been raised to alfalfa by some farmers because it keeps them harvesting all summer and the first cutting calls them when the corn needs cultivating. It has been proven a number of times that a ton of alfalfa hay, properly cured, is equal in feeding value to a ton of wheat bran and that a good stand of alfalfa will cut from three to five tons of cured hay in a season. When wheat bran is selling for $30 a ton, as it does now in the East, it is possible to get feed worth $100 from an acre of alfatfa.

To grow alfalfa successfully, three things are essential: Lime, inoculation and drainage. Alfalfa is one of the few plants which refuses to grow without lime. It cannot perform its most important function of gathering nitrogen if the proper bacteria are not in the ground, and it cannot stand wet feet. The secret of success of the irrigated alfalfa in the West is the abundance of lime found there in the ground. There has been no rain to wash it away and when water is brought to the plants they make rapid growth. A deficiency of lime has probably caused more failures with this crop in the East than any other one thing.

One acre out of every three plowed each year in the United States is planted with Indian corn. It will produce more food material to the acre than any other crop which can be grown. Its great value lies at the foundation of this country's material prosperity. Dr. Armsby, by experiments made at Pennsylvania State College, has computed that when corn is fed ruminants only 46 percent of the total energy is lost, while 74 percent of the total energy of mixed hay and 94 percent of the total energy of wheat straw are lost in the process of digestion. For this reason corn meal or corn and cob meal are always used as the basis of a grain ration as they furnish cheapest the largest amount of net energy.

Science tells us also that 63 percent of the digestible food materials present in the corn plant are found in the ears and 37 percent in the stover. The best way to handle the stover so as to obtain the full 37 percent is the big problem in harvesting the corn crop. Where dairying has reached its greatest development within the last 30 years the silo has been the means of getting the greatest value from the corn crop. It conveniently stores with the least amount of labor the cheapest and best form of succulent feed for the winter. Some dry hay must always be fed with silage, and alfalfa hay is ideal for supplying the lack of protein in the silage.

Ex-Governor Hoard, of Wisconsin, figures that he can grow, harvest and put in the silo his corn at the rate of $1 a ton. Two tons of silage will equal the feeding value of one ton of timothy hay. If you think his estimate of cost is too low, you can figure what you can afford to have it cost you in the East where timothy hay sells for $20 a ton. The greatest testimony of farmers who have erected silos is that it enables them to sell hay which before had to go to the cows.

It is not to be understood that silage and alfalfa hay alone will produce milk at a profit. Cows will not consume enough of them to meet the demands of a large milk flow, maintain themselves and nourish an unborn calf. Some concentrates must be purchased. These should be bought on a basis of food value rather than price, and mixed with the home-grown feeds according to standards established by experience. Formulas laid down in Bulletin No. 114 of the Pennsylvania Station are as good as can be obtained. The point is that few successful dairymen can produce all their cow feed, but nearly all dairymen can materially reduce their feed bills by giving especial attention to corn and alfalfa.—Thos. H. Wittkorn, Delaware Co., Pa.

Fertile Farms; near Philadelphia; fruit, poultry, truck, dairy, mild climate, excellent markets. Catalog. W. M. Stevens, Perkasie, Pa.

PLANNING AHEAD FOR THE HERD

An important phase of herd management is to plan the management with reference to the season and conditions. A dairyman with a herd of 25 to 30 cows will find it necessary to replace several of the older cows with heifers or cows from other sources each year. By planning his dairy work so that he can raise six promising calves during the fall and winter when the other activities of the farm are not demanding his attention he will be independent of purchased cows, and the work can be done more cheaply and efficiently than would be the case if he started the calves at various times during the year.

If this method is practiced the calves will be large enough to go out to pasture along in June or July after the grass becomes sufficiently hardened to provide a maintenance ration and by the time his pigs will be large enough to make efficient use of the skim milk and forage crops. By a little thoughtful planning one may regulate the number of calves and pigs fed on the farm so as to profitably utilize the skim-milk, forage crops and waste feeds. He may also plan his breeding operations so that his cows will pay even profits thruout the year. Dry cows, idle equipment and unemployed help are things to be avoided on the well-managed dairy farm.—K.

THE WINTER'S FODDER.

One of the most serious problems for very many farmers to consider just at the present time is how to get the live stock that they wish to winter thru until spring in an economical and thrifty condition on the fodder at hand. In some cases, no doubt, it will be best to dispose of some of the live stock; while in others it may and probably will be best to feed less hay and roughage than has been the usual practice. If there is not enough home-grown grain, purchase other feeds.

This winter feeding of live stock is a question for each farmer to look over carefully and decide for himself as to the best course to pursue. Different circumstances call for different conclusions. It would seem best for each farmer to keep all the live stock that he can feed satisfactorily, as this is by far the most practical method of keeping up the fertility of the farm, a vital question for all farmers to consider. Animals of all kinds are high and not likely to be much lower in the near future, at least; and it is not likely that the old prices will ever return.—F. H. Dow, Steuben Co., N. Y.

FOREST FIRES

Bulletin 117 of the Forest Service Department of Agriculture, Washington, D. C., describes the causes and prevention of forest fires, and also the phenomena of cloudy days, colored rains, etc.

No Vacuum in the Pail
The perfection of the 1914 HINMAN valve chamber makes the Hinman an absolutely noiseless milker. No clicking. The cows stand in perfect contentment. In hundreds of cases the milk flow has been increased where the Hinman is used.

The HINMAN Milker
This new type of valve chamber has visible milk flow; is thoroughly sanitary and easily cleaned—it has positive vacuum control. 2500 cylinders sold in 1913. Every customer claims it is perfection—but the new model is still better

Every Up-to-date Milker Feature
The Hinman milks one cow at a time with each unit. The following are found only in the Hinman: No vacuum in pail; rapid pail changing; no piping—just a simple drive rod; only two moving parts; simple system of keeping record of each cow.

Free Booklet Will Tell You More
It's a genuine text book. If there is any feature of the Hinman you do not understand give us an opportunity of telling you about it. Learn the facts before you buy. 60,000 cows milked daily. Agents everywhere. One is near you

ROUP

During the cold season of the year farmers and poultry-men are apt to be troubled with fall colds and roup in the flocks. Even as early as October, one may find a bird, with a slight cold.

In my opinion, a common cold cannot develop into roup, unless the specific germ is present. The disease must either be on the place, or it must be introduced in some way. For this reason we always exercise great care, when buying stock never placing them with the rest of our flock before quarantining for two weeks to be sure that they are healthy and have no bad habits. We even make it a rule to quarantine our own show stock before placing them with the rest of our flock, so as to prevent the introduction of any contagious diseases, which they may have contracted during their exhibition. Such precaution pays in the end.

In the early stages of roup, the bird will show a thin liquid discharge from nostrils and mouth, frothy or running eyes, swollen head, and offensive breath. In the latter stages it has a very unsightly appearance. Later the secretion instead of remaining fluid, changes to a yellow cheese-like substance, which collects and obstructs the nasal passage, causing difficulty in breathing. The mucous finally collects around the eyes, a false membrane grows over the pupil, and later the entire eye closes up, sometimes one and sometimes both. Of course, all such affected fowls appear sick and listless. In the latter stages the comb turns pale and black and they walk unsteadily.

As already stated roup can usually be traced to some specific source. The germs may be brought from an infected territory by persons, animals, on crates, or thru some other medium of exchange that has taken place.

Roup is prevalent in flocks kept in filthy, damp, poorly-ventilated quarters. Vigorous stock in good surroundings proves quite resistant to the disease.

For the benefit of those who may be interested we recommend the following treatment.

Remove all conditions which tend to foster it; remove all affected birds as soon as discovered. Place them in a clean dry room of even temperature, and free from drafts of air. If you so desire give treatment as soon as earliest symptoms are detected. Disinfect the poultry house and runs with a five percent solution of carbolic acid and repeat this disinfection at least once a week. Feed a well-balanced ration containing some meat scraps. Burn all dead birds. Kill all birds which are past help. One good remedy consists of a few drops of kerosene oil applied to the head of affected fowls. This is also excellent for common colds. Peroxide of hydrogen and water, half and half, or creolin or carbolic acid in 2 percent solution may be used in the same manner. One remedy that as a rule gives excellent results, is a solution of 2 ounces of permanganate of potash in six pints of water. Submerge the fowl's head in it, taking care not to suffocate it. Any of these liquids will help clear the nasal and throat passages and destroy disease germs.

As a preventive dissolve two ounces of permanganate of potash in twelve quarts of water and give to all the birds to drink at least three times a week allowing no other drinking water on these days. Remember, the very best preventive is an abundance of fresh air without drafts, plenty of sunshine and sanitary surroundings and judicious care in guarding against introducing the germ.

Last winter we noticed that several of our hens had developed slight colds. We took them out of the laying house and placed two of them in a warm cellar near a hot air furnace, and two others outside in a large open front coop. In the one place it was warm and dry at all times; in the other it was cold, changing and rather uncomfortable both day and night. Our surprise came about a week later when those in the warm location commenced to get worse; those in the cold place appearing to mend. We carefully watched both sets of birds for the next few weeks. Those in the warm place commenced to get worse, and finally developed a very severe case of roup, and one of them died from this disease. In the meantime the two out in the cold fresh air house, were well on the road to recovery. We placed the one left in the warm place with the two in the cold fresh air house. From the start she appeared to gain, and in the course of a few weeks, one of the three was laying, the other was showing signs of laying, and the sick individual was almost back to normal.

From this experience we make the deduction that fresh air, sunshine and freedom from cold drafts are essentials in the cure of colds and roup in fowls. We would be gratified to have some of the readers of the Pennsylvania Farmer try this and report results.—F. W. Kazmeier, Cornell University.

REMEDY FOR COLDS IN FOWLS

What shall I do for fowls which have colds? Their trouble is not roup as there is no indication of swelling, watery eyes. A kind of hacking cough or a chirping is the principal symptom. I would like to know what to put into their drinking water to help them.—M. G. S., Arcade, N. Y.

A small amount of permanganate of potash is commonly used in the drinking water by many poultrymen for the purpose of curing and preventing colds and probably will do the birds no harm. Personally we do not use drugs on our fowls. It is better to prevent troubles of this kind than to use drugs in an attempt to cure them. If the birds are of that strong, vigorous constitution that comes with a constant effort to keep up the strength and vigor of the flock by selection and breeding and proper environment, there should be little or no trouble from disease, and if slight colds are in evidence in early autumn and winter they usually go away in a few days without any doctoring. Drugs produce an unnatural condition in the animal system and are to be avoided if possible.—J. T. Campbell, Crawford County, Pa.

The Biology of Poultry Keeping.—Maine Agricultural Experiment Station Bulletin No. 214 dealing with "The Biology of Poultry Keeping," is one which should be in the hands of every poultry keeper. It strikes at the heart of the poultry industry, at the features, which are given too little consideration by the average poultry husbandman. Such points as good stock, recognition of individuality, constitutional vigor, inbreeding, housing and feeding are given thoughtful consideration. The bulletin is mailed from Orono, Maine.

Poultry Facts.—Circular No. 40 of the Purdue Experiment Station at Lafayette, Indiana is a report of poultry conditions as the station experts have studied them and an attempt to detail some of the essentials of poultry work and to answer questions commonly arising.

Half a Million
People Are Making Chicken Profits with Johnson's Old Trusty Incubator—This is because the Old Trusty was invented by an engineer who knew chickens. It's made of finest materials in Johnson's own factory where *top notch* results are obtained at *lowest cost*. Huge output, brings the price of Old Trusty within the reach of anyone. Saves you about $5.00.

This Year's Price Based on 100,000 Sales
Write at once for Johnson's price to your station—freight paid. Get started making poultry profits this year. For many years Johnson advertised his price "less than $10"—this year it is still less than $10 delivered east of Rockies. Only a trifle more clear to Pacific Coast. And Johnson ships **promptly**, ready to use.

Mail a Postal NOW
Get the Old Trusty Catalog—read the chicken chapters. Learn about the famous construction of the Old Trusty. Address
Johnson, Incubator Man
Clay Center, Nebr.

Listen to the Cackling Hen
It's a welcome sound to the poultry-keeper. But all hens that cackle are not profitable layers. The laying ability of a hen depends largely upon her anatomical construction? She must be of the "laying type" regardless of the breed. Some hens will lay four times as many eggs per year as other hens of the same breed under exactly the same care and feed.

Keep Only Profitable Fowls
"The Call of the Hen" is a valuable book for every poultry raiser. It is more than a book—it's practically a course of instruction in scientifically selecting and intelligently breeding fowls. Mr. Walter Hogan—the author—gives in this book the results of half a century of careful experimenting in selecting and breeding for heavy egg production. His discoveries show that in every breed there are three distinct types of fowls—the meat, the dual purpose, and the laying type.
"The Call of the Hen" shows you how to pick each profitable layer from the rest of the flock—how to pick for breeders those that will reproduce their laying ability in their progeny.
Send To-Day For This Valuable Book
Mr. Hogan's article on "Prepotency" is alone worth many times the price, $2.00, of "The Call of the Hen." He has absolute proofs that "Prepotency" is the vital factor in breeding and his work verifies his methods and discoveries. Send $2.00 to-day—this is a straight cash offer—no premiums or other inducements—the book will prove in itself the biggest value you ever received.

FORAGE CROPS FOR GROWING PIGS

Farmers and pig growers do not always appreciate the value of green feeds and succulent pastures for their animals. Too often the hog is considered a scavenger and his ability to use waste is regarded as his chief value. However well he serves this purpose, he will pay well for good care, feed and housing.

Forage crops are especially beneficial to young growing animals. It is possible to grow them much more profitably and successfully when a good green field of palatable and nutritious pasturage is provided. Experiments and practical farmers' experiences prove that gains in weight are made at less cost on forage than in the dry lot. Brood sows can be carried thru the season on pasture at less cost than when grain fields are entirely depended upon. Foraging induces the animal to exercise and obtain fresh air, and these prevent diseases being contracted, and when the animals are put in the fattening pen their gains are unusually rapid and profitable. The green feeds eaten are of much value just to keep the pig's digestive system in good condition and the appetite keen.

The entire hog herd can be run on forage crops and will profit by this method of management. Younger animals seem to derive the most benefit, and fattening hogs the least. Herd sows and the herd boar are benefited by having green feeds. It is well to have the sow on pasture at farrowing time, as this is conducive to a strong, healthy litter of pigs. She should be kept on green forage from the time she farrows. The young pigs will soon learn to eat, the exercise and the green food in its natural state will start them along in good condition.

The method of feeding when on pasture will necessarily vary according to the kind of crop used. If the crop grown be rape, alfalfa, clover, cowpeas, soy beans, or other crops high in protein content, the grain ration need not be supplemented by feeds high in protein. If bluegrass, rye, oats, or other non-leguminous crops are grown, it is best to add a small percentage of feeds in protein to the grain. Corn or barley usually furnish the bulk of the grain ration, and when necessary these can be supplemented by adding one-tenth linseed-oil meal or one-sixteenth tankage. The rate of feeding will depend on the gains desired. Considering a full grain ration to be 4 pounds daily per 100 pounds live weight, we may say that for ordinary work with growing shoates a one-half grain ration, or 2 pounds a day for each 100 pounds live weight, will give satisfactory results. If it is desired to make faster gains a heavier grain ration can be used, and if it is desired to maintain the animals as cheaply as possible a smaller percentage should be fed.

It seems doubtful if it ever pays to try to keep pigs on forage crops alone. These crops are sometimes sufficient to keep the pigs growing, but the gains are not usually made economically. Usually the pigs are kept at a loss in live weight. Where brood sows are kept they should be given enough grain to keep them in good thrifty condition. The fact that the forage crops have high value when grains are fed does not mean that they should be fed alone.

Tho crops best adapted to grazing with pigs are alfalfa, rape, clover, bluegrass, bermuda, rye, oats, soy beans, and cowpeas. The nature of the soil, the climate, and the rainfall are influences that should govern the selection of the crops to be used. Alfalfa is the greatest forage crop on soils suited to its growth. Rape and clover are also excellent feeds, and both are high in protein, the element needed to balance ordinary grain feeds.

Farmers are urged to plan some system of forage crops for their hogs. Now is the time to plan some fields to be sown to crops adapted to grazing. If permanent pastures are available, fence off a portion for the pigs and plant some crop to keep the pigs growing when the permanent pastures dry up, and the returns from the year's work with hogs will be proportionately increased. Give the pig an honest chance to make you money by giving him green feeds in their natural state, and his growth, health, and pork-making ability, will be increased.—Dept. of Agriculture Circular.

READY FOR A WORK-OUT ON SNOW ROADS.

A BEEF FAMINE THREATENED

Fresh attention has been called to the threatened beef famine in the United States by the recent gathering of the American Meat Packers' Association in Chicago. Statistics telling strongly of the great falling off in the supply of beef cattle in all parts of this country were presented, and a powerful appeal was made to farmers to engage in the production of beef without delay. The packers were thoroly aroused as to the necessity of raising many more cattle. They looked at the matter in a selfish view as a matter of course, altho this makes not the slightest difference in the telling facts that were given to the country.

One of the packers said that six years ago there was one head of cattle for each man, woman and child in the country, but this year there is only six-tenths of one head of cattle per capita. Attention was called to the fact that unless the beef cattle supply increases materially within the coming few years, the price of beef will rise to figures that are absolutely prohibitive to most people, and porterhouse steak at $1 per pound will not be too high. Frozen meat from Australia is too poor in quality to meet with favor, and Argentine has no large surplus of beef cattle to sell us. It was pointed out that there were 56,000,000 cattle in the country six years ago, where now there are only 36,000,000, and the population has increased 16,000,000 in that time.

The recent course of the market for beef cattle has been strongly upward, and every indication is that much higher prices will be paid before the advance finally culminates. In the Chicago market, beef steers have been selling within a few days at $7.15 to $9.50, with the greater part going for $8.25 to $9.25, and the top price is highest paid since last January. Last year saw record prices, with the best steers fetching $11.25, and it is not at all unlikely that this price will be repeated this year. Stockers and feeders are joining in the upward movement of prices, as well as butchering, canning and other stock, and the best feeders are up to $8.15. Calves are extremely scarce and up to $12.10, farmers having started in to retain calves with beef blood for rearing, and it is a good sign that they are also holding back their good breeding cows and heifers.

A demand for stockers and feeders is springing up in various quarters, and in the West and Northwest, owners of thin steers are holding for finishing. Northern Iowa, Minnesota and the Dakotas are going to do a good deal of feeding the coming winter, as is Wisconsin. Roughage promises to be abundant and will be utilized largely, while a good deal of corn will be used, despite its dearness because of the short crop this year.—Wilmot W. Foote, Chicago Market Reporter.

FOR PROFIT, NOT PLEASURE

According to wrapper on my paper it does not expire until January 15, but am sending herewith stamps for 50 cents for renewal of same when due. I don't want to miss any numbers. I take two other papers but as I have said before your paper seems best suited for this section for those who are farming for profit rather than pleasure.—A. W. Wallis, Longwoods, Md.

Stockmen, Attention!
Medicated Stock Salt, the great worm destroyer, at a reasonable price. We will ship you a supply sufficient to feed your stock for 30 days and if you are not satisfied that it does all we claim that it will do, it will not cost you one cent. If you are pleased with the result, then I say we charge you a reasonable price. We undersell all competitors, and give you a better product, one that costs more to make than does any other make on the market. We are going to give our customers a fair deal, and in return we expect a square deal. If our salts are satisfactory to you, we even deduct the freight from your bill, but you pay the freight when you get the salt, but the freight is all you pay when the shipment arrives.
We say our **Medicated Salt** will rid your stock of worms, keep them in the pink of condition. Your colts should have it all the time, your sheep will thrive when fed it, and no wormy hogs when fed our special hog salts. We guarantee this, if our **Medicated Salt** fails then you do not pay one cent. Send your order to-day, and we will make immediate shipment.
Prices 125 lbs., $5.00, 200 lbs., $8.00, 300 lbs., $11.25; 500 lbs., $18.00; 1000 lbs., $30.00, Ton, $45.

Forage Feeds Sometime ago we announced a series of prizes for best articles on forage crops for dairy farms. Two prize articles are published on another page of this issue. As one writer says, the growing of the richest possible forage crops adaptable to local soil and climatic conditions is a matter of business economy to the dairyman. The manufacturer usually plans on buying his raw materials, but it would be suicidal for him to buy materials in his business operations which he could produce more cheaply in his own plant. The successful dairy farmer, who secures maximum results from his herd and equipment must buy some concentrated or commercial feeds; but it is poor economy for him to buy what he can produce more cheaply on his own farm. Yet this is just what many are doing. Because of the ease with which timothy can be grown, and because of the high market prices which can be secured for the surplus which may be available for sale, this grass, which is one of the very poorest in point of dairy feeding quality, is made the basis of the forage ration. The various, rich leguminous plants, including the clovers, alfalfa, soy beans, cowpeas, etc., are a little more difficult to grow in some localities, but some of them will produce profitably in any location in the East, and will return enough more food value than timothy to pay for the extra time and work in growing them. And they have the double value of adding to the fertility of the soil while contributing to the food value of the farm forage. The problem for the dairyman is to ascertain which of these crops will yield most abundantly and profitably under his local conditions, and then bring them into his rotation. Like the Mercer County dairyman, some farmers will find some of these legumes costing more to produce, pound for pound, than some of the concentrated feeds on the market. Selection must be made upon the basis of comparative costs and values. It is a profitable field for careful study and observation. The same is true in the selection of commercial or concentrated feeds to supplement the home-grown feeds. Buy on the basis of food value rather than price. Economy in feeds, whether grown on the farm or purchased upon the market, depends upon what they will produce in dairy products, as well as upon price.

Price Cuts in Woolens Reports from the wholesale woolen goods dealers announced on January 13 that there are to be material reductions in the wholesale prices of staple serges, unfinished worsted, clays, cheviots and other woolens for the fall of 1914. The cut in price was announced as being a direct result of the new tariff schedules and the anticipated competition from abroad. Present prices on these goods are considerably below those of last fall, certain grades of serges showing a reduction of 23 percent. With the additional reduction promised for the coming season, there should be ample reason for substantial cuts in prices of clothing, the form in which consumers are interested. That such a reduction will result, however, is extremely doubtful at this time. The general opinion reported among wholesalers is that the expected benefit to consumers due to reduced prices will be lost in the course of "handling." This is the acid test of the wool tariff. The sacrifice of the wool growing industry thru the placing of wool on the free list may be justifiable if it can be shown that commensurate benefits result to the consuming public. But there is no justice in the sacrifice of an important industry for the benefit of the manufacturers, jobbers and retailers who make up the body of "handlers." The trend of prices from the wool growers to the final consumer will be watched with interest during the next twelve months. It will reveal much that is not now entirely plain in the working of our tariff system.

Maryland Agricultural College. A matter of very great importance to Maryland agriculture which must be met in the present session of the state legislature is the rebuilding of the State Agricultural College. The state now has the opportunity to put that institution upon a firm basis of absolute state ownership and control. Because of its location, in close proximity to the U. S. Department of Agriculture, and because of the diversity of rich agricultural interests of the state, this institution ought to be one of the leading agricultural colleges of the country. It needs only to be cut off from all semblance of private ownership and given a stable program of state support. A feasible plan for the latter has been developed by President Patterson, under the annual instalment plan, and if the farmers of the state will give this plan the support it deserves, they will not only put their college upon its feet, but give other states a valuable object lesson in safe and stable financing of educational institutions. President Patterson proposes an appropriation of $1,000,000, to be given to the college in five equal annual instalments of $200,000, and a yearly maintenance fund of $50,000 for the first year and increasing thereafter at the rate of $10,000 a year until it reaches the sum of $100,000. This provides for the very thing that is most lacking in the educational institutions of the East—a stated amount to care for yearly expansion and a graduated maintenance fund to provide means for best use of the growing institution. The plan is sound so far as the needs of the institution are concerned, and permits of a taxation system for support which shall levy upon the increased agricultural wealth which the college is able to produce. The legislature is now in session and the Governor has declared his position as favorable to the college and experiment station, and every Maryland farmer should rally to the support of President Patterson's program.

Shoe Prices It has become a habit with many to class only the farm-grown products among the necessities which contribute to the high cost of living. The rich, and even the so-called middle classes, make slight objections to the prices of theatre tickets, taxicab hire or wearing apparel; but they stand ready to boycott eggs, butter and meat when prices rise above the level of preceding years. Many of the theorists who are loudest in their denunciation of high prices of food products overlook the fact that practically all of the articles which farmers must buy are steadily advancing and are maintaining if not exceeding their relative position with farm produce of a few years ago. A striking example is found in the matter of shoes. The $2.50 and $3 shoes of a few years ago are gone with the 50-cent wheat and 20-cent butter. Good shoes now range from $4 up, and the end is not yet. At the National Shoe Retailers' Association meeting, which closed at New York City on January 13, it was predicted that the retail price of shoes may soon reach $10 a pair. As hides were placed on the free list a few years ago, the tariff could not be urged as the cause of the soaring prices. Instead, "pure shoe laws" were assigned as the reason. Twenty-five states in the Union now have laws requiring shoes not made entirely of leather to be stamped as "adulterated," or as made of "substitute leather," and this was urged as the cause of prices doubling and trebling in the last few years. It was asserted that if all shoes were made of all leather, 2,000,000 more hides per annum would be required in this country alone, and with hides practically in control of the larger packing houses it cannot be foreseen to what heights shoe prices may soar.

NEW JERSEY FARM NEWS

State Veterinarians Meet.—The annual meeting of the New Jersey State Veterinary Association was held at Trenton. Dr. Thomas E. Smith, of Jersey City, was elected president. In his speech of acceptance, Dr. Smith told of the work accomplished during the past year and suggested issues for the future. He cited that the ideals and ambitions of organization were not alone for personal gain, but for the general good of the stock raising industry thruout the State. Interesting papers were read and a committee was appointed that will endeavor to obtain State legislation controlling animal diseases.

Concerning Foods, Etc.—More specific legislation with respect to the sale of adulterated and imitation lard is urged by the State board of health. Members of the board also state that the cold storage act, which passed in 1911, is defective in a number of particulars, and should be amended. Warehouse men should be required to submit reports of the goods held in storage monthly instead of quarterly, as not sufficient information is secured regarding the amount and kinds of goods which are held in storage from the quarterly report. The law should also be changed as to require the marking of foods with the date they are released from storage, as well as the date of entrance into storage, and there should be further provision requiring that all goods which have been in cold storage be so marked when offered for sale.

Meat Inspection.—There is no system of meat inspection in force in this state and large numbers of animals are slaughtered annually, a considerable proportion of which are diseased and which receive no attention whatever. This is a condition which should not exist and legislative action is required which will result in some method of supervising the slaughtering of animals for food. It is also recommended that legislation be enacted to prevent the use of coloring materials and preservatives in meat and meat products, and to define the terms "blend", "mixture" and "compound." At present much confusion exists as to the exact meaning of the words.

Tire Tax.—The farmers of this state are opposed almost to a man to the recommendation of State Road Commissioner Stevens, that all wagons pay a tire tax to the State. They are also unanimously opposed to automobile reciprocity, knowing as they do how foreign cars tear up the roads. Many organizations of farmers have already gone on record as favoring the repeal of this feature of the automobile law and against any proposition which would impose a tire tax; or a tax on the wagons of a farmer, aside from automobiles. This tax would certainly be wrong, for on the average a farmer has something like fifteen wagons, counting his farming implements. To tax them for road driving would be double taxation, hence manifestly unfair, for such vehicles do not tear up nor wear down the roads.

School Laws Again.—The farmers are now preparing to wage the fight in the Legislature for more complete control of the moneys raised and spent by them for public schools. The farmers are opposed to some of the methods of the State board of education, whereby schoolhouses are condemned, forcing the erection of new ones, with consequent boosting of tax rates, and the abandoning of some district schoolhouses, and the consequent grouping of children for daily transportation. Because of this approaching fight in the Legislature arising from planks in both the Democratic and Republican State platforms, which would curb the power of the State school board over condemnation of school buildings unless a majority of taxpayers agree on the proposition, there is much interest in educational movements just now in the rural counties.

The Question of Farm Surveys.—At the annual meeting of the Mercer County Farm Bureau, the question of farm surveys was presented by Prof. L. A. Clinton, one of the experts of the national government. This question of farm surveys is one which, in the last few years, has received a great deal of attention. Survey bulletins have been issued by some of the State experiment stations, notably New York, and by the U. S. Department of Agriculture. These surveys, wherever taken, have shown that there are four factors in profitable farming. The first factor is the size of business. No farmer can hope to make a net labor income of over $1,000 and up, exclusive of the interest on his investment unless he conducts a total business which is in amount above the average. There is not enough room for profit in a small amount of business. The second factor is diversity of business. The most successful farmers have several important sources of income. This not only puts eggs in several baskets but helps an equal distribution of labor thruout the year. The third factor is the quality of animals kept on the farm, and the receipts per cow on dairy farms. Poor cows are keeping farmers poor. As one farm survey puts it a farmer must get from his cows one and one-half times more than the average labor income of about $1,200 a year. The fourth important factor is the crop yield. It pays to grow good crops, but most surveys have developed this as the least important factor of the four. These factors have been likened to the links in a chain, the weight supported by the chain, the labor income. The chain is no stronger than its weakest link. Four-fifths of the farms in these surveys are below the average in one or more of these four factors. Most farm systems have links that need strengthening. If a farm business is as good as the average in all of these factors the labor income will be above the average.

State Experiment Station.—While much of the work at the State experiment station has been retarded, particularly in animal husbandry, because of the fire that destroyed the barns last July, much has been accomplished during the past year in other branches of agricultural experiment work. The income during the fiscal year that ended October 31, was as follows: State appropriation, $94,041.96; United States appropriation, under the Hatch act, $15,000, under the Adams act, $15,000; receipts from the sale of farm produce, $673.89; total, $124,715.85. An itemized list of expenditures has not been made public. This statement is a pretty good answer to those who have been clamoring for more money for the agricultural interest of the state. This year the College, Station and Board of Agriculture are to get over $230,000 from the State as well as the $30,000 from the national government. Work at the Station included studies in soil chemistry, bacteriology, plant breeding, peach breeding, poultry husbandry, oyster

propagation and studies on methods for the extermination of pests, such as the plum curculio and root maggots. Apiary instruction work was organized as provided by state law. Six bulletins, setting forth the results of some of the more important investigations, were published and distributed. Director Lipman states that the affairs of the Station are generally in a good condition and an effort to strengthen the work and to enlarge its scope is in evidence. The State appropriation for building will give the Station as well as the College much better facilities.

State College Notes.—The students in the junior class at the State college made a two-day visit to the National Poultry Show which was recently held at Madison Square Garden, New York City. Every opportunity was given by the officials of the show to make a thoro study of the various breeds of birds. The senior agricultural students made a trip thru the State colleges and universities of the Middle West during the Christmas vacation. A study was made of the equipment, apparatus and methods of teaching at each of the institutions. Special lectures and demonstrations were given for the benefit of the visitors. Those who made the trip say Western colleges are ahead of the East in farming methods but not in fruit growing or poultry raising.

After Heavy Autos—State Motor Vehicle Commissioner Lippincott has prepared a bill which will be introduced in the Legislature early in the session. This act will empower the commissioner to license auto busses and motor freight busses, but will expressly provide that he shall license no machine which in his judgment would be unduly injurious to the roads or dangerous to other traffic. License fees will be increased and the funds so collected shall return to the counties for the repair of roads on a per mileage basis, in accordance with the mileage traveled within the boundary of the county.

Dairy Inspections.—The bureau of creameries and dairies made 585 inspections last month. The production of milk was prohibited in three dairies and the dairymen were ordered to appear before the board to show why they should not be closed because of failure to meet requirements. Eighteen dairymen were notified to improve their methods within a specified time.

The Burlington County Exchange.—The Burlington County Farmers' Exchange during the year just closed marketed 252,325 bushels of potatoes amounting to $142,441.46; 44,394 packages of farm truck at $59,880.34; and 6,380 crates of fruit, amounting to $18,438.85. The total receipts for the year were $276,347.87, and expenditures were $253,410.14, leaving a gross profit of $22,937.73. The Exchange has a membership of 867.

Freight Rates and Living Cost.—In an address during the recent Farmers' Week at the State College, George D. Ogden, general freight agent of the Pennsylvania Railroad, produced figures designed to show the average freight charge which is paid on the portions of food sufficient for one meal for a family of five persons. He estimated that on a large and varied meal, for five persons, the raw material for which would cost approximately $2.00, the freight charge would amount to about eight cents. He also stated that one cent would pay the freight respectively upon enough apples for eight meals, enough beef for one meal, enough cabbage for four meals, milk for two meals, onions for 1 1-3 meals, oysters for three, potatoes for two meals, canned tomatoes for three meals, fresh tomatoes for two meals and turnips for 14 meals, all for a family of five persons. This estimate may be all right, but when a crate of tomatoes sells for 50 cents, and there are 10 cents deducted for freight, 5 for cartage and 5 for commission, there remains but 30 cents for the farmers. The plants to produce that crate cost another 5 cents. If the crate, worth 15 cents be lost or destroyed, the grower has just 10 cents left for the use of land, fertilizers and labor. Also, if it is worth 5 cents to cart a crate of tomatoes in the city, why not in the country where the haul is more often longer? In that case, 5 cents will have to cover the entire cost of production. Still the railroads, commission men and retailer will tell you that the farmer who can produce 1,000 crates of tomatoes to the acre and sell them for 50 cents a crate is getting rich fast. Well, if 1,000 crates net 5 cents a crate, that's $50 an acre. It will take that much stable manure, fertilizer and nitrate of soda to produce the 1,000 crates. What have we farmers left for the land and our labor? Leaving us and the railroads out, it is no wonder that the municipal market in Newark showed a net profit in 1913 of $23,390.74 out of total receipts of $59,722.67.—D. T. Hendrickson.

NEW YORK LETTER

Conservation Commission.—The annual report of the conservation commission has just been submitted to the legislature. The total receipts of the department for the fiscal year were $316,407.87 as against $256,002.84 for the previous year. Hunters' licenses contributed largely to the increase, these amounting to $161,490. It is believed that this item will reach $200,000 next year. The revenue of the fish hatcheries and state game farm amounted to over $300,000. Add to this the departmental revenues turned into state treasury during the same fiscal year which were $316,407.87 and we have a total, indirect revenue or its equivalent, of $617,007.87. The total appropriations for this department were $658,126.66. Total expenditures for the fiscal year were $744,103.

State Agricultural Society.—The state agricultural society is holding its annual meeting this week at Albany in connection with the state department of agriculture. Important reports will be presented by committees appointed a year ago. Agricultural Credits will be discussed by R. B. Van Cortlandt of New York; an eastern Produce Exchange will be described by Seth Bush of Morton; Ezra Tuttle, of Eastport, will tell about the co-operative work of the state grange; Mrs. Julian Heath discusses Housewives' problems; Hon. Marc W. Cole describes the work of the State Bureau of Co-operation; Hon. J. N. Carlisle tells about the kind of roads the farmer needs; Prof. Tuck gives an account of the agriculture of the far East; County Farm Bureaus are explained by M. C. Burritt, head of the Farm Bureau Department of the State; Dr. Finnegan of the Educational Department tells what should be done to improve our rural schools; Dean Cook agrues for a unification of our agricultural forces and the final session will be addressed by Gov. Glynn, Commissioner Huson and Chancellor Day.

Gov. Glynn and The Farmers.—Gov. Glynn has had in consultation this week several prominent agriculturists and they have gone over two or three important agricultural question with reference to some new legislation particularly with reference to farm credits. One of the things proposed is to establish a land bank with which shall be co-ordinated about 250 savings and loan associations for the administration of the functions of the proposed system. The land bank is intended to be a sort of clearing house for mortgages on farms. It is also proposed to create a market commission which shall act as an agent between producer and consumer. The matter of amending the commission merchants' law so as to allow the Commissioner of Agriculture the right to examine the books of commission men was also considered.

High Priced Holstein.—At the sale of Holsteins this week at Syracuse a young bull, Spring Farm Pontine Cornucopia, brought $15,000 and a six weeks' old bull calf $2,025, while a six weeks' old heifer calf sold for $900.

Farmers' Week At Canton.—This will be from January 26 to 31, and the sessions will be held at the school of agriculture. January 27 will be devoted to the interest of the Holstein breeders of the northern section of the state, Wednesday, January 28 will be in charge of the corn growers, January 29 will be devoted to the Farm Bureau and it is also Womans' day. January 30 is for the Press, the development league and business men.

Dairymans' League.—A branch of the Dairymans' League has been organized at Cooperstown with Geo. H. More, president; Howard Clark, secretary and J. E. Shepherd, treasurer.

Grange Co-operation.—There are 20 granges in Jefferson County that are identified with the Patrons' co-operative Association. Considerable money has been saved the past year to members of the association by buying supplies for the farm together. The president of the association is O. E. Hinds, of Watertown and B. A. Field, of the same city, is secretary.

Farmers' Week At Morrisville.—The fourth annual Farmers' Week exercises are in progress this week at Morrisville at the State College of Agriculture. The session closed Friday with the annual trophy debate by students of the college.

Money Wanted.—The several Farm Bureaus of the state are interested in securing another appropriation of $25,000 from the state this winter for Farm Bureau work. This amount was appropriated last year but some of it went to the establishment of a new department at Albany and for other purposes.—D.

MARYLAND NOTES

Gunpowder Club Meeting.—At the last meeting of Junior Gunpowder Agricultural Club at the home of Mr. Granville Mathews, Baltimore Co., many topics of interest were discussed. Mr. Mathews, who raises alfalfa, corn and hay for market, claims that blue grass which came up thick in his alfalfa, in combination with the alfalfa makes a splendid stock feed, cows being particularly fond of it. Mr. Mathews feeds a number of steers every winter which he declares is a most convenient way to market the crops grown on the farm, and also serves as a most excellent plan to maintain soil fertility. Discussing the best ration for young pigs in conjunction with skim-milk it was the opinion of members that ground corn was best as the pigs do not properly digest the whole corn. A member, who has been experimenting, said he preferred wheat and corn ground together, as too much corn often causes trouble, indigestion and loose bowels.

Harford County Organizations.—The Upper Cross Roads Farmers' Club recently met at Mr. H. Ashton's farm and a full attendance of members was recorded. The inspection committee among the many products specified, reported 500 bushels of potatoes, and a new orchard of 130 trees, and a new garage. The last named is evidence that the Harford farmers are "getting there" in good style.

At the last meeing of Fallston Farmers' Club at the home of Mr. James O. Watson, which is one of the oldest farm homes in the county, the house having been built in 1794, the members seemed to be more interested in the wainscotting and pannelling of the colonial architecture than anything else. The inspection, however, made a good report of the farm and crops. Mr. Watson follows a system of selling cream and feeding the milk to his stock. Members advised lessening acreage and doing more intensive farming. Mrs. Charles S. Ramply, of Long Green, is the champion turkey raiser of the county. From two hens last year she raised 71, and received for 69 of them $242. The largest one dressed 21½ pounds for which she received $6.88. Quite a nice lot of pin "money" to realize on the farm about holiday time. If one woman can do it, others also can.

Kent County Interests.—Over 100 farmers and owners of traction engines fron Kent, Queen Annes and Talbot counties recently met at Chestertown and organized a protection association. Resolutions were passed protesting against the present State Road laws which prohibit traction engines from using state roads. This law the past season caused many farmers great inconveniences in getting grain threshed, and now many have sold their corn and cannot get it shelled. The large cowbarns of H. H. Pearson, Rich Neck Manor were recently destroyed by fire. Mr. Pearson was formerly of Philadelphia, and bought the celebrated farm from General Seth with no previous experience. Mr. Pearson studied farming and today his farms are not only among the cleanest and more thoroly tilled, but the crop yields equal any in the state.

Tobacco Situation.—The tobacco growers of Southern Maryland fear that owing to the faulty packing of their products before sending to Baltimore market, and the alleged inefficient manner in which it is inspected, that the tobacco trade of Germany, Holland and France which they have profitably enjoyed for many years will be lost. The growers declare the inspectors are politicians who have little knowledge about tobacco.

COUNTY NOTES

Clinton Co., N. Y., (N.E.) January 5.—Weather fine. Sleighing and cold and dry. At recent auctions cows not selling as well as expected. Veals, 9c live for good ones. Horses not in demand and almost a drug. Much plowing done during the late fall and all work in good shape. Some filling ice houses.—Henry E. Gilbert.

Carbon Co., Pa., (E.C.) January 5.—Weather unusually mild during December. Snow fell day after Christmas, making good sleighing ever since. Potatoes were an average crop, and are now wholesaling at 80c delivered, with quite a few growers holding for higher prices. Owing to the open weather, which continued up to Christmas day, more plowing has been done than for many years previous.—Brice Brenckman.

Morris Co., N. J., (N.) January 7.—Weather clear. Snow on ground. Poor sleighing. Cattle, horses and hogs are wintering well on account of mild weather. Winter wheat and rye are looking fine. Good farm work horses are scarce and high. Butter 35c; eggs 40c. Very little work being done now on account of snow. Taking care of stock and hauling summer supply of fire wood is the main occupation.—Geo. F. Williamson.

LEGAL DEPARTMENT

Thru this department Pennsylvania Farmer will discuss general legal queries submitted to it by its readers. Questions involving unusual circumstances and of purely local or special nature can not be handled. This department is open to the free use of readers.

Road Taxes—Wide Tire Wagons.—Will you kindly give the provisions of the Pennsylvania Road Law regulating the use of wide tire wagons? Is there a percentage of taxes deducted for the use of wagons on the road having tires of four inches wide or wider? J. E., Mendville, Pa.—A person who uses exclusively, in hauling loads of two thousand pounds weight and over, draft wagons with tires not less than four inches in width, is entitled to a deduction of one-fourth of his road tax for the succeeding year. To obtain this deduction such persons must subscribe to an affidavit stating that he has used such wagons. The oath to this affidavit may be administered by the supervisor of roads and should be filed with him. A person who uses only draft wagons equipped with four inch tires in hauling loads of two thousand pounds or more is entitled to this rebate tho he uses wagons having narrower tires to haul less loads. Any person who uses wagons having tires less than four inches in width in hauling loads of ten thousand pounds weight and upwards is liable to a fine of five dollars for each offense.—G. G. and H.

Intestate Law—Widow's Interest.—A inherits real estate, marries B and dies, leaving no children and no will. A and B have purchased real estate. What are B's rights?—Subscriber, Bucks County.—Where a man dies without making a will, leaving a widow but no children, the widow is entitled to one-half of the real estate for her life. If the statement that A and B had purchased other real estate means that the title was taken by A and B jointly then the husband and wife became tenants by entirety and the widow, upon surviving her husband, becomes entitled to the said real estate absolutely. If, however, the real estate was conveyed to the husband alone, the widow will only have the one-half dower interest. In addition to the aforesaid dower interest, the widow may claim five thousand dollars absolutely, which she may elect to take out of the remaining real estate, or out of the personal property. If this is an actual state of affairs, it would be advisable to consult an attorney in order to protect the interest of the widow.—G. G.

Water Rights—Drainage.—A and B own adjoining farms. Can B compel A to build a ditch to prevent water from his farm running into a ditch on B's farm? Chester County Reader.—The owner of lower land cannot prevent the natural flow of water upon his land from higher adjoining land. If A's farm drains naturally into B's ditch, B cannot compel A to build a ditch to divert the natural flow.—G. G. and H.

Roof of Quality.—A catalog of unusual value to anyone contemplating the purchase of roofing material, either for a new building or re-roofing an old building is issued by The Dickelman Mfg. Co., Dept. 40, Forest, O. It describes and illustrates the many special features of the famous Dickelman Extra Open Hearth Galvanized Roofing. The catalog will be sent free upon request to the above address.

Your Bargain Book.—The Charles William Stores new 1,100-page, money-saving catalog is a revelation in high-grade merchandise at surprisingly low figures. It lists everything for the family, home and farm, which is sold on a straight prepaid guarantee basis. The catalog will be sent free to any of our readers who will send a postal card request to The Charles William Stores, 1015 Stores Building, 115 East 23rd St., New York City.

How to Get Better Roads.

Earth Roads Improved by Use of King Drag.

By Dr. DONALD McCASKEY.

Keeping The Roadside Gutters Open

Everything is easier and better if always done right and at once. This can never apply more emphatically than in the maintenance of drainage ditches of township roadways. If you want to keep the road which runs by your own farm or close to your own house in good condition you must keep the water out of the middle of the road; keep it where it belongs, in the side gutters. Get out with your plow and start a good deep furrow close to the fence. Run this furrow along the road, parallel to what ought to be the road crown. The best time to do this is in the fall. The sod will rot during the winter, and if the furrow is thrown up against the bank, the road's drainage ditches will be able to handle a good deal of water which formerly ran down the middle of the road.

But the plow is not enough. The road grader and the road drag have a very necessary place in opening up a drainage ditch. Suppose you wanted to compel the waste water to run off the road's center and run into the side ditches, but because of neglect there are no properly opened ditches on the sides of the road. First plow, then follow up with the road grader. Sink the blade in deeply, cutting away at least one foot of clogged side ditch. This loose earth should not be pulled out in the middle of the road at one time. It should rather be dragged out with the use of the road drag over a period of several draggings. I am speaking, of course, of open weather work. It is not necessary or advisable to always wait until spring. You can get on the road at anytime during the year when the ground is soft.

In operating the blade of the grader, drive the cutting point down deep the first round. During the second round the edge of the blade can be put down only a few inches. This will shave off a big slice of the earth at the berm. This slice belongs in the center of the road instead of at its berm, or that section of the road at the junction of the side gutters and the road foundation proper. This must always be a few inches lower than the high point of the crown at the centre of the roadway. Four of five rounds with the road grader will do a lot of good work. Every other round the point should be sunk in deeper. Every alternate round the cutting edge of the blade should be put down a little more to shave some more off the berm.

Of course the man who operates the scraper blade will have many varieties of conditions to contend with. He may strike solid rock, which blocks the side gutters. The old custom was to merely lift the blade of the scraper and pass this blockade by. This is not good business. Whenever a side ditch is blockaded, the rock must be blasted out. It is impossible to make a road grader do its best work if rocks are permitted to remain. The function of a road grader is to open up the water courses. When a little dynamite is needed to supplement the cutting steel of the grader blade, the dynamite should be promptly and freely used.

When the grader has made four or five rounds, the drag can often be put to work to level out the earth pulled up and shaved down by the grader. There is no hard and fast rule to govern this procedure. The main idea is to have the slope of the road not less than one-half a foot in its drop from the height of its center. Engineers will have varying figures. Oftentimes roads need different slopes but be sure that you have at least six inches of drop from the crown to sluiceway. Then water will not attempt to run up hill. The water readily runs into the side ditches if it is given half a chance.

Of course there are all types of road graders. Every dealer will tell you that his particular grader is the best. Many inducements will be offered to township officials to buy a particular kind. For instance, in one township I know of the three officials of the township took a trip to Indiana in search of a road grader as guests of the company. Whether they got the best grader or not will depend in great measure upon the intelligence of the man who operates the blade. The average grader is big and clumsy and cannot be turned in a short space and usually requires a team of six horses. If it is to be used in mid-summer, as in May or July, or during the fall, I have found that traction engine power works better than horse power. The traction engine can pull more steadily and you can procure a more even degree of cutting in your work. Personally I much prefer traction power to horses.

Another menace to maintaining a clear open waterway is grass. Weeds and brush need to be attended to regularly. These are removed in grading and the constant dragging during the later months of the spring and summer will usually prevent grass, weeds or brush interfering. During the summer months, when the grass along the fences grows high it should be cut and removed or burned and not be permitted to obstruct the ditches. If it is left where cut a goodly amount of dust mixes with it and the mass serves to act as an obstruction to the road's drainage. There is a law on the statute books I have been told (among the mass of odd and mixed up road laws of Pennsylvania) which says that the width of a road extends from fence to fence. If this is the case, any farmer who would deliberately fill the water courses with obstructive waste would be legally liable to prosecution. But I do not think this is the efficient way to solve this problem. The quickest way is to have road patrolmen placed in charge of specified road sections. It is then the business of these men to keep their water courses open, to keep down all the grass, weeds and brush along the wayside, and to maintain a wide-open and clean condition of the side gutters all the year round.

There is a light handy grader for use in cleaning out side ditches. It cannot do the same work as the heavier grading machine but in its sphere it does wonderful work. All are good if properly used. The trouble is that they are usually brought out only once a year after corn planting, when it best suits the farmers to "work the roads," whereas were the road's side ditches opened up nicely all the year round, using the pick, shovel, dynamite, the grader and the road drag patrol, our local highways would spell boulevards instead of mud holes and ruts.

It would be a fine plan to interest and instruct the school children of each township by giving practical lessons in earth road making and maintenance. It would certainly be more practical to teach modern road making than the history of the much lauded Roman roads. There is too much dead stuff in our school curriculums as it is. Why not inject a little life which will reflect itself in township affairs by starting with the children in road making. There is no reason why a practical course of instruction in keeping a road's side ditches open and the road in repair should not be considered "study" and "education" and schooling, just the same as the prescribed text book studies. Schooling does not consist in mere book study. Just here is an opportunity for the State Highway Department. It should have regular schools in every county to which our public road officials and others could go for practical demonstrations. Such a practical plan would arouse interest in the road problems and greater attention to road maintenance. Our townships need more than money to get roads adequately built. They need to have every one of their farmers and farmers' wives, their township ministers and doctors and the school children themselves to understand the general principles of road building and maintenance.

I am a strong believer in having the township road officials take the public into their confidence when it comes to treating road problems. Likewise the public should keep in touch with the road officials, and when they fail to act, our township citizens should go ahead and fix things themselves, keeping of course within the spirit and the provisions of the law. This is the quickest and most effective method; it is likewise the simplest and cheapest medicine to apply to road diseases. In a recent issue of a Philadelphia daily there appeared a rather caustic stricture on the good common sense of the farmers of Pennsylvania. The article was written by the Automobile Editor. He said: "The tide of good roads enthusiasm is constantly rising, despite the fact that the people of this state at the last election defeated a measure aimed at the time of its origin to improve the roads for the benefit of the citizens of the Commonwealth. The farmers of Pennsylvania defeated this bill."

I wondered as I read whether the Editor realized that our state assembly had deliberately failed to pay the farmers who defeated the road loan its legal obligations in road appropriations. I wondered what he would have thought of his paper if he had contracted to do a certain piece of work for it as Automobile Editor and then had the paper fail to make good on its end of the obligation after he had lived up to his part of the contract. Wouldn't he have "jacked" the job? Wouldn't he have lost his respect for the promises of his paper's management? There has been no public action of the Pennsylvania farmers more significant of their better organization than this defeat by a 41,000 majority of the $50,000,000. road loan.

In the great meeting of the American Road Builders' Convention which lasted a week, recently, in Philadelphia, the majority of the discussions and highly scientific papers dealt with the higher priced, ultra-scientific roadways. This type of road is very necessary. The study of road materials is also very essential. But, among all those speakers at the four-day convention, the one whose message carried farthest to the American people as a whole was that of "Old Shack," commonly known as "The Knight of the Dirt Road." He was Congressman D. W. Shackleford, of Missouri, who declared for "plain roads for plain people." Mr. Shackleford has the right idea when he says: "Build the local roads first, then if we have any money, we'll fix the boulevards.' The local roads belong to the everyday farmers comprising our township population. It is perfectly safe to place the problem of proper drainage under the responsible care of the local farmers if the proper system of patrol, inspection and pay is inaugurated. Then, and not until then, will there be a universal state-wide attention given to the essential subject of building, draining and maintaining the country earth roads.

Mitchell Little Six
$1895.00

Recognizing the fact that the modern farmer is as much of a *business man* as the merchant of the big commercial center, we call the former's attention to the *established truth* that the Mitchell car is an *investment* and in *no sense a speculation*. Not only is the car manufactured to last but its maintenance is economical—a fact that any man of business sense will thoroughly appreciate.

The principle of maximum power on minimum fuel is exemplified to a high degree in the Mitchell Models for 1914 and the strength of axles, frame, springs and other important features is calculated to resist successfully and repeatedly the severe strains and jolts and twists of rough country roads.

Such facts *must* be considered carefully to preserve an automobile as a daily utility and prevent it from becoming a costly luxury. Your Mitchell of today will be looking well and serving you faithfully several years from now and thus annually the cost of your original investment is decreased until it finally disappears.

The Mitchell Models for 1914:

The Mitchell Little Six—fifty horse-power—132-inch wheel base—36x4½ inch tires—two or five passenger capacity - - $1,895

The Mitchell Big Six—sixty horse-power—144-inch wheel base—37x5-inch tires—seven passenger capacity - - - - $2,350

The Mitchell Four—forty horse-power—four cylinders—120 inch wheel base—36x4½ inch tires—two or five passenger capacity $1,595

Equipment of all the Mitchell Models Included in the List Prices Here Given

Electric self-starter and generator—elecric lights—electric horn—electric magnetic exploring lamp—speedometer—mohair top and dust cover—Jiffy quick-action side curtains—quick-action rain vision wind-shield—demountable rims with one extra—tungsten valves—double extra tire carriers—Bair bow holders—license plate bracket—pump, jack and complete set of tools. Prices F. O. B. Racine.

PRACTICAL RURAL CREDITS

The question of rural credits, or as it really means, the easy and convenient method of borrowing money by the farmers, is certainly receiving its full measure of attention just now. I sometimes wonder if the proposed changes do not merely propose another way of grabbing money, honestly made from the quiet pursuit of agricultural labors, taking it to the centers of mysterious financial operations, and then sending it back to the country for discounting purposes, loaded down with a half-dozen "middle-men's" profits.

As a general rule, we farmers of the East can always go to our bank and easily borrow money sufficient for our needs at as low a rate of interest as any other business man. The one distressing fault seems to be that these are short-time loans, and must be repaid or renewed at maturity, the latter being nothing more than the payment of interest and a little bother. It must be our brethern in the South and West who are looking for some form of relief. They have large tracts of land to develop, which requires machinery of all descriptions, and also necessitates the purchase of quantities of chemical fertilizing elements. All this requires much money, more than can be easily repaid in a year or two, hence the necessity of the national government providing means whereby some kind of credit may be given. The least of these should be the depositing of government money in country banks, furnishing the same sort of security as has been furnished for years by those philanthropical institutions in Wall street. Why not? Are failures more frequent in the country than they are in the city of Bulls and Bears?

Joseph W. Roper, of East Orange, N. J., has developed a theory which he expounded recently in an address before the Essex Civic League. He said in part: "In recent years the cost of developing farms, including the expensive machinery and equipment for transportation, has been so great that none but capitalists can undertake the task. This is the reason that farm after farm lies a barren waste today thruout our country, with houses and implements going to ruin while our food prices keep going up. Give the farmer a chance like the merchant and you will find that food prices will go down as a natural result of competition. The chance the farmer needs is the power to borrow until his land is on a paying basis. To accomplish this the best plan, in my opinion, is the farm mortgage 4 percent bond, issuable by the state on a 60 percent. valuation of the farms and sold broadcast."

This seems to me to be "just another theory." Our farmers do not wish a "Credit Mobilier." They are not attempting to float a South Sea Island scheme, neither are they building castles in the air. It is true that the theories of many of the so-called farm philosophers may have caused the farmers' dreams to become Utopian, but after all the farmer knows pretty nearly what he wants, and he is going after it until he gets it. He will not be misled by such schemes which try to make him believe that he will soon acquire so much land that congress will have to pass a law limiting the number of acres any one man may own. If we ever have such a law, it will be to dissipate such conditions as prevail in England, and not to limit the size of the farm of the "Man with the Hoe."

After reading much and hearing a whole lot more about the "rural credit system," it is really refreshing to know of some one place where the people themselves are making a success of a similar idea. We American farmers have already learned much from those who emigrate hither from overseas, but nothing has been brought home closer to my mind than the manner in which financial aid is extended to Jewish farmers by organizations composed of those of their own race.

Since the opening of last year five co-operative credit unions have been organized by Jewish farmers in New Jersey alone, for the purpose of loaning small sums of money at reasonable rates to such of their own number as may need it. One is located at Carmel, Cumberland county, with 36 members; another at Flemington, Hunterdon County, with 22 members; a third at Hightstown, Mercer County, with 32 members; a fourth at Perrineville, Monmouth County, with 29 members, and the fifth at Woodbine, Cape May County, with 28 members.

In addition, the Jewish organization which is back of the co-operative credit system maintains 10 young men in attendance at the short course in agriculture at the State College, paying $90 a year each for their maintenance and tuition. And still further, a Jewish employment bureau has placed 154 men upon farms in New Jersey, some of them as skilled men making from $35 to $50 per month and board and lodging while others are doing ordinary farm work at the average of farm wages thruout the state. The most of these men are employed by non-Jewish farmers.

Two systems for giving financial aid to Jewish farmers—the land credit system and the co-operative credit system—have been in successful operation in New Jersey and the nation at large for a number of years. The first was established in 1890 thru the agency of the Baron de Hirsch foundation. It made loans to Jewish farmers from its inception. By 1900 this particular phase of the foundation's work had so increased that the Jewish Agricultural and Industrial Aid society was incorporated to look after the agricultural end of the fund's work. In fourteen years this society has granted 2,800 loans aggregating about $1,800,000, to 2,500 Jewish farmers in thirty-one states and Canada. The rate of interest is 4 percent. These loans are secured by mortgages, are repayable by amortization in graduated annual payments and some $800,000 has been thus repaid.

In addition to the above aid society, co-operative credit unions have been organized somewhat on the Raiffeisen bank plan of Europe, for the purpose of making small loans for a short time, at reasonable interest, to buy stock, seed, fertilizer or farm implements. A number of Jewish farmers get together and form a union. Each subscribes to one or more shares at $5 a share and pays from 60 cents to $1.80 a year dues. When $500 is thus subscribed and paid in, the Jewish Agricultural and Industrial Aid Society loans the union $1,000 at 2 percent to begin operations, the money being supplied by the Baron de Hirsch Foundation and by the Jewish Colonization Society of Paris. Any member of the union may then borrow from the union to the extent of $100, for not longer than six months, at 6 percent upon giving his personal note with two other members as security.

It is claimed that the co-operative credit associations established in New Jersey and 30 other states, to aid Jewish farmers, are the pioneers of such organizations in this country, and that their successful operation, without the aid of special legislation, proves the adaptibility and benefits of the credit system in general use in Europe to the farmers and agricultural interests of the United States. It has been suggested that the Grange might form some such association to aid its members, but that organization has not thus far seen fit to adopt any such plan.—D. T. Hendrickson.

NEW JERSEY GRANGE NOTES

New Jersey granges are noted for selecting for their officers solid substantial farmers and their wives and daughters,—the kind that will give inspiration to any kind of an organization. Among such officials, who have just been installed are: Grand View Grange, of Flemington, Master, James J. Higgins; secretary, William Y. Holt. Stillwater Grange No. 177 ,has chosen John W. Earl, for master, and William C. Earl for secretary. B. B. Hill is the new master of Swartswood Grange, and A. W. Huff, secretary. George L. DuBois is the new master of Monmouth Grange at Freehold and George W. Blatchley, Jr., secretary. Edward L. Otterson has just been installed master of the grange at Allentown. Carl Ayres is secretary. James McKnight has been elected master of the grange which has just been organzied at Clarksburg. John Ely is secretary. Titusville Grange, which is in a flourishing condition, having 100 members, has chosen William H. Blackwell as master, and J. Hart Smith as secretary. Charles L. Sullivan has been installed as master of Mercer Grange of Hopewell, and J. H. Dalrymple as secretary. John Lownes is now master of Newtown Grange and Miss Edna Watson is secretary.

Shrewsbury Grange, of Red Bank held a Christmas tree sociable. Each member bought an article valued at ten cents and these things were distributed as gifts to the grange members. A lot of fun resulted from this promiscuous giving. There was a large Christmas tree upon which the gifts were placed. A number of songs and recitations were given, after which refreshments of fruit, candy, cake and ice cream were served. Farmingdale Grange has just celebrated its eighth birthday. Over 100 visitors were entertained, every grange in Monmouth County being represented. Several fine addresses were made.—D. T. H.

Facts About Foods---I.

By Mrs. C. W. FOULK.

Food Classes and Uses

The up-to-date farmer knows that a properly fed horse can pull a heavy load easier than the poorly fed animal. The dairyman knows that by proper feeding and care the butter producing ability of a cow can be greatly increased. The stockman has learned what foods best fatten baby-beeves. But how few housekeepers know that by proper feeding the family can be made more efficient workers with both hands and brain.

The study of domestic science is not the cooking and preparation of dainty and elaborate dishes, and when a school offers no more than this it has become a mere cooking school. A course of domestic science, among other things, means a study of foods, of man's digestive system, and the discovery of what foods to use under varying conditions to obtain the best results. The man working in the fields needs an entirely different diet from the man sitting all day at an office desk. The wise farmer first decides whether a calf is to be fattened for the butchers' block or whether it is to be kept for dairy purposes, and then so feeds the animal as to get it as soon as possible up to the standard; the wise housekeeper will so feed her family that each member will be best adapted to the work in which he is engaged. In short, the housekeeper as well as the farmer must carefully study ''balanced rations.''

GOOD TYPE OF ROASTER.

What Constitutes Good Feeding.—Incidentally cooking does form a part of any domestic science instruction, but it must be kept in mind that the preparation of foods is but a means to an end, that end being the balanced ration. Most women feel that the family has been well fed where the appetites have been satisfied. But one may have had all the food one could possibly eat, and it may have been the kind one most likes, and still one's body be improperly nourished. Domestic science should not teach how to prepare more and more elaborate concoctions, but it should teach simplicity in both the number and kind of food. There is a mistaken idea that the house keeper who is trained in domestic science feeds her family on elaborate salads, purees, souffles and frappes and other high sounding dishes. On the contrary the table of the trained woman will have less elaborate but more wholesome food. It will be the food containing the proper proportions of the different kinds of food materials to best supply the needs of the family, and these foods will be prepared in a manner that will be the least wasteful and the most digestible. In the diet of the family as well as in household decoration the trained woman will always keep in mind simplicity and usefulness.

In order to better understand the effects of diet upon different individuals, it is necessary to first understand what the foods contain and their use in the body, and it is the purpose of these talks to discuss some of the every-day foods, how to prepare them and when to use them.

When a physician is called, the first thing he usually does is to take the temperature of the patient. The normal temperature of the body is 98.5 degrees F.; anything above this is fever, and anything below shows a state of collapse. This body heat is produced by the oxidation or burning of the food, or in other words the digestion of the food. The same manner in which coal, wood, or fuels are burned to give heat or to produce energy to run machinery, so the food, which is the fuel of the body, is consumed, giving body heat and producing energy to keep the human machinery running. Every thought which passes thru the mind, every breath drawn, every particle of food digested, every motion of the body, requires energy and wears away the body tissue. When any part of a machine wears out or breaks down it must be replaced or repaired. In this particular the human and animal machines have a great advantage over other machines in that they can repair their own waste, and this building up of worn-out parts is accomplished by the digestion and assimilation of foods. A food, then, is anything which when taken into the body yields heat or gives energy or builds up bone, muscle or other body tissues.

All foods are divided into the following five classes:

1. Carbohydrates or Energy and Heat Producers.
   Among these foods are all foods containing starches and sugars, such as flour, potatoes, sugar, etc.
2. Proteids or Muscle Builders.
   The lean of meats, cheese, and eggs are included under this head.
3. Fats or Heat Producers.
   Butter and lard are examples of this kind.
4. Water.
   Three-fourths of the human body is water, and this is furnished by the water we drink and also by the so-called solid foods.
5. Mineral Matter.
   Found largely in fruits and green vegetables. Common table salt is the only mineral salt used in its natural form.

A well-balanced diet must contain all of these different kinds of food materials, and the proportion of each kind of food will vary with the age, sex, climate and occupation.

Food Requisites in Cold

The Eskimos and other peoples in cold regions are known to eat whale oil, tallow candles and other foods repulsive to people in warmer climates. In this they are but following natural instincts and are eating fatty foods, which are heat producers. In the cold winter months when the body is giving off more heat, fatty foods help to furnish the necessary body heat. On the other hand, during warm summer days the diet should be largely made up of foods giving bulk and furnishing little heat.

Food Requirements of Youth and Age.—The large appetites of growing children are proverbial. This is true for several reasons: first, children, because of the greater relative amount of surface exposed, give off more heat and so require more heat producing foods; second, children are more active than adults and need a greater amount of energy producing foods; third, they are growing and need more muscle and tissue builders. For all of these reasons children require more food in proportion to their size than do adults.

Old people need less food than younger and more active people. Many sudden deaths among middle aged and old people apparently due to apoplexy or heart failure, are traceable to overeating. The amount of food eaten is largely habit, and in many cases older people no longer so active as they were, do not materially change the amount or kinds of food. Often they are urged by the younger members of their family to eat more than is necessary under the mistaken idea that the food is necessary to keep up their strength, when in reality their lack of appetite is due to lack of activity, and they would be much better for a lighter diet.

Relation of Sex and Work on Food Needs.—A woman should eat about three-fourths as much food as a man, provided, of course, that they are working and living under the same conditions.

The amount and kind of work or exercise is a great factor in determining the amount and kind of food needed. A man working in the open air at hard labor requires more food and a coarser and bulkier food than the same man could eat if working in doors, because the larger amount of fresh air helps him to oxidize or burn up the food, in other words to digest it. A farmer in order to keep from getting hungry between meals requires a heavier and coarser food than does the lawyer or bookkeeper, who if he should try the diet suitable for the farmer would soon became a dyspeptic.

Any one whose digestion is disordered is very apt to become irritable and impatient, and much bad temper is due, not to bad disposition but to bad digestion. In providing the daily food for the members of her family, the woman has in her care not only their physical well being but to a considerable degree their mental and moral natures as well.

A GOOD TYPE OF ROASTER

This excellent kitchen utensil may be easily kept sweet, clean and sanitary, because it is perfectly smooth and seamless. It will roast meat, fish or fowl so that it is tender, juicy and full of sweet natural flavor, and do it without basting or other attention. This roaster comes in three sizes, steel or enameled, and costs $1 up, according to size. It or similar types can be found in the kitchenware departments of most good housefurnishing stores.

SOME WAYS OF USING PRUNES

Prune Chartreuse.—Line a mold with lemon jelly, decorate the bottom with prunes having first been stoned and let them stand till set. Fill the center with the following mixture: Make a custard with three eggs, one cupful of milk, two tablespoonfuls of powdered gelatine and allow to dissolve. When this is cold, stir in one cupful of prune puree, half a cupful of sugar, and one cupful of whipped cream. Just as it is beginning to set, pour into the prepared mold. Turn out, and serve with whipped cream.

Frozen Cream Cheese With Steamed Prunes.—Two Neufchatel cheeses, half a cupful of thick cream, one-fourth of a teaspoonful of salt, one teaspoonful of sugar and some preserved figs. Mash the cheese to a smooth paste, and add the cream, sugar and salt. Make into squares then bury in ice and salt for several hours. When ready to serve place each on a lettuce leaf, decorate the center of the cheese with a steamed prune stood on end and serve at once.

Prune Russe.—One-fourth of a pound of prunes, one strip of lemon rind, half a cupful of water, one-fourth of a pound of lady fingers, eight pistachio nuts, one tablespoonful of red currant jelly, one teaspoonful of powdered gelatine, one cupful of whipped cream, one teaspoonful of vanilla extract, and two tablespoonfuls of sugar. Soak and stew the prunes in the water with the lemon rind. When quite soft, rub thru a sieve, return to the saucepan, add the red currant jelly and the gelatine dissolved in a little of the juice left over from the prunes. Line a round mold with lady fingers and pour the prune mixture into the center. When cold, turn it out, heap up the whipped cream (sweetened and flavored) on it, and sprinkle the chopped pistachio nuts over it.

Tommy Truckfarm: "Say, Ma, I'm awful glad you're done your wash. I want a lunch to go fishing with. Oh, what do you think—I was out looking at the chickens and that city girl pointed to a chicken and ast me if it laid an egg what would I do with it. I sez 'I'd send it to a museum. That chicken's a rooster.' Ain't you glad you heard about Fels-Naptha Soap and can get your work done so soon!"

Anty Drudge: "It looks to me like you're glad, too. Fels-Naptha is the friend of every one. I always keep a box on hand so's I'll be *sure* to have enough."

The Fels-Naptha way is the best way and the easiest way of doing all kinds of work.

The Fels-Naptha way is the cool-water, no hard-rubbing, time-saving way. For the weekly washing, for housecleaning, scouring greasy pots and pans, making china and glassware glisten, there is nothing so good as Fels-Naptha Soap in cool or lukewarm water.

FELS-NAPTHA

TEETH AND HEALTH

By A. M. Sellars, D.D.S.

We all realize the value of teeth from the standpoint of appearances, but few people comprehend the importance of a well-kept mouth from the standpoint of health. When care of the mouth is spoken of, visions of the dentist's chair and the real or imaginary tortures endured therein arise before the mind. It is a mistaken idea that the time to care for the teeth begins when a need for the dentist's services manifests itself. The care of the mouth should begin at birth, and continue thru life.

Bacteria in the Mouth

The mouth contains all the conditions favorable to the growth of bacteria, and many different kinds are found there. Much of the indigestion in infancy is caused by failure to properly cleanse the mouth after each feeding. Fermentation takes place, and the fermented matter is carried down into the stomach. Many an individual has been compelled to go through life with a weak digestion made so weak by neglect and mismanagement in childhood. Habits both good and bad can be formed. If the mother is careful that the babe's mouth is cleansed after each feeding and she continues this practice until the child is old enough to care for its own mouth, a good habit will have been formed and there will be no trouble in getting the child to keep up the practice.

People would not think of serving a meal on the unwashed dishes of the previous meal, but they will permit food to remain in unfilled cavities in their teeth, to decompose and to be mixed with the food of the next meal.

Teeth Cutting Trouble

If the mother forms the habit of cleansing baby's mouth after each feeding there will probably be less trouble with the digestion during the eruption of the teeth. The eruption of the teeth causes more or less inflammation of the gums, and the extra heat creates a better medium for the growth of microbes. At this time nature herself attempts to provide a remedy for the evil consequences which would naturally follow the inflammatory condition which necessarily prevails in the mouth when babies are getting their first teeth. An increased flow of saliva is the first sign of the coming of the teeth. Then, too, its great abundance helps to wash the mouth free of any food which remains after feeding. This is a very good illustration of the wonderful manner in which nature tries to provide for our welfare.

The time of the eruption of the temporary teeth is too often an unnecessary period of stress. Even when the teething process follows a normal course the gums are more or less tender, but they are made actually painful by improper preparation for this period by the right kind of feeding and care. Particular attention should be given to the food of the child during this period. The quantity of the food taken many times has an important bearing on the digestion. The child may be getting too much or it may be getting too little nourishment from what it does take. You should have the advice of a competent physician about this. The only set rule is that the child must be nourished. The kind and amount will depend on the child itself. No man or woman with painful teeth and gums and living on insufficient nourishment is capable of the highest degree of efficiency. So likewise no child suffering from painful mouth conditions and faulty nutrition can grow properly. Many of the physical handicaps that mature people contend with were caused by the interruptions to the normal development in the growing period. This growing time lasts only one-fourth of a long life.

Care of Temporary Teeth

After the temporary teeth are in place the inflammatory condition which has existed most of the time from the sixth to the twentieth months will subside. Normal conditions will prevail until about the sixth year, when eruption of the permanent teeth begins. All cavities in the temporary teeth should have been kept filled, as it is impossible for a child to have good conditions for preservation of the permanent teeth if the temporary teeth are not kept filled.

It is important that the temporary teeth be kept in place until the permanent ones that will take their places are ready to erupt. One mistake often made by mothers is thinking that the sixth-year molar, which erupts just back of the temporary molars (which come in before the end of the second year) is a temporary tooth. Every mother should write down in her memory that the temporary teeth are ten in number in each jaw, and that they will all be in place before the end of the third year.

The Permanent Teeth

The molar which comes in the sixth year is the first permanent tooth to erupt. During the eruption of the permanent teeth we again have to combat inflammation of the gums.

Between the sixth and fourteenth year the teeth are extremely susceptible to decay. In the last three years that each temporary tooth remains in the mouth the roots are undergoing absorption, hence treating and filling them is a very unsatisfactory process. This makes it almost impossible to prevent all decay from being present in the mouth. During this time when extra care of the teeth is required to keep them clean seems to be just the time when most mouths are neglected. This would not so often be the case if mothers began right and kept their work up till the child itself is old enough to understand the importance of a clean mouth.

If the permanent teeth erupt in such a manner as to prevent closing the lips properly, a dentist should be consulted. The nose was made to breathe thru, but if the lips cannot be comfortably closed mouth breathing will be the result with all its resulting dangers and ills. Besides the nose can not be developed properly without proper use.

Pyorrhea alveolaris, which results in receding gums and loosened teeth, would probably be almost eliminated if teeth were not neglected at some period in life. Very often this neglect occurs during illness, and the evil effects are not noticed till considerable damage is done.

It is never too late to begin to take proper care of the mouth. If neglect has caused damage more neglect will cause more damage, hence the time to begin is when you realize that it is necessary.

BE CAREFUL WITH MATCHES.

The match, while only a small instrument, is a very dangerous one under certain conditions. Few people realize what a dangerous combination matches and mice may form. It is probable that many a fire, the origin of which has seemed a mystery, was caused by mice nibbling at the heads of matches, thus igniting them and setting fire to the buildings. It is thought that the fumes of match heads induce mice to nibble at them.

Personally, I had not realized the danger from fire along this line until six years ago when fire broke out in an upstairs closet of a room that contained no chimney or any chance for fire to have started except by a mouse and a match. One afternoon smoke was discovered to be forming in one of the rooms down stairs; it was traced to the room upstairs which contained the closet mentioned above. The contents of this closet, also the bed clothes of a bed near the closet were on fire. The fire was kept from gaining rapid headway by the fact that the window and door of this room were closed when the fire started. Entrance to the room could be gained only by placing a ladder to the window from the outside. By prompt assistance from neighbors who were given the alarm by telephone, the fire was gotten under control.

We ascertained that mice had chewed thru the chair-board of this room, and had built nests in the closet among some of the material stored in it, for a charred nest was found in the smouldering material in the closet. This room had been used for a bedroom by a hired man, and matches were found in an open box on a stand where it was possible for the mice to get at them. As there was absolutely no chance for fire to start in this closet except by matches being carried there and ignited by mice, this experience reveals how dangerous a combination matches and mice may prove to be.

Since this experience we have made it a rule to keep all matches in boxes with a lid, and all employes are instructed to keep the lid of box closed so that mice can not gain entrance to the matches. Empty cigar boxes with the lid on or other similar boxes are suitable for this purpose. I do not think that employes are so apt to drop matches and let them lie on the floor, when getting them from a convenient-sized box as when pulled from a match safe hung on the wall.

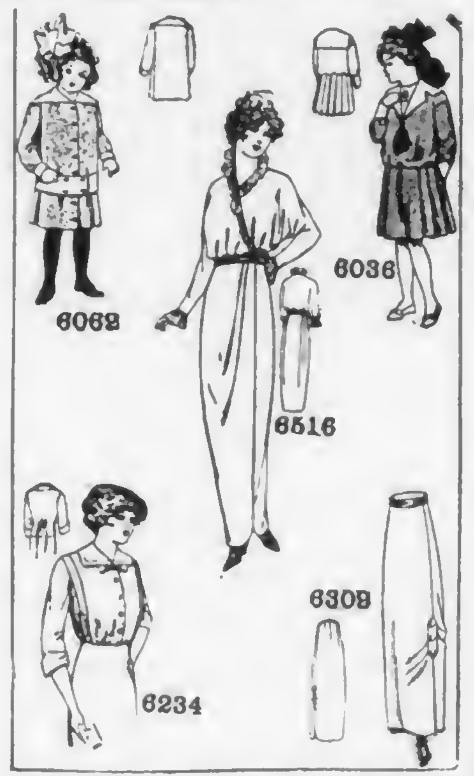
Another dangerous practice is carrying matches loose in the pocket, especially by hired men who chore and labor in the barns. Especially is this true if the matches are carried in the pocket with articles, possibly to be pulled from the pocket with other articles and dropped in the barn unknowingly. When I have an employe who is in the habit of carrying matches in his pocket I insist that he carry them in some good match safe, and if he hasn't one I purchase one for him. It is impossible to keep all mice out of the barns, so I try as much as possible to avoid any chances of matches being dropped in the barn by employes. Even tho some employes assert that they carry their matches in a separate pocket, I do not consider this safe, for at times certain kinds of labor require a man to work in such a position as to cause the matches to drop from his pocket.

It is true that the tipped matches now manufactured are not so dangerous as the old-fashioned sulphur match, yet this tip if properly nibbled by a mouse could be ignited. There is a safety match manufactured that will not light except on the box, or by fire. These matches would be ''it'' if they were entirely satisfactory as a general purpose match, but I haven't found any yet that are so.

There is no doubt that many of the fires supposed to be caused by spontaneous combustion or of ordinary origin could be traced to matches ignited by mice or by trampling of animals in the barn. I doubt if many fires are started by spontaneous combustion caused by hay or grain heating, as it is claimed that hay or grain would have to reach a degree of heat 100 degrees hotter than boiling water before spontaneous combustion could take place.—C. R. Weidle, Erie Co., Pa.

PENNSYLVANIA FARMER PATTERNS.

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.



6062—Children's Dress.—Cut in sizes 2 to 8 years. Size 8 years requires 2½ yards of 36-inch material. Price of pattern 10 cents.

6516—Ladies' Dress.—Cut in sizes 34 to 44 inches bust measure. Size 36 requires 2¾ yards of 54-inch material. Price, 10 cents.

6036—Girls' Blouse Dress.—Cut in sizes 6 to 12 years. Size 8 requires 2¼ yards of 36-inch material. Price 10 cents.

6234—Ladies' Shirt Waist.—Cut in sizes 34 to 42 inches, bust measure. Size 38 requires 2¾ yards of 36-inch material. Price 10 cents.

6309—Ladies' Two Gored Skirt.—Cut in sizes 22 to 30 inches, waist measure. Size 22 requires 2⅝ yards of 36-inch material. Price 10 cents.

THE "BEST" LIGHT

200 styles—carry a brilliant illumination into homes that have had to struggle along on oil, gas or candles. Brighter than acetylene or electricity and costs only two cents a week. Agents write to-day.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

SYNOPSIS OF PREVIOUS CHAPTERS.

Farmer Winston, having failed as a homesteader, desperate, accepts a proposal to simulate Lance Courthorne, an adventurer. Courthorne and his pals are thus able to carry thru some smuggling operations. In the clash with the police, Courthorne kills Trooper Shannon, leaving evidence pointing to Winston as the murderer. The scene shifts to Silverdale, founded by Colonel Barrington. The Colonel is worried over wheat operations and the coming advent of Lance Courthorne, cousin to Maud Barrington, niece and ward of Colonel Barrington, to claim his share of his father's estate. Maud Barrington is told of Courthorne's past misdeeds. Winston, meanwhile, has pushed on to Montana, being held and later released, for lack o evidence, by a government officer, who discloses the belief on the part of the police that Winston is the murderer of Trooper Shannon. A letter for Courthorne is opened by Winston. Complying with instructions therein, he meets and confers with a lawyer respecting Courthorne's inherited acres at Silverdale, and following out his role as simulator of Courthorne, goes to Silverdale and is there received as graciously as could be expected. Some of his actions fail to tally with Courthorne's reputation. He wins the good will of Dane, one of the Colonel's advisers. The real Courthorne, who was supposed to have been drowned during the smuggling adventure, now reappears in Montana, inadvertently learns of his inheritance, and pieces together conclusive evidence that Winston has gone to Silverdale. Courthorne and Ailly Blake, whose life he has blighted, agree to ignore each other's identity. Winston and Maud Barrington, caught by a blizzard while driving to Silverdale, find shelter in a deserted shed over night, where he acts the part of a considerate gentleman. Maud Barrington promises Winston to sow her land in wheat the following spring. Under criticism from the Colonel Winston begins planting operations. He is commended by Maud Barrington for successful efforts to break the gambling habits of Ferris, a young Englishman, a task undertaken at her request. Courthorne now appears and Winston contracts to advance him money, provided he absents himself immediately. During a fire which threatens the wheat fields Winston is injured. Suspicions point to Ferris as the incendiary. Questioned, he admits his guilt, and is dispatched from the settlement. Winston soon recuperates. He goes to Winnipeg, meets and advises with Graham, a broker and by watching the market sells his wheat and that of friends at big profits. In gratitude Winston's friends pledge him their loyalty and unbiased support in Silverdale affairs. Colonel Barrington disregarding advice loses heavily.

CHAPTER XIX

Under Test

The prairie lay dim and shadowy in the creeping dusk when Winston sat a redwood stringer near the head of his partly-finished bridge. There was no sound from the hollow behind him but the faint gurgle of the creek, and the almost imperceptible vibration of countless minute wings. The birches which climbed the slope to it wound away sinuously, a black wall on either hand, and the prairie lying gray and still stretched back into the silence in front of him. Here and there a smoldering fire showed dully red on the brink of the ravine, but the tired men who had lighted them were already wrapped in heavy slumber.

The prairie hay was gathered, harvest had not come and for the last few weeks Winston, with his hired men from the bush of Ontario, had toiled at the bridge with a tireless persistency which had somewhat astonished the gentlemen farmers of Silverdale. They, however, rode over every now and then, and most cheerfully rendered what assistance they could, until it was time to return for tennis or shooting sweepstake, and Winston thanked them gravely, even when he and his Ontario axmen found it necessary to do the work again. He could have told nobody why he had undertaken to build the bridge, which could be of no use to him; but he was in a measure prompted by instincts born in him, for he was one of the Englishmen who, with a dim recognition of the primeval charge to subdue the earth and render it fruitful, gravitate to the newer lands, and usually leave their mark upon them. He had also a half-defined notion that it would be something he could leave behind in reparation, that the men of Silverdale might remember more leniently the stranger who had imposed on them; while in the strain of the mental struggle strenuous occupation was a necessity to him.

A bundle of papers it was now too dim to see lay beside him clammy with dew, and he sat bare-headed, a pipe which had gone out in his hand, staring across the prairies with an ironical smile in his eyes. He had planned boldly and striven tirelessly, and now the fee he could not take would surely be tendered him. Wheat was growing dearer every day, and such crops as he had sown had not been seen at Silverdale. Still, the man who had few compunctions before he met Maud Barrington, knew now that in a little while he must leave all he had painfully achieved behind. What he would do then he did not know, for only one fact seemed certain—in another four months, or less, he would have turned his back on Silverdale.

Presently, however, the sound of horse-hoofs caught his ears, and he stood up when a mounted figure rose out of the prairie. The moon had just swung up, round and coppery, from behind a rise, and when horse and rider cut black and sharp against it his pulses throbbed faster and a little flush crept into his face, for he knew every line of the figure in the saddle. Some minutes had passed when Maud Barrington rode slowly to the head of the bridge, and pulled up her horse at the sight of him.

The moon turning silver now shone behind her head, and a tress of hair sparkled beneath her wide hat, while the man had a glimpse of the gleaming whiteness of rounded cheek and neck. Her face he could not see, but shapely shoulders, curve of waist, and sweeping line of the light habit were forced up as in a daguerreotype and as the girl sat still looking down on him, slender, lissom, dainty, etherealized almost by the brightening radiance, she seemed to him a visionary complement of the harmonies of the night. It also appeared wiser to think of her as such than a being of flesh and blood whom he had ventured to long for, and he almost regretted when her first words dispelled the illusion.

"It is dreadfully late," she said. "Pluto went very lame soon after I left Macdonald's, and I knew if I went back for another horse he would have insisted on riding home with me. I had slipped away while he was in the granary. One can cross the bridge?"

"Not mounted!" said Winston. "There are only a few planks between the stringers here and there, but, if you don't mind waiting, I can lead your horse across."

He smiled a little, for the words seemed trivial and out of place in face of the effect the girl's appearance had on him, but she glanced at him questioningly.

"No!" she said. "Now, I would have gone round by the old bridge, only that Allardyce told me you let him ride across this afternoon."

"Still," and the man stopped a moment, "it was daylight then, you see."

Maud Barrington laughed a little, for his face was visible and she understood the slowness of his answer. "Is that all? It is moonlight now."

"No," said Winston dryly, "but one is apt to make an explanation too complete occasionally. Will you let me help you down?"

Maud Barrington held out her hands, and when he swung her down watched him tramp away with the horse, with a curious smile. A light compliment seldom afforded her much pleasure, but the man's grim reserve had now and then piqued more than her curiosity, tho she was sensible that the efforts she occasionally made to uncover what lay behind it were not without their risk. Then he came back, and turned to her very gravely.

"Let me have your hand," he said.

Maud Barrington gave it to him, and hoped the curious little thrill that ran thru her when his hard fingers closed upon her palm did not communicate itself to him. She also noticed that he moved his head sharply a moment, and then looked straight in front again. Then the birches seemed to fall away beneath them, and they moved out across the dim gully with the loosely-laid planking rattling under their feet, until they came to a strip scarcely three feet wide which spanned a gulf of blackness in the shadow of the trees.

"Hold fast!" said Winston, with a trace of hoarseness. "You are sure you feel quite steady?"

"Of course!" said the girl, with a little laugh, tho she recognized the anxiety in his voice, and felt his hand close almost cruelly on her own. She was by no means timorous, and still less fanciful, but when they moved out into the blackness that closed about them above and beneath along the slender strip of swaying timber she was glad of the masterful grip. It seemed in some strange fashion portentous, for she felt that she would once more be willing to brave unseen perils, secure only in his guidance. What he felt she did not know, and was sensible of an almost overwhelming curiosity, until when at last well-stiffened timber lay beneath them, she contrived to drop a glove just where the moonlight smote the bridge. Winston stooped, and his face was clear in the silvery light when he rose again. Maud Barrington saw the relief in it, and compelled by some influence stood still looking at him with a little glow behind the smile in her eyes. A good deal was revealed to both of them in that instant, but the man dared not admit it, and was master of himself.

"Yes," he said, very simply, "I am glad you are across."

Maud Barrington laughed. "I scarcely fancy the risk was very great, but tell me about the bridge," she said. "You are living beside it?"

"Yes," said Winston. "In a tent. I must have it finished before harvest, you see!"

Winston smiled dryly. "I am used to it, and can do all the cooking that is necessary," he said. "It is the usual home for the beginner, and I lived six months in one—on grindstone bread, the tinctured glucose you are probably not acquainted with as 'drips,' and rancid pork—when I first came out to this country and hired myself, for ten dollars monthly, to another man. It is a diet one gets a little tired of occasionally, but after breaking prairies twelve hours every day one can eat almost anything, and when I afterwards turned farmer my credit was rarely good enough to provide the pork."

The girl looked at him curiously, for she knew how some of the smaller settlers lived, and once more felt divided between wonder and sympathy. She could picture the grim self-denial, for she had seen the stubborn patience in this man's face, as well as a stamp that was not born by any other man at Silverdale. Some of the crofter settlers, who periodically came near starvation in their sod hovels, and the men from Ontario who staked their little handful of dollars on the first wheat crop to be wrested from the prairie, bore it, however. From what Miss Barrington had told her, it was clear that Courthorne's first year in Canada could not have been spent in this fashion, but there was no doubt in the girl's mind as she listened. Her faith was equal to a more strenuous test.

"There is a difference in the present, but who taught you bridge-building? It takes years to learn the use of the ax," she said.

Winston laughed. "I think it took me four, but the man who has not a dollar to spare usually finds out how to do a good many things for himself, and I had working drawings of the bridge made in Winnipeg. Besides, your friends have helped with their hands as well as their good-will. Except at the beginning, they have all been kind to me, and one could not well have expected very much from them then."

Maud Barrington colored a trifle as she remembered her own attitude towards him. "Cannot you forget it?" she said, with a curious little ring in her voice. "They would do anything you asked them now."

"One generally finds it useful to have a good memory and I remember most clearly that, altho they had very little reason for it, most of them afterwards trusted me. That made, and still makes, a great difference to me."

The girl appeared thoughtful. "Does it?" she said. "Still, do you know, I fancy that if they had tried to drive you out, you would have stayed in spite of them?"

"Yes," said Winston dryly. "I believe I would, but the fact that in a very little while they held out a friendly hand to a stranger steeped in suspicion, and gave him the chance to prove himself their equal, carries a big responsibility. That, and your aunt's goodness, puts so many things one might have done out of the question."

The obvious inference was that the prodigal had been reclaimed by the simple means of putting him on his honor, but that did not for a moment suggest itself to the girl. She had often regretted her own disbelief and once more felt the need for reparation.

"Lance," she said, very quietly, "my aunt was wiser than I was, but she was mistaken. What she gave you out of wide charity was already yours by right."

That was complete and final, for Maud Barrington did nothing by half, and Winston recognized that she held him blameless in the past, which she could not know, as well as in the present which was visible to her. Her confidence stung him as a whip, and when in place of answering he looked away, the girl fancied that a smothered groan escaped him. She waited, curiously expectant, but he did not speak, and just then the fall of hoofs rose from behind the birches in the bluff. Then a man's voice came thru it singing a little French song, and Maud Barrington glanced at her companion.

"Lance," she said, "how long is it since you sang that song?"

"Well," said Winston, doggedly conscious of what he was doing, "I do not know a word of it, and never heard it in my life."

Maud Barrington stared at him. "Think," she said. "It seems ever so long ago, but you cannot have forgotten. Surely you remember Madame Aubert, who taught me to prattle in French, and the day you slipped into the music-room and picked up the song, while she tried in vain to teach it to me. Can't you recollect how I cried, when you sang it in the billiard-room, and Uncle Geoffrey gave you the half-sovereign which had been promised to me?"

"No," said Winston, a trifle hoarsely, and with his head turned from her watched the trail.

A man in embroidered deerskin jacket was riding into the moonlight, and tho the little song had ceased, and the wide hat hid his face, there was an almost insolent gracefulness in his carriage that seemed familiar to Winston. It was not the abandon of the swashbuckler stock-rider from across the frontier, but something more finished and distinguished that suggested the bygone cavalier. Maud Barrington, it was evident, also noticed it.

"Geoffrey Courthorne rode as that man does," she said. "I remember hearing my mother once tell him that he had been born too late, because his attributes and tastes would have fitted him to follow Prince Rupert."

Winston made no answer, and the man rode on until he drew bridle in front of them. Then he swung his hat off, and while the moonlight shone into his face looked down with a little ironical smile at the man and woman standing beside the horse. Winston closed one hand a trifle, and slowly straightened himself, feeling that there was no need of all his self-control, for he saw his companion glance at him, and then almost too steadily at Lance Courthorne.

The latter said nothing for a space of seconds, for which Winston hated him, and yet in the tension of the suspense he noticed that the signs of indulgence he had seen on the last occasion were plainer in Courthorne's face. The little bitter smile upon his lips was also not quite in keeping with the restlessness of his fingers upon the bridle.

"Is that bridge fit for crossing, farmer?" he asked.

"Yes," said Winston quietly. "You must lead your horse."

Maud Barrington had in the meanwhile stood very still, and now moved as by an effort. "It is time I rode on, and you can show the stranger across," she said. "I have kept you at least five minutes longer than was necessary."

Courthorne, Winston fancied, shifted one foot from the stirrup, but then sat still as the farmer held his hand for the girl to mount by, while when she rode away he looked at his companion with a trace of anger as well as irony in his eyes.

"Yes," said Winston. "What you heard was correct. Miss Barrington's horse fell lame coming from one of the farms, which accounts for her passing here so late. I had just led the beast across the incompleted bridge. Still, it is not on my account I tell you this. Where have you been and why have you broken one of my conditions?"

Courthorne laughed. "It seems to me you are adopting a somewhat curious tone. I went to my homestead to look for you."

"You have not answered my other question, and in the meanwhile I am your tenant, and the place is mine."

"We really needn't quibble," said Courthorne. "I came for the very simple reason that I wanted money."

"You had one thousand dollars," said Winston dryly.

Courthorne made a little gesture of resignation. "It is, however, certain that I haven't got them now. They went as dollars usually do. The fact is, I have met one or two men recently who apparently know rather more games of chance than I do, and I passed on the fame which was my most valuable asset, to you."

"You passed me on the brand of a crime I never committed," said Winston grimly. "That, however, is not the question now. Not one dollar except at the time agreed upon, will you get from me. Why did you come here dressed as we usually are on the prairie?"

Courthorne glanced down at the deerskin jacket and smiled as he straightened himself into a caricature of Winston's mounted attitude. It was done cleverly.

"When I ride in this fashion we are really not very unlike, you see, and I let one or two men I met get a good look at me," he said. "I meant it as a hint that it would be wise of you to come to terms with me."

"I have done so already. You made the bargain."

"Well," said Courthorne, smiling, "a contract may be modified at any time when both parties are willing."

"One is not," said Winston dryly. "You heard my terms, and nothing that you can urge will move me a hairsbreadth from them."

Courthorne looked at him steadily, and some men would have found his glance disconcerting, for now and then all the wickedness that was in him showed in his half-closed eyes. Still, he saw that the farmer was unyielding.

"Then we will let it go; in the meanwhile," he said "take me across the bridge."

They were half-way along it when he pulled the horse up, and once more looked down on Winston.

"Your hand is a tolerably good one so long as you are willing to sacrifice yourself, but it has its weak points, and there is one thing I could not tolerate," he said.

"What is that?"

Courthorne laughed wickedly. "You wish me to be explicit? Maud Barrington is devilishly pretty, but it is quite out of the question that you should ever marry her."

Winston turned towards him with the veins on his forehead swollen. "Granting that it is so, what is that to you?"

Courthorne nodded as if in comprehension. "Well, I'm probably not consistent, but one rarely quite loses touch with everything, and if I believed that my kins-woman was growing fond of a beggarly prairie farmer, I'd venture to put a sudden stop to your love-making. This, at least, is perfectly bona fide, Winston."

Winston had borne a good deal of late, and his hatred of the man flared up. He had no definite intention, but he moved a pace forward, and Courthorne touched the horse with his heel. It backed, and then, growing afraid of the blackness about it, plunged, while Winston for the first time saw that there was a gap in the loosely-laid planking close behind it. Another plunge or flounder, and horse and rider would go down together.

For a moment he held his breath and watched. Then as the beast resisting its rider's efforts backed again, he sprang forward and seized the bridle.

"Get your spurs in! Shove him forward for your life," he said.

There was a momentary struggle on the slippery planking, and, almost as its hind hoofs overhung the edge, Winston dragged the horse away. Courthorne swung himself out of the saddle, left the farmer the bridle, and glanced behind him at the gap. Then he turned, and the two men looked at each other steadily. Their faces were a trifle paler than usual.

"You saw it?" asked Courthorne.

"Yes, but not until you backed the beast and he commenced plunging."

"He plunged once or twice before you caught the bridle."

"Yes," said Winston quietly.

Courthorne laughed. "You are a curious man. It would have cleared the ground for you."

"No," said Winston dryly. "I don't know that you will understand me, but I scarcely think that it would. It may have been a mistake of mine to do what I did, but I have a good deal on my shoulders already."

Courthorne made no answer as he led his horse across the bridge. Then he mounted, and looked down on the farmer who stood beside him.

"I remember some things, tho I don't always let them influence me to my detriment," he said. "I'm going back to the railroad, and the West, and don't quite know when you will have the pleasure of seeing me again."

Winston watched him quietly. "It would be wiser if you did not come back until I send for you."

(To be continued)

LET US TAN YOUR HIDE.

Cattle or Horse hide, Calf, Dog, Deer or any kind of skin with hair or fur on. **We tan and finish them right;** make them into coats (for men and women), robes, rugs or gloves when ordered.

Your fur goods will cost you less than to buy them, and be worth more. **Our illustrated catalog** gives a lot of information which every stock raiser should have, but we never send out this valuable book except upon request.

It tells how to take off and care for hides; how and when **we pay the freight both ways**; about our safe dyeing process which is a tremendous advantage to the customer, especially on **horse hides and calf skins**; about the fur goods and game trophies we sell, taxidermy, etc. If you want a copy send us your correct address.

The Crosby Frisian Fur Company,
571 Lyell Ave., Rochester, N. Y.

Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE *100 Per Cent Planters*

often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "*100 Per Cent Potato Planting*" and copy of IronAge Farm and Garden News.

Practical Potato Culture

is the name of a valuable Treatise on Potato Culture by **E. A. Rogers**, the well known potato authority from Cumberland Co., Maine.

The book contains much valuable information on selection of seed, planting, cultivation, harvesting and storing potatoes. Contains 126 pages printed on good quality of paper, handsomely illustrated by actual photographs of fields of potatoes showing different stages of growth.

This is a very valuable book and should be in the hands of every one interested in potato growing.

How to get it.—Send us 2 yearly subscriptions to Pennsylvania Farmer at 50 cents each, and the book will be mailed to you by return mail. Address

Studebaker WAGONS BUGGIES HARNESS

In use for 42 years —and still going

FORTY-TWO years ago Mr. Balch of Coshocton, Ohio, bought a Studebaker farm wagon. He used this wagon for twenty-two years and then turned it over to his son, L. J. Balch. In a letter to Studebaker, ordering another wagon, Mr. Balch writes:

"My father used it for 22 years and I have used it for twenty years and can say that there has never been a spoke moved in any of the wheels and it has the same boxing and spindles that were put in it when made. Tires have been changed from narrow to broad. but axles, bolsters and singletrees are those originally furnished with wagon. Last summer I hauled 6,800 pounds of weighed material in it at one load."

NOT UNUSUAL FOR A STUDEBAKER WAGON

You can buy a Studebaker wagon today that will repeat the performance of the wagon owned by Mr. Balch. We are building wagons today with the same care and of just as good material as we did when Mr. Balch bought his wagon. In fact, Studebaker wagons, because of improved methods of making, are even better today.

When you buy a wagon don't judge it by its looks alone. Stop and think what is underneath the paint.

You may be offered a wagon that looks as good as a Studebaker and the price may be less—but when you stop and figure that the cheaper wagon will probably last you five or ten years whereas a Studebaker will last a life time there is only one answer—You want a Studebaker.

Whether it is a Farm Wagon, Buggy or Harness, Studebaker's policy is "build not the cheapest but the best."

Invest your money where you get the largest returns buy a Studebaker.

PHILADELPHIA LIVE STOCK.

Philadelphia, Pa., Jan. 19, 1914.

The usual cold weather activity in beef-cattle was lacking. Offerings were light but ample, with prices firmly held on the most desirable steers. Pennsylvania, Ohio and Illinois cattle were on sale.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,316	13,557	6,463
Previous week	2,610	10,167	6,817

Best steers	$8.65@8.80
Choice steers	8.50@8.60
Good	8.30@8.40
Medium steers	7.87@8.10
Medium steers	7.50@7.65
Common steers	7.50@7.65
Bulls	5.25@6.70
Fat Cows	6.20@6.75
Medium cows	4.75@5.75
Thin cows	2.75@4.00
Milk cows	45.00@75.00

Veal calves steady.

Best calves	$11.50@12.00
Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do.	6.50@7.00
Culls	5.00@8.00

Sheep.—There was a good increase in receipts, but demand was lacking. Values closed steady.

Choice wethers	$6.00@6.25
Good do.	5.00@5.25
Common to medium	3.00@4.25
Ewes, fat	5.00@5.25
Extra lambs	8.50@8.75
Good to choice do	8.00@8.25
Common to medium	6.50@7.75

Hogs.—Reflecting the outside situation, the market closed a trifle stronger under an advancing tendency. Inquiry was fairly normal. Westerns, as to size and quality are quoted at $11.75@11.87.

City Dressed Stock.—Every variety of choice and prime meats closed steady, trade being about normal. Steers, 11@13½c; heifers, 10½@13c; cows, 8@11c. Veal calves, 14@15c; country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@10c; extra wethers, 10½c. Spring lambs, 13@14c. Extras, 16c, Hogs 12@12¼c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., Jan. 19, 1914.

Cattle.—The supply last Monday was 125 loads. The market ruled fairly active at about steady prices on the good cattle with weight, while the light and plain grades sold lower. Quite a number of the light weight grades on sale. Heifers ruled steady on all grades. Fat cows easier on best grades, while bologna grades were higher. Bulls steady to strong. Fresh cows and springers slow and $5 to $7.50 per head lower. Today's receipts numbered 100 loads. The demand was good and the market active to stronger.

Good to choice	$8.60@8.85
Good 1,300-1,400 lb.	8.30@8.60
Medium to good 1,200-1,300 lb.	8.15@8.35
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900-1,100 lb	7.50@7.85
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700-900 lb.	5.50@6.50
Common to good fat bulls	5.00@7.50
Common to good fat cows	4.00@6.50
Heifers	5.50@7.75
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@00.00

Calves.—Receipts of calves fair, demand light and market closed 25 cents lower than Monday's opening. Arrivals today were 500 head. The market was steady.

Heavy and thin calves	$5.50@7.50
Veal Calves	9.00@12.00

Sheep and Lambs.—The supply of sheep and lambs has been fair; with a good demand the better grades of sheep have ruled steady to stronger while choice lambs ruled 10 cents per cwt. higher; other grades lambs slow. Today's sheep market was slow. Sheep were steady and lambs lower. Some 27 loads were on sale.

Prime wethers	$5.80@6.00
Good mixed	5.50@5.75
Fair mixed ewes and wethers	4.25@4.50
Culls to common	3.00@4.00
Spring lambs	5.00@8.25

Hogs.—The supply during the week has been liberal with a good demand the market has ruled stronger all week, the close for the week being 15 cents per cwt. higher on weighty grades and 20 cents higher on Yorkers and mediums. Arrivals totaled 70 double deck loads today. All grades shared a 5c advance.

Prime heavy	$8.65@
Prime medium weights	8.80@
Heavy mixed	8.70@
Best heavy Yorkers	8.80@
Light Yorkers	8.80@
Pigs	8.50@
Common to good roughs	8.25@8.50
Stags	6.75@7.25

BALTIMORE LIVE STOCK.

Baltimore, Md., Jan. 19.1914.

Cattle.—Receipts for the week, 2,740 head against 2,234 last week.

Steers	$6.25@8.50
Heifers	5.50@7.50

Pigs	8.25@8.60
Roughs	7.25@8.00

BUFFALO LIVE STOCK

Buffalo, N. Y., Jan. 19, 1914.

Cattle.—The colder weather of this week with the moderate supply gave a better tone to the butcher grades, while others were steady. On the close the market was steady for good butchers. Today's receipts were 150 cars. The market ruled steady.

Choice heavy steers	$8.75@9.00
Medium	8.00@8.65
Yearlings	7.50@8.00
Handy butchers	8.00@8.40
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.25@8.00
Butcher bulls	7.00@7.25
Feeders	6.00@7.00
Stockers	4.50@6.50
Cows and springers	30.00@90.00

Calves.—The basis was lower on the opening of the week, being $10.75@12. On the close calves sold active at $12 @12.50. Todays receipts were 800 head.

Choice veals	$11.50@12.00
Lights and thin	6.00@ 8.75

Sheep and Lambs.—The liberal supply on Monday was well cleaned up under the good demand, the basis on lambs being $8.25@8.35. Yearlings were in light supply and sold firm thruout the week at $5@7.25. Sheep were in good demand by country buyers at around $6@6.25; mixed sheep were a shade stronger. On the week's close the market was active and higher with liberal offerings. Yearlings ruled steady under a fair demand. Good mixed sheep sold at $5.25@5.75. Today's receipts were 110 cars. The market ruled lower.

Choice lambs	$8.00@8.15
Poorer grades	6.50@7.50
Yearlings	6.00@7.00
Wethers	6.00@6.25
Ewes	5.00@5.50
Sheep	5.50@5.75

Hogs.—The week opened with a very heavy run which lowered the price but the demand was good. Mixed heavy hogs ruled lower. Dairies were in fair demand at $8.25@8.50. On the close the demand was only fair and light weights were slow and easy. Yorkers were slow and lower. The receipts today were 110 cars. The market ruled strong.

Heavies	$8.65@8.70
Mixed and medium	8.65@8.70
Yorkers	8.65@8.70
Light Yorkers	8.65@8.70
Pigs	8.50@8.60
Roughs	7.50@7.75
Stags	6.50@7.25

Horses.—Some 250 head were sold this morning. With a moderate demand the top price on teams was $600, and on general purpose horses $100@175 each.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa, Jan. 19, 1914.

Hay.—While billings in transit show a slight increase, nevertheless arrivals are light and a good demand readily absorbs same, No. 1 timothy and No. 1 light clover mixed being placed readily at quotations and market is looking good. Slightly better demand for clover and heavy mixed, but scarcely sufficient to warrant heavy shipments. Off grades dull and slow sale.

No. 1 timothy	$17.50@	18.00
No. 2 timothy	15.50@	16.50
No 3 timothy	13.00@	14.00
No 1 light mixed	15.50@	16.00
No. 1 clover mixed	14.25@	14.75
No. 2 clover mixed	12.25@	13.25
No. 1 clover	14.25@	14.75
No. 2 clover	10.50@	12.00

Straw.—Demand a little better, owing to cold weather. Market slightly stronger.

No. 1 oat	$8.75@	9.00
No. 2 oat	8.00@	8.25
No 1 wheat	8.25@	8.50
No 2 wheat	7.75@	8.25
No. 1 rye	9.00@	9.50
No. 2 rye	8.50@	9.00

Ear Corn.—Receipts moderate, demand active. Market stronger.

New No. 2 yellow	68½@69c
New No. 3. yellow	65½@69c

Shelled Corn.—Receipts light and demand fully ample to take care of same.

New No. 2 yellow	70½@71c
New yellow No. 3, natural	68½@69c
New sample	64 @66c

Oats.—Demand for oats improved; receipts rather light. Market better.

No. 2 white	43 @43½
Standard oats	42¼@42½
Standard No. 3 oats	41 @41½

Mill Feed.—Bran in good demand, middlings dull.

No. 2 white midds, 100's	$28.00@$28.50
No. 1 brown midds, 100's	26.00@ 26.50
W. W. Bran, coarse, 100's	25.50@ 26.00
W. W. Bran, medium, 100's	24.50@ 25.00

NEW YORK LIVE STOCK.

New York City, Jan., 19, 1914.

Beef Cattle.—Receipts for week 3,000 head. Market firm.

Steers	$8.00@9.00
Bulls	5.50@7.75
Cows	3.75@6.50
Dressed beef	12¾@14c.

Calf receipts 2,000 head. Market steady.

Choice	$8.50@13.00
Culls	7.00@ 8.00

Dressed Calves higher. Dressed veals, 15@19¾c.

Sheep and lamb receipts 11,300 head. Market lower.

Sheep	$3.75@5.50
Culls	5.50@6.50
Spring lambs	6.75@8.35

Hog receipts 10,400 head. Market steady. Choice, $8.60@8.75; roughs, $7.50@7.75.

VISIBLE GRAIN SUPPLY

New York, Jan. 19.—Visible supply of grain: Wheat decreased 1,392,000 bushels; in bond decreased 434,00. Corn increased 1,068,000. Oats decreased 1,006,000; in bond increased 263,000. Rye increased 9,000. Barley decreased 484,000; in bond decreased 63,000.

GRASS SEED MARKET

Toledo, O., Jan. 19.—Cloverseed.—Prime cash, and January, $9; February, $9.07½; March, $9.02½; April, $8.62½. Alsike.—Prime cash, $10.80; March, $10.90. Timothy. — Prime cash $2.47½; February $2.52½; March, $2.55.

CHICAGO HORSE MARKET

Horses were marketed too liberally last week, and after early sales at firm prices, there was a weakening in common and medium grades. Sales of horses were largely at $150@225 per head with few going as high as $265 and the better class of heavy drafters scarce and firm at $275@350. Inferior animals were poor sellers around $75@125. and farm geldings sold mainly at $140@210, with farm mares taken usually at $160@220, while some farm teams were purchased at $315@425.—F.

NEW YORK HAY MARKET.

New York City, Jan. 17, 1914.

The hay market was quiet and steady on all grades today. Receipts were 429 tons. Timothy, No. 1, $1.07½ bale; standard, $1.05 No. 2 $1.00; No. 3, 85c; clover, 65@97½c

Straw.—Straws remains generally quiet Receipts nominal. Oats straw 50@55c bale; rye 80@85c.

ELGIN BUTTER QUOTATION

Elgin, Ill., Jan. 19, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 32@32½c a pound.

TOBACCO MARKET

Tobacco growers were mystified by the operation of a strange individual of prepossessing manners who located at a leading hotel and announced thru local newspapers that he would "be able to procure tobacco growers a higher average price for future crops" and that it "is very necessary that you come at once." The stranger gave his name as R. L. Kimbrough and intimated that he was from the blue grass region of Kentucky. Interviewed as to who he represented he was non committal. He insisted that his mission was in the interest of growers but denied that he was a philanthropist. He laid great stress upon the success of Kentucky growers in pooling their interests and said that warehouses would be established and tobacco be held for better prices.

This man and his methods are at least worthy of investigation and, if found sincere of serious consideration. While it is probably true that he is a promoter working for personal interest, this by no means precludes the possibility of the worth of his plan to the growers. It is no aim of the writer to commend or condemn the man but if he has a plausible plan to better selling conditions and if this plan is modeled along lines that have been successfully followed in other sections, it is altogether possible that he should have attention. It is imperative, however that no contracts be signed until all are satisfied as to the identity and sincerity of the soliciting party.

The regular monthly meeting of the Lancaster County Tobacco Growers' Association was largely attended. Statements made there showed that but little of the new crop has been sold. Many offers of $8.50 and $9 per cwt. have been refused. In other places some sales have been made at from $8 to $10 per cwt. In one community a Wisconsin buyer paid as high as $11 per cwt for best crops. The superior quality of the new crop was generally attested by those present Stripping is now in full season and growers are also planning for the crop of the present year.

The general tobacco market was quiet and steady with a liberal inquiry for all classes of tobacco. The demand for binder leaf is urgent and unsupplied. Pennsylvania tobacco was noticeably higher and manufacturers were at a loss to know where to get supplies of this tobacco to last until the new crop is of suitable age for use.—H. J. Tweed, Jan. 19, 1914.

SAVE-THE-HORSE (Trade Mark Registered.) BOOK FREE

Why We Make a Contract to Cure

Mr. W. C. FRALEY, 502 Fisher St., Salisbury, N. C., Mar. 27, '13, writes: I used 2 bottles and cured two horses and one pony of bone spavin two years ago and they are sound as a dollar.

FOUR YEARS AFTER—STILL SOUND

Mr. H. G. PUTNAM, dealer in Coal, Danvers, Mass., Oct., 6, '13, writes: Four years ago I sent for Save-the-Horse for thoroughpin and made a cure. The horse has done a good day's work almost every day since on coal wagon.

WE ORIGINATED the plan of treating horses Under Signed Contract to Return Money if Remedy fails. You risk nothing by writing; it will cost you nothing for advice and there will be no string to it.

OUR LATEST Save-The-Horse BOOK is our 18 Years' Discoveries—Treating Every Kind Ringbone—Thoropin—SPAVIN—and ALL—Shoulder, Knee, Ankle, Hoof and Tendon Disease—Tells How to Test for Spavin; how to locate and treat 58 forms of LAMENESS—Illustrated.

OUR CHARGES for Treatment ARE MODERATE. But write and we will send our—BOOK—Sample Contract and Advice—ALL FREE to (Horse Owners and Managers—Only).

TROY CHEMICAL CO. 70 Commerce Ave., Binghamton, N. Y.

Colic Kills 2000 Horses

That number died of colic in New York City alone last year. Colic comes suddenly, and if not attended to immediately with the right remedy, kills quickly. Our colic compound cures in 15 minutes. Easy to give, and animal is soon ready for work. Have it on hand. $1.50 per bottle, guaranteed. Dr Holland Company, 117 Water St., Boston, Mass.

Horse overshoes that are sharp-shod for icy weather. Buckled on in one min. Let us send you 1 or 2 sets C.O.D. by Par. Post, $3 per set delivered. Extra treads with sharp calks 30c. each, guaranteed to prevent slipping. Live agents write for circular. Herman Mfg. Co., 1420 Pa. Av., Washington, D. C.

HORSE LAME? Use KINDIG'S Famous OINTMENT. A sure cure for bone, bog, and blood spavin, ringbone, curb, soft bunches splint, etc. 50 cents, postpaid. E. Kindig, Jr., Remedy Co., 4836 Woodland Ave., Phila.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also name and address of writer. Initials only will be published. When reply by mail is requested, it becomes private practice, and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Cow Pox.—Have a cow that has a breaking-out on bag. Some of the pimples are as large as the end of finger, and contain pus. I have given her some remedies which fail to help her. M. E. T., Bridgeville, Pa.—Give your cow a dessertspoonful of powdered nitrate of potash at a dose in feed, 2 or 3 times a day, and apply 1 part oxide of zinc and 3 parts vaseline to sores and sore parts, once a day. Another inexpensive solution that has given me splendid results is made by dissolving 4 oz. hyposulphite soda in a gallon of water and wash the udder, 5 or 6 times a day. This solution will usually check and destroy the infection. Of course, it is needless to say that this disease is readily communicated from one animal to another if the milker is careless.

Worms—Colic—Weakness.—I have a mare, 9 years old, that had an attack of colic sometime ago and was sick about three hours. While treating her for this attack, I discovered that she had worms from 6 to 8 inches long. I gave her treatment for them, but she is still unthrifty and when worked perspires very freely. She has a ravenous appetite, but appears dull and dumpish. She has been short winded for some time. C. E. W., Huntingdon, Pa.—Her teeth may need floating. Give her 1 dr. ground wormseed, ½ oz. ground gentian and 1 dr. ground nux vomica at a dose in soft feed, twice a day. Also salt her well and feed her some carrots. She should have some exercise every day and be well fed.

Urinary Ailment.—I bought a heifer at a cattle sale shortly after she had been shipped from N. Y. and examined at Lancaster Stock Yards by state authorities and pronounced sound. After I got her home, I discovered that she was passing matter or pus with a small quantity of urine. She eats fairly well but is not thriving. O. N. K., Mount Pleasant Mills, Pa.—Give your heifer 60 grains urotropin and 1 oz. of bicarbonate soda at a dose in feed, 3 times a day. Also give her 1 dr. ground nux vomica at a dose in feed, twice a day.

Cow Coughs.—I have a cow that has been troubled with a cough for sometime and I would like to know what to give her? E. E. M., Ransom, Pa.—Give her ½ oz. ground ginger, 1 oz powdered licorice and a teaspoonful muriate of ammonia at a dose in feed, 3 times a day.

Capped Elbow—Stomach Vertigo.—I have a mare 12 years old, that has swollen chest. She also has a gristle or thickened skin on elbow. I also have four pigs about three months old. They were apparently in good health when I fed them. Then they reared up and staggered back; also put their head against anything they ran into. R. M., Big Pool, Md.—Apply 1 part iodine and 10 parts fresh lard to swollen chest and elbow callous, 3 or 4 times a week. Your pigs may possibly choke or a spasm of the throat may take place and tumble them down, or they may have stomach vertigo. I suggest that you feed them warm food and arrange it so that they cannot gulp too much at a time. If they stagger, give each one 10 grains potassium bromide at a dose, 3 times a day, and enough castor oil or epsom salts to clean out their stomach and bowels.

Lameness.—I have a 9-year-old horse that has a peculiar lameness. When taken out of stable he may go sound for 5 or 6 miles, then suddenly goes lame in fore legs. His fore feet are decidedly flat. Can you tell what is laming him? E. N. R., Andover, N. J.—It is possible that the lameness comes from soreness in foot, caused by him stepping on a rolling stone, cinder, or hard substance of some kind, causing foot soreness; or, he may strike shin with opposite foot. Dissolve 1 oz. acetate of lead and 2 oz laudanum in a quart of water and apply to shin and coronet, twice a day. Also apply leather sole, filling bottom of foot with pine tar and oakum.

Genasco THE TRINIDAD-LAKE-ASPHALT Ready Roofing

When you want all the buildings on the farm waterproofed to stay—cover them with this genuine asphalt roofing, applied with the Kant-leak Kleet.

Genasco gives real resistance to snow, rain, sun, wind, heat, cold, and fire; and the Kant-leak Kleet waterproofs seams without cement.

Ask your dealer for Genasco. Mineral or smooth surface. Look for the hemisphere trademark.

400,000 Settlers a Year

Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent,

The NEW Edison Phonograph (Mr. Edison's *Latest* Invention) Now Shipped FREE!

An offer introducing ***The New Edisons.*** Write quick—*while this offer lasts.* Edison's new phonograph—*just out!*—the perfected musical wonder of the age!

WRITE *today* for our *new* Edison catalog—the catalog that tells you all about the wonderful *new* model Edison with Mr. Edison's *new* diamond point reproducer—the new parlor grand style. It will also tell you about **our *new* Edison offer!** Now read:

The Offer:

We will send you the *new* model Edison Phonograph and your choice of all the brand new records on an **absolutely free loan.** We want you to hear all the waltzes, two steps, vaudevilles, minstrels, grand operas, the old sacred hymns, every kind of comic and popular music, also your choice of the highest grade concerts and operas, as rendered by the world's greatest artists. Entertain your family and friends. Give plays and concerts right in your own parlor. Hear the songs, solos, duets and quartettes, the pealing organs, the brass bands, the symphony orchestras, the choirs of Europe's great cathedrals, the piano and violin concerts, virtuoso—all these we want you to hear free as reproduced on the new Edison. ***Then, when you are through with the outfit, you may send it back at our expense.***

Remember, not a penny down—no deposit—no guarantee—no C.O.D. to us—no obligations to buy—**a full free trial** in your own home—***direct*** from us—***direct*** to you. Returnable at our expense or payable (if you want to keep it) at the actual rock-bottom price direct from us.

The Reason:

Why should we make such an ultra-liberal offer? Why should we go to all this expense and trouble just so **you** can have all these free concerts? Well, we'll tell you: we are tremendously proud of this magnificent new instrument. When **you** get it in your town we **know** everybody will say that nothing like it has ever been heard—so wonderful, so grand, so beautiful, such a king of entertainers—so we are pretty sure that at least some one, if not you, then somebody else, will want to buy one of these **new style** Edisons, **especially as they are being offered now at the most astounding rock-bottom price and on easy terms** as low as **$2.00 a month.** But even if no one buys, there is no obligation and we'll be just as glad **anyway** that we sent you the **new** Edison on our **free** trial; for that is our way of advertising quickly everywhere the wonderful superiority of the **new** Edison.

Mr. Edison's Pet and Hobby

among all his wonderful inventions is his phonograph. He worked for years striving to produce the most perfect phonograph. At last he has produced this new model. Think of it: over 25 years of work on all these epoch-making inventions—then his pet and hobby perfected!

Endless Fun

Happiness is life—and real happiness is found only in a real home where the happy and united family gather together for mutual enjoyment and recreation. Do you realize how a phonograph will enliven a home, will remake a home?

Such a variety of entertainment! Hear the latest up-to-date song hits of the big cities. Laugh until the tears stream down your face and your sides ache from laughing at the funniest of funny minstrel shows. Hear the grand old church hymns, the majestic choirs sing the famous anthems just as they sing them in the cathedrals of Europe. Hear the pealing organs, the crashing brass bands, the waltzes, the two-steps, the solos, duets and quartettes. You will sit awe-stricken at the wonderful grand operas as sung by the world's greatest singers. You will be moved by the tender, sweet harmony of quartettes singing those old melodies that you have heard all your life. Take your choice of any kind of entertainment. All will be yours with the Edison in your home. **Send the coupon today.**

ESTABLISHED 1880 PUBLISHED WEEKLY

VOL. 35—No. 6. PHILADELPHIA, PA., SATURDAY, FEBRUARY 7, 1914. 2 YEARS FOR $1.

Lime and Soil Fertility.

By John H. Voorhees,
New Jersey Experiment Station.

There are several substances commonly used by farmers as manures, which produce desirable effects upon the crops, altho they are not plant foods and only act indirectly on the soil either by making it more amenable to cultivation or by bringing into action the stored-up reserves in the soil. One of the most important of these substances is lime. The use of lime is a question which confronts every farmer at some time during the year. In order to understand the problem of its usage thoroly, there are a number of factors which every farmer must understand. He must know whether he needs lime, how much he needs, what kind of lime to purchase, and when to apply it. And furthermore, a knowledge of the advantages of lime and its action upon the soil must be known.

Why Apply Lime.—The most important reason for the use of lime is, perhaps, the correction of an acid condition so commonly found in soils. Most upland plants require a sweet soil and thrive best in a soil free from acid. The application of lime is a means of creating conditions in our soils favorable to the growth of plants, and the correction of acidity is but one of the factors influencing the condition of the soil. Lime liberates plant food by aiding decay, and assists in the formation of nitrates. This has its apparent dangers and advantages. One may readily note that it is dangerous to apply lime to a soil containing large quantities of humus or organic matter when there is no crop present to use the plant food liberated from that humus or organic matter. On the other hand, it is beneficial to have some substances which will liberate plant food in the way which lime does.

In the case of soils having a liberal supply of humus, it is sometimes advisable to hasten nature's action of liberating plant food for the use of the growing plants. This is often true with market garden crops. Often the sweet potato grower makes use of this principle. Aside from these advantages, lime improves the physical and mechanical condition of the soil. Upon sandy soils its effect is to fill up the openings which make them more adherent and more retentive of moisture. On clay soils the effect of lime is still more important; the fine particles are separated and the soil made more open, porous and friable; air and water circulate more freely; the soil is warmer and easier to work.

Soils often contain numerous bacteria which aid the farmer where legumes are grown by gathering nitrogen from the air and in good soils filled with humus these minute organisms aid in transforming organic nitrogen to an available form. Conditions created by the application of lime are favorable to the spread and multiplication of these bacteria. With these numerous advantages, and importances, the problem of the application of lime becomes one worthy of consideration.

Where to Apply Lime.—In answer to the farmer's first question, whether his soil needs lime, it is known as a result of work of experiment stations, that a large proportion of our soils east of the Mississippi are in need of lime. This is so because lime is readily soluble and is washed out of soils by the drainage water aside from being used by some plants as food. But if the farmer is to answer this question himself, he must understand his soil. Then, too, there are a number of plants, most of them weeds, which thrive in acid or sour soils. Common among these are the sheep sorrel or sour grass, daisy, wild strawberry, etc. These plants are merely indications of an acid condition existing in the soil, but considerable reliance may be placed upon them. I have always felt that Joseph Wing's method of determining whether a soil needed lime was practical. Mr. Wing takes with him a bottle of muriatic acid and a tumbler. When going thru a field he will put some soil in the tumbler and add to it a small amount of muriatic acid. If lime is present in the soil, a chemical action takes place and bubbles are given off. If no lime is present in the soil, there is no chemical action and no bubbles are given off. These are, perhaps, only suggestions regarding a method to determine whether a soil needs lime.

LOADING "POMONA FRUIT FARM" PEACHES FOR A 20-MILE AUTO-TRUCK HAUL TO MARKET
On the S. H. Stanger Farm, Gloucester Co., N. J.

How Much Lime to Apply.—The next question, how much lime a soil needs, is a difficult one. Laboratory tests may be made to determine how much lime is needed by any particular soil but all of us have not this acquisition, so that we must depend upon our knowledge of the soils and the statements in the preceding paragraph which are indications. Experience has shown, however, that soils of run-down farms will often require as much as three and four tons to correct acidity alone.

Kinds of Lime to Apply.—The purchase of lime will depend upon three factors at least; first, the cost of actual lime contained, delivered at the railroad station; second, the cost of handling after the lime has been delivered at the railroad station, and third, the fineness of division. I might add further that the crop to be grown and the soil, will influence slightly the answer to this question. It is further necessary to understand each of these factors upon which the purchase of lime depends. The actual lime contained will, of course, vary with the kind. I presume the best known kind of lime is that which is taken from the hills of northern New Jersey, New York, Delaware, Maryland and Pennsylvania which occurs in these states as limestone and carbonate of lime. Years ago the farmers themselves burned this lime and then slaked it with water and added it in the slaked form to the soil. This lime is on the market today as burned lime or lump lime and is, perhaps, the purest form of lime. Each 100 pounds will contain 90 pounds of actual lime, allowing for impurities.

The second kind of lime upon the market today is that which has been taken from the hills and ground by powerful machinery. One hundred pounds of this lime will contain about 50 pounds actual lime, allowing for impurities. Hence, there are two kinds of lime derived from the limestone quarries. Analogous to these kinds, we have burned oyster shell lime and ground oyster shell lime. Aside from these we have hydrated lime or the burned lime, to which water has been added. This lime is generally known as slaked lime and each hundred pounds will contain about seventy pounds of actual lime, allowing for impurities. With these figures, any farmer can determine for himself the amount of actual lime contained.

The cost of handling is a factor which every farmer must determine for himself. This will depend upon the distance from the railroad station, upon the kind of lime he is purchasing, and his facilities for spreading. Of course, the burned lime or lump lime must be slaked after reaching the farm, and this is extra labor. Some manufacturers have facilitated the use of burned lime by grinding it and calling the product ground burned limestone. This is a good form of lime but the prices [illegible] are usually too high. [illegible] lime or burned limesto

This Little Girl Had A Spinal Deformity

Little Miss Taylor had Potts Disease, a progressive, destructive disease of the spinal column, usually tubercular, and often accompanied by paralysis. The trouble in this case had been in existence three years when her mother, Mrs. W. S. Taylor, R. F. D. No. 2, Clinton, Ind., brought the child to this Sanitarium, Feb. 22, 1910. At that time, because of the disease and deformity of the spine, the child's head was forced forward—her chin in contact with her chest.

This picture, recently taken, shows her condition and appearance at this time. Write Mrs. Taylor. *In treatment of this case plaster paris was not used.* The

L. C. McLain Orthopedic Sanitarium

is a private institution, devoted exclusively to the treatment of crippled and deformed conditions, especially of children and young adults.

Write us freely regarding Club Feet, Spinal Diseases or Deformities, Infantile Paralysis, Hip Disease, Bow Legs, Knock Knees, Wry Neck, etc. We will send you descriptive literature and advise you fully. Ex-patients as references everywhere.

Eureka Send for Catalog—FREE

Potato Planter

Profitable for the large or small grower. Plants potatoes at lowest possible cost. One man operates it. Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if wanted)—covers up—marks the next row. Accurate, automatic and dependable. Sold with or without Fertilizer Attachment.

Here's why you should select the Eureka Potato Planter:—Furrow Opening Plow is directly under the axle—that means uniform depth at all times. The seed drops in sight of driver. Steel and malleable construction makes long life and few repairs. Made in three sizes—for one or two rows.

We also make the Eureka Mulcher and Seeder. Shipped from branch near you.

EUREKA MOWER CO., BOX 755, UTICA, N. Y.

Horse overshoes that are sharp-shod for icy weather. Buckled on in one min. Let us send you 1 or 2 sets C.O.D. by Par. Post, $3 per set delivered. Extra treads with sharp calks 30c. each, guaranteed to prevent slipping.

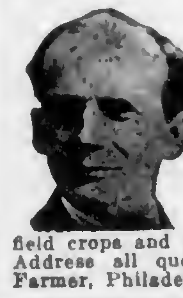
Live agents write for circular.

Herman Mfg. Co., 1420 Pa. Av., Washington, D. C.

the fineness of division is usually considered good and the resulting product is quick acting, especially if the product is pure. On the other hand, there is considerable debate regarding the fineness of division of the different grades of ground limestones and their relative value. I believe that the farmer should insist upon a ground limestone, finely divided, but unfortunately, the farmer has no way to tell how fine the limestone is and must depend upon the guarantee of the man from whom he purchases.

Time of Application.—The time of application will depend largely upon the nature of the farming. The potato grower should apply lime directly after digging the potatoes and before seeding hay in a rotation of corn, potatoes and hay. The general farmer practicing a five-year rotation of corn, oats and Canada field peas, and hay or alfalfa, should apply lime directly before planting the hay or alfalfa, and the same is true with the farmer practicing a rotation of corn, oats, wheat or rye, and hay. In this case, however, the lime would precede the wheat or rye crop because it is the general practice, altho not always a good one to seed hay in the grain. With the market gardener and orchardist, the problem is slightly different. Often the labor supply will determine the time of application. The market gardener may, however, apply any form of lime during the winter provided there is some growing crop upon the soil, altho the best practice is to apply the lime to the raw soil previous to planting some crop. In such cases when lime is applied to raw soil, it should always be worked into the surface with some good farm tool.

Farm Crop Notes



By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

More Criticism

One of our leading weekly magazines quotes the London Times as saying, "the American farmer is very nearly the worst in the world," and this it says in summarizing, "in spite of the lavish expenditure of the United States on Agricultural Colleges and the exceptional advantages of soil and climate. He settles on land as locusts settle to devour everything before him, and move on." The Times is further quoted as saying, "We are told that the American farmer gets less than half of what the consumer pays for the produce they raise, while their political influence is strikingly disproportionate to their economic importance." The article pertinently points out that "agriculture is the only industry in America that is still unorganized."

The American farmer has been meekly submitting to a great deal of harsh and unjust slurring during recent years, often by those who eat their bread by the sweat of his brow. The London Times has evidently been reading some of this one-sided gossip written by ill-informed critics on this side of the Atlantic.

The American farmer has not so nearly exhausted the natural resources of the soil by wasteful methods in all the generations he has tilled it as have the men controlling the other natural resources,—coal, forests, gas, oil, iron, etc. This is not given as an excuse for the mistakes in management made by farmers, but to call attention of men engaged in other callings that when the sins of exploitation have to be answered for, the farmer may be found the least guilty of all.

The inference to be drawn from much of the criticism intended to show the incapacity of the American farmer is that he is culpably ignorant and inefficient and not able to compete with admittedly less intelligent farmers on the other side. It is often pointed out that we are producing only one-half or one-third as much per acre as is produced by many other countries, yet the fact is not noted that if these same countries had to pay American wages, as much as we do for machinery, etc., their wheat would cost them three dollars per bushel and other products in proportion. Labor is the cheapest thing they have; here land is the cheapest and labor the most costly. Men engaged in other business have so controled affairs and developed an economic system that makes other productive industries so profitable that they can pay wages that the farmer could not pay, nor could they be paid by farmers in any other nation. The greatest need the average American farmer now has in order to increase production is sufficient labor.

Farmers would be willing to pay wages equal to those paid in other vocations if their business would afford it. It is not alone because they do not know how to increase production that they can not pay them. However large or however small their yields, there is an army of go-betweens to fatten—the buyers, the wholesalers, the retailers, the manufacturers, yes, and those who lawfully gamble in the necessities of life, taking much and giving nothing, withholding from the farmer and exacting high tribute from the consumer, the profits making the boasted American fortunes and providing luxuries as well as necessities that the great majority can not have—these have developed an economic condition that must be corrected before there can be general prosperity in agriculture, no matter how expert individual farmers may become.

We recognize the truth of the last two statements of the English paper, the unjust proportion of the consumer's dollar received, and also that, as a class we have not cut much figure in politics and in the adjustment of economic affairs. Both of these conditions are largely due to the lack of organization. Self-protection demands organized effort—a unity of thought and action that will equalize profits, taxes, labor. Agriculture and all that it means, business, life, home, must be considered the unit, not individual farmers. The work must be led by leaders who are big enough, broad enough and honest enough to guard it against exploitation of outside interests.

Farmers are beginning to ask why those who are supposed to be leaders in the work of developing a better agriculture are avoiding some parts of the work that are mighty important. This question must be answered sooner or later. Tradition teaches us that real leaders, those who will be found in the work at the end, will be those who have helped in developing both individual efficiency and social co-operation.—R. P. K.

INSTITUTES IN INDIANA COUNTY.

The Institutes held in Indiana County, beginning Dec. 29, 1913 and closing Jan. 8, 1914, were a great success, both in attendance and interest. I note in the Pennsylvania Farmer, issue Jan. 10th, that a series of meetings held in eight places in Lancaster County had a total attendance of over 7,000 people. Lancaster County had 14 days of Institutes, and in Indiana the 10 days of Institutes had a total attendance of over 7,000. Each session was carefully counted by J. T. Campbell, leader of the section and S. C. George, County Chairman. The meetings and total attendance were as follows: Smicksburg, 900; Marion Center, 2,500; Willet, 1,400; Brushvalley, 1,250; Lewisville, 950. Average attendance for each session, 280.

When we take into consideration that Lancaster County is by far the richest agricultural county in the state, and has an energetic and untiring Chairman, these figures are surprising. Indiana is listed lower as an agricultural county. It is broken by steep hillsides and narrow valleys. Some of the farmers have received as much as their farms are worth for the coal and gas, and there are a number of abandoned farms. But there are a number of good farm buildings and modern homes with natural gas for light and heat. The farmers are wide awake to everything that means better agriculture. Soil fertility and dairying interest all the men. The young men and boys asked pertinent questions on these subjects. The women are interested in the home problems and poultry. There were written questions galore and each speaker was held on the floor with oral questions until full time had been consumed.

I believe from the interest taken in the silo, milking machines and feeding problems that this county is going to come to the front in dairying and hustle Bradford County to hold first place. Mr. George, the County Chairman, has his institutes well in hand. The best order prevailed. I think that I voice the sentiment of all the state workers when I say that it was ten days of strenuous work after which it was hard to say goodbye to Mr. George and Indiana County.—Leon O. VanNoy, Bradford Co., Pa.

Lowest Price Ever Quoted on STEEL Shingles

Write us the dimensions of your roof and we will make you a price on the complete job that will simply startle you. For we not only manufacture the finest of STEEL Shingles, but our prices, quality considered, are lowest. Made so because we sell direct to users and because we now have 125,000 customers. Even if you've only a small shed to roof, don't fail to get our offer. We positively guarantee to save you big money.

Edwards STEEL Shingles

do not burn or rot or rust. Far outlast ordinary wood, prepared paper, composition and corrugated steel. Come in big sheets, hence very easily put on. No painting, no special tools, no expert workmen.

Edwards STEEL Shingles won't rust. First, because Edwards, by his famous "Tightcote" Process, dips each sheet of steel in melted zinc *after* cutting. Thus the edges, as well as sides, are rust-proof. Other makers don't go to the expense of galvanizing the edges. Second, Edwards protects each nail hole, by a close-fitting over-lap. (See picture at left.) No chance for rust to get a foothold. This is Edwards' Interlocking Process, the patents for which are valued at $100,000.

Freight Paid

The price we quote includes the freight; in fact, it's the entire, total cost of a new roof. It is the *lowest* price ever made on a good roof. Just get it. Then see if any other concern can sell so low.

If we could only print the price here, we know we would win you. But that's not possible, because raw steel goes up or down every few days. And that, of course, changes our price. Just now raw steel is not advancing, so our price on Steel Shingles is very low. Write at once and get the benefit of present prices.

If you can't give dimensions of your roof, write us on coupon below and get prices. Ask for booklet 251

1913 RECORD

Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Horticulture

PENNSYLVANIA HORTICULTURISTS MEET

The proceedings of the 55th annual meeting of the State Horticultural Association of Pennsylvania, held in the city of York, on January 20, 21 and 22, were of unusual interest. The lack of the usual State appropriation had but little effect. The association did not have the benefit of lectures from a distance, but it had the benefit of the experience of a number of its own members, who were on the program, and of addresses and discussions, by members of the State Department of Zoology and of the faculty of the agricultural school at the Pennsylvania State College.

The use of the Court House was granted by the Commissioners of York County for the several sessions. Hon. W. T. Creasey, president of the Association, called the opening meeting to order with brief remarks, and then introduced Mayor John R. Lafean, who welcomed the association to York, R. J. Walton, first vice president, responding to his remarks.

The first business was the report of the General Fruit Committee, which was presented by the chairman, Dr. David E. Murray, of Columbia County. This report was very comprehensive, giving data and statistics concerning the fruit results in Pennsylvania in 1913. It showed that the average of yield of apples was 30 percent of a full crop. Neglect more than climatic conditions affected the yield. Poor quality has been the result of poor practice. Prices of apples in the State ranged from 25 cents a bushel to $1.25. To get the higher prices growers should endeavor to produce quality rather than quantity. It has been demonstrated that the diseases which attack the fruit can largely be prevented by spraying with lime-sulphur, either self-boiled or diluted concentrate.

Planting in 1913 increased about 5 percent over 1912. There is little danger of over-planting because the demands for good fruit are becoming more critical with each year. Quality will rule, and the poorer kinds will be eliminated from the market.

This report also showed that on account of late April and early May frosts the peach trees suffered and there was but a 15 to 20 percent crop. Elberta, Iron Mountain, Early Crawford, Champion, Oldmixon and Smock were the varieties which gave the best crops. Peaches ranged in prices from 80 cents to $1.75 per basket. The average was $1.00.

The insects most harmful in the peach orchards were the borer and curculio. The diseases most prevalent are yellows, leaf curl and brown rot. Trees affected with yellows should be destroyed at once. Leaf curl can be prevented by spraying with lime-sulphur solution (1.03 strength) just before the leaf buds open. For brown rot spray with Bordeaux mixture of the 3-4-50 formula.

Pears suffered by the late spring frosts almost as much as apples. Blight is destroying from 15 to 20 percent of the pear trees every year. There was a 10 percent crop of sweet cherries and a 60 percent crop of sour cherries. The plum crop was ruined by the late spring frosts. Grape production and nut culture are two industries almost wholly neglected in Pennsylvania.

Raspberries and blackberries were about a 20 percent crop, due to frost damage and cane blight. Strawberries gave a 40 percent yield. The report concluded as follows:

"Pennsylvania is a great state, great in every particular. We have developed her various industries. Let us now place her on the horticultural map, leading in every line of our calling. It can be done."

In discussing the report, Prof. J. P. Stewart, of State College, spoke of the Baldwin apple as being less resistant of frost than some other varieties. The Northern Spy, on account of being a late bloomer, is more likely to escape frost damage.

Dr. H. A. Surface declared that the vitality and the condition of the trees counts for much in their ability to resist frost.

P. S. Fenstermaker, of Lehigh County, claimed that elevation has much to do with the question of frost resistance.

"The Bush Fruits" was the topic presented by Prof. Walter B. Nissley, of State College, in a short talk. He expressed surprise that more attention is not given to the berry crops in Pennsylvania, which possesses soil so well adapted to them. The growing of small fruits, he said, has increased, due to the improved varieties, modern methods of handling and better shipping facilities. It is well to go back to nature in selecting a site for bush fruits. Have soil that is well-drained but retentive of moisture. Do not fertilize too heavily, as too much fertility produces too much wood growth. Prof. Nissley gave the following list of the best varieties of raspberries: Cuthbert, Loudon, Columbia and Marlboro (reds); Golden Queen (yellow); Gregg, Diamond, Eureka and Cumberland (blacks). Also, he gave the following list of blackberries: Eldorado, Snyder, Taylor, Erie and Wilson. His selections of currants are Red Cross, Perfection, Victor, Fay's Prolific, Red Cherry, Wilder and Black Champion. His gooseberry favorites are Downing, Chautauqua, Houghton, Industry and Red Jacket.

James M. Moore, of Bucks County, gave a short talk at the evening session on "Ornamental Planting for the Farm House." He spoke of the necessity of keeping the surroundings of the farm home attractive and showed what an expenditure of $50 will accomplish toward this end. The general plan outlined was as follows: Let there be a border to the farm yard. Have a good hedge around the lawn. The Japanese maple is one of the best ornamental trees. The clematis paniculata is a desirable vine for porches. For a border eight feet wide, use altheas for the background, next some medium-sized shrubbery, and then rows of peonies, iris and daisy in front.

Dr. H. A. Surface spoke on "Increasing the Quantity and Developing the Quality of Fruit," and at the close of the session showed some lantern slide views of twelve species of scale parasites that he has been observing for four years. His remarks on producing sought to show that quality does not mean large size, but freedom from blemishes, from marks of insects and the presence of color.

Prof. C. R. Orton, of State College, followed with an illustrated lecture on "Some Fruit Diseases and Their Treatment." He showed on a large screen conditions of fire blight, twig blight, body canker, collar blight, bitter rot, apple scab, cedar rust and leaf rust. For all blighted limbs and twigs and cankered conditions, he advised cutting out the affected parts, observing care as to the sterilization of the instruments used.

Howard A. Chase, of Mount Pocono, opened the proceedings of the second day by giving instructions as to "How to Plant a Tree." He produced two young apple trees, which he proceeded to prune according to his methods, giving his reasons for the different cuts. He recommended pruning so as to produce low-headed and open trees, by the elimination of central leaders and the cutting the side limbs to outer buds so as to develop a lateral growth.

C. A. Griest, of Adams County, followed with a talk on "Planting and Care of a Young Peach Orchard," laying stress on the importance of the selection of a proper location. He recommended an elevated situation with good drainage (both water and air). Peaches will succeed on any soil on which chestnut trees will grow. He advocated the "straight row" method of planting, so that the orchard can be cultivated in four directions. He advised diligence in spraying, and emphasized the efficacy of lime and sulphur as a spray.

H. F. Hershey, of Harrisburg, spoke on "Peaches for the Home Market." He recommended this list of varieties, which he gave according to their order of ripening according to his experience: Greensboro, Art Beauty, Carman, Mountain Rose, Belle of Georgia, Champion, Elberta, Late Crawford, Smock and Salway. Dr. I. H. Mayer, Lancaster County, recommended the addition of Fox's Seedling and Iron Mountain (both white peaches) to this list.

J. A. Runk, of Huntingdon, took the floor as a substitute speaker on "Some Phases of Management in the Commercial Apple Plantation." He alluded to the difficulties which confront the beginner especially the obtaining of suitable trees. Soil conditions, air, drainage and other branches of the subject in planting an orchard were considered. Frost immunity was cited as being of more importance than frost protection. As to whether too many trees are being planted, Mr. Runk expressed it as his belief that the grower of the future is

Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters

often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "*100 Per Cent Potato Planting*" and copy of Iron Age Farm and Garden News.

BINKS SPRAYERS

CROP PROFITS depend largely on how the crops are taken care of. Every time you fail to spray your crops when spraying is essential it is virtually money lost.

BINKS SPRAYERS often pay for themselves from the profitable results attained from the first operation. They are substantially made of the best possible materials with all brass working parts and contain nothing to get out of order.

the man who can control his crop after it has been harvested.

The opening of the "Question Box" resulted in answers to a number of questions.

"Marketing Fruit in Family Packages" was the topic of a talk by Howard A. Chase. He referred to the shipment of fruit to commission men, and the losses sustained by growers in striking a glutted market. He advocated the establishement of a "Bureau of Information and Distribution" as a branch of the Department of Agriculture of Pennsylvania, whereby the producers can be brought in touch with the buyers and consumers.

The business session Wednesday evening was open only to members. Amendments to the constitution were adopted doubling the cost of membership, which hereafter will be as follows: annual membership, $2.00; life, $20.00. The meetings are to be open only to paid-up members, their wives, daughters and minor sons, and to delegates from associations outside of Pennsylvania. The election of officers resulted as follows: president, Chester J. Tyson, Flora Dale, who was formerly secretary; vice presidents, Dr. I. H. Mayer, Willow Street; F. H. Fassett, Meshoppen; W. J. Lewis, Pittston; secretary, J. A. Runk, Huntingdon; treasurer, Edwin W. Thomas, King of Prussia.

Contributions were received for the hanging of a portrait in oil of Gabriel Hiester, a former president of the association, in the Agricultural Building of the Pennsylvania State College.

F. H. Fassett, of Meshoppen, gave a talk on "Cover Crops for the Orchard." He recommended oats as one of the best cover crops, and spoke highly, also, of the merits of hairy vetch and crimson clover. A combination crimson clover and orchard grass he declared is suitable for a hillside, to prevent washing.

D. N. Minick, of Chambersburg, read a short paper, protesting against the McKellar cold storage bills, pending in Congress, the passage of which, he said, will totally ruin the apple trade.

The "Question Box" occupied the remainder of the session.

To open the afternoon session Dr. J. P. Stewart gave "Some Points on the General Care of an Apple Orchard," and spoke of some of the diseases of apples, especially the "Baldwin Spot," which affects a number of varieties.

He then gave the following list of apples for southern Pennsylvania and the lower altitudes of central Pennsylvania:

Summer varieties—Yellow Transparent, Early Ripe, Oldenberg, and either Primate or Benoni; fall varieties—Summer Rambo, Smokehouse, Maiden's Blush; winter varieties—Grimes' Golden (on Paragon stock) Jonathan (as a filler), York Stripe, Stayman Winesap, Rome Beauty, York Imperial, Paragon; the following were recommended for northern Pennsylvania and the higher altitudes of the central counties: summer varieties—Yellow Transparent, Oldenburg, Red Astrachan; fall varieties—Wealthy, Mackintosh, Smokehouse, Opalescent; later varieties—Rome Beauty, Baldwin, Northern Spy, Stark. For Baldwin the Pewaukee can be substituted.

W. J. Lewis, of Pittston, who has 87 varieties of apples in his orchards, stated that according to his experience hardly any varieties are exempt from the "Baldwin Spot."

Prof. F. N. Fagan, of the Pennsylvania State College followed in an address on "Selecting and Keeping Exhibition Fruit." The specimens should be fair types of the soil and locality in which grown, said Prof Fagan. Attention should be given to uniformity of size and shape, as well as to color. The careful handling of the fruit is an important matter. Until the time of the exhibition the fruit should be kept at an even temperature.

The Committee on Resolutions—F. H. Fassett, Cyrus T. Fox, A. I. Weidner, W. J. Lewis and George H. Bartram—reported late in the afternoon.

The resolutions commend the Department of Agriculture and its Division of Zoology for its important work in the cause of horticulture; extol the Pennsylvania State College; express disapproval of the portion of the new law of weights and measures which fixes the weight of a supposed bushel of apples at a greater figure than the actual weight of a full bushel; recommend suitable regulation by law of the commission business in agricultural products; request the Department of Agriculture to prepare a bulletin on the utilization of waste orchard fruits; and convey the thanks of the association to the York Chamber of Commerce and the Mayor of the city for favors conferred and to the press for the excellent reports of the proceedings.

At the evening session Prof. A. W. Gilbert, of Ithaca, N. Y., delivered an illustrated lecture on "Some Plant Breeding Lessons," and gave views of the production of vegetables, plants and flowers under glass.

Professor R. L. Watts, Dean of Agriculture at State College, delivered the closing address. His subject was "Agricultural Education." He reviewed some of the work of the State College, and spoke of agricultural instruction work in the public schools.

Two special sessions for vegetable growers were held at the Colonial Hotel, Wednesday, January 21st. At the morning session Prof. W. B. Nissely of State College spoke on "Some Special Problems" and H. C. Thompson, of the Bureau of Plant Industry, Washington, D. C., on "The Use of Muck Soil in Vegetable Forcing." In the afternoon, Mr. A. M. Seabrook, of Bridgeton, N. J., discussed "Irrigation as a Factor in Vegetable Growing," followed by a round table on vegetable varieties conducted by Dean R. L. Watts, of State College.

The fruit show in the Coliseum Building was most creditable, considering the fact that no cash premiums were awarded. A fine display of Stark Delicious apples by the Stark Bros Orchards and Nurseries Company was a very attractive feature. The Perry County Fruit Growers' Association won first prize for the best county association exhibit. The Adams County Society was a close second. There were sixteen classes and many individual exhibits, representing a number of counties of the State. H. M. Keller, of Gettysburg, won the prize for the best collection of five barrels of apples, any one commercial variety. He exhibited Staymen Winesap. He also won first premium for the best barrel of this variety. G. P. Myers, of Aspers, took first prize for the best barrel of York Imperials, with Kauffman & Sons, of York, second.—Cyrus T. Fox, Berks Co., Pa.

Renovating Apple Trees.—The question of renovating old apple trees is being given considerable attention all over New Jersey. Most of New Jersey's farms have orchards of dilapidated apple trees, some of which have passed the century mark. These trees in themselves are practically worthless so far as the fruit they produce is concerned, but under the proper treatment they could be restored to a state of profit again and be enabled to produce much good fruit. The sod about them should be plowed. Then the trunks should be lightly scraped to remove the loose, shaggy bark. Next cut out the dead and diseased wood, and give the tree a light pruning, after which heavily manure the land. The next step in this process of renovation is to give the tree a thoro spraying of lime-sulphur wash or a soluble oil solution. Whenever this treatment has been given, it has been found that the health of the tree has been wonderfully increased, but of course, since the trees are apt to belong to some obsolete variety, it is a good plan to topgraft the larger limbs with desirable varieties. The grafting process is not to be performed until spring, but the scions should be cut now. In cutting grafts, take pieces of wood from 6 to 12 inches long, of this season's growth from bearing branches of trees known for their desirable sorts and productiveness, and store them in barrels of sand placed in the cellar. Grafting should be well and carefully done, and if one is not acquainted with the process, an expert would better be employed. Then good results must be patiently awaited. One of the best known scientific apple growers of New Jersey, emphasizes the fact that it sometimes takes three years to rid an old, unsprayed orchard of the different pests. He states further that many orchardists look for results the first year, but that this is impossible, since only a beginning of the fight against insects and diseases has been made in that time.—D. T. Hendrickson, Monmouth County, New Jersey.

Imported Cabbage Worm and Cabbage Aphis.—A circular on this topic, No. 28, of the Montana Station should be of interest to many farmers of this and other states who are troubled with these almost universal cabbage pests. This circular gives descriptions of these pests and their injuries to the plant, with illustrations showing them in their different forms, and then outlines control measures. The Bulletin is mailed from Bozeman, Mont.

Cutaway (CLARK) Disk Harrows Work Up The Soil Finer Than Other Harrows And Are Lighter Draft

For more than a quarter century we have been making CUTAWAY (CLARK) disk harrows for men who want to till their land more thoroughly, more intensively, than is generally practised. Today CUTAWAY (CLARK) implements are the standard of real worth. They are constructed with utter disregard of the designs followed by makers of other disk harrows. They are built to pulverize the soil finer than other harrows will do, and to do it without increasing the draft. We make

OVER 100 STYLES AND SIZES

of CUTAWAY (CLARK) disk harrows and plows. We have one for every farmer whether he has but one small horse or a large tractor engine with which to pull it. Tell us what your needs are and we will tell you about the tool best adapted for them. If you believe in more intensive tillage of the soil, then you believe in CUTAWAY (CLARK) implements. Ask the CUTAWAY dealer in your town to show you a CUTAWAY (CLARK) disk harrow or plow. If we have no dealer there, write to us for catalog. We ship direct where we are not represented by an agent. Don't accept a substitute.

Write today for free book "The Soil and Intensive Tillage"

Our booklet, "*The Soil and Intensive Tillage*," illustrates CUTAWAY (CLARK) tools and contains ten pages of valuable information on the soil—its chemical and physical properties—the feeding of plants, and intensive tillage. There is also an article by Professor G. B. Upton of Cornell University on the CUTAWAY (CLARK) Forged-edge Disk.

THE CUTAWAY HARROW CO., 983 Main St., HIGGANUM, CONN.

Planet Jr.

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. It is light, handy, and adapted to use by man, woman, or child. Has leaf guard for close work, and a durable *steel* frame.

Nearly two million soil-tillers all over the world are saving time, lightening labor and getting better results by using Planet Jr guaranteed farm and garden tools. For all requirements, $2 to $100.

FREE Our new 72-page illustrated catalogue describes 60 tools for *all* kinds of horse and hand cultivation. Write for it today.

S L ALLEN & CO
Box 1202E Philadelphia

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

This is a practical every day time-, labor-, and money-saver. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel-cultivator, and a rapid and efficient wheel garden plow. Every owner of a vegetable garden can save the cost of this tool in a single season.

No. 76 Planet Jr Pivot-wheel Riding Cultivator, Plow, Furrower, and Ridger

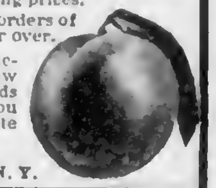
A wonderful implement in extensive cultivation of corn, potatoes, etc. Light in draft, simple and strong in construction and comfortable to ride upon. Works rows 28 to 44 inches, and cultivates crops until 5 feet high.

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. It has steel frame. The plow opens furrows for manure, seed, etc., and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.

No. 72 Planet Jr 2-row Pivot-wheel Cultivator, Plow, Furrower and Ridger

Cultivates at one time two rows of potatoes, corn, beans, etc. in rows 28 to 44 inches apart. Works like a charm in check rows, crooked rows, and rows of irregular width. Can be equipped with roller-bearings, spring-trip standards, and discs.



FRUIT TREES AT HALF AGENTS' PRICES.

The Dingee & Conard Co., Box 227 West Grove, Pa.

The Dairy

FORAGE CROPS FOR THE DAIRY FARM

(Third Prize Article)

Dairy feeds are expensive to buy at present prices and prospects are for still higher rates. Feed bills eat a large hole in dairy profits. The best way to conquer this condition is to grow such feeds as can be grown on the farm which will go the farthest toward making up a balanced ration for the dairy cow, with the smallest possible outlay for purchased feeds.

To do this the silo and growing of alfalfa will be found two important factors. I think one is about as important as the other. The silo furnishes one of the best known dairy feeds at present. Besides providing the most profitable way of handling the corn crop, it furnishes a palatable and succulent feed for the dairy cow. On account of its succulent qualities, silage keeps the bowels of the dairy cow in good order. Without silage, bran or oil meal is used largely to perform this function. Both of these are expensive feeds to buy, and run up the feed bill rapidly if fed to any extent. This fact alone makes silage an important home-grown dairy feed.

Another important factor in favor of silage is that it can be held for feeding during the summer and fall months, and makes a most excellent substitutes for the green pastures which are generally found waning more or less at this time. There is something peculiar about silage. It is more palatable to stock, and gives better results than feeding green corn from the field during the fall when pastures are short. I fed silage to my cows all thru the drouth last summer. Some mill feeds were fed with it to furnish protein and balance the ration. Had I had plenty of alfalfa hay to feed with the silage, a considerable portion of my mill feed bills could have been eliminated.

Protein is the element generally lacking in home-grown rations. Plenty of good alfalfa hay will go a great way toward furnishing this important element, and avoid purchasing large quantities in mill feeds, as it contains about 11 percent of digestible protein. Few farmers realize that soy bean hay contains about the same amount of digestible protein as alfalfa hay. Oat and pea hay is another containing about half as much. The main trouble is that many of us farmers have silage to feed, but not any of the high protein hays mentioned to balance the silage with protein as much as possible. We have to get the necessary protein from some source and so have been buying it in mill feeds.

A 1,000-pound cow giving about thirty pounds of fairly rich milk is supposed to require a daily ration which will furnish her about twenty-five pounds of dry matter, two and one-half pounds of protein and about thirteen pounds of carbohydrates. To show how near we can approach a balanced ration for dairy cows by having plenty of silage and alfalfa hay, or other legume hay containing a similar amount of protein, I have compounded the following ration. This ration is for a 1,000 pound cow. For smaller or larger cows the ration can be varied about one-tenth for every 100 pounds difference in weight, either way.

lbs.	Dry Matter lbs.	Dig. Pro. lbs.	Dig. Carb. lbs.
40 corn silage	8.40	.36	5.16
15 alfalfa hay	13.80	1.65	6.34
2 corn and cobmeal	1.70	.08	1.20
1 cottonseed meal .	.92	.37	.17
	24.82	2.46	12.87
Standard ration	25.00	2.50	13.00

Only two pounds of corn-and-cob-meal and one pound of cottonseed were required in addition to the silage and alfalfa hay to bring the above ration within a very small fraction of the standard. Most farmers who have silage to feed have some corn besides, only a small amount of which would be required to furnish the amount of corn-and-cob-meal called for in the ration for a good size dairy. It is probable that if the silage was made from well-eared and well-matured corn that the two pounds of corn-and-cob-meal could be left out on account of a larger amount of corn in the silage. The above ration is based on medium grade silage.

In the above ration only the one pound of cottonseed meal is supposed to be purchased. For a dairy of fourteen cows on full feed, only about one-hundred pounds of this would be required per week. The cost would be only a fraction of the cost of mill feeds purchased by many farmers for a dairy of this size where plenty of alfalfa or other legume is not available to form part of the ration. Cottonseed meal was used in the ration mostly to help balance the shortage of protein. It will be noticed that the alfalfa hay alone furnishes about two-thirds of the protein called for.

All dairy farmers should recognize the great feeding value of legume hays. More or less nitrogen is stored in the soil where legumes are grown, and the land is greatly benefitted. Common red clover is a valuable legume, but contains only about two-thirds as much digestible protein as the other three legume hays mentioned above. Where alfalfa can be grown it is the leader of the legume hays, in that much larger amounts can be grown per acre on account of its tendency to grow several crops in one season.

When protein must be purchased, cottonseed meal is the cheapest form. There is an opinion among some farmers that it is not a safe feed for cows. At the Connecticut Agricultural College it has been fed continuously for many years, and no bad results have been detected. Some received as much as six pounds per day of this meal, and were never off feed.—C. R. Weidle, Erie Co., Pa.

ROTATIONS FOR DAIRY FARMS

The success of many a dairy herd is more dependent upon the ability of the owner to raise food crops than upon the ability of the cows as heavy producers. Economical substitution of home-grown foods must be practiced to meet the present prohibitive prices of grain and by-product feedstuffs.

In our efforts to produce better home-grown foods we find that the questions of feed and fertility are, in a measure interdependent; that is, the more fertile the land the larger the crops, and the more cows can be kept and the more manure will be made. The growing of food crops brings more land under a profitable system of crop production, and this means better crop rotations, better cultivation, the constant occupation of the soil and a consequent natural increase in fertility.

Growing suitable food crops for the cows also helps build soil fertility. It is true that the more rich feeds there are purchased and fed the more fertility is added to the farm to balance up whatever may be removed in the sale of dairy products. On the other hand, the man who grows clover, alfalfa and other legume crops adds nitrogen to his soil as well as to his dairy foods, and the soil will gain materially in fertility provided provision is made to balance up the farm manure with phosphorus and potassium. In addition to furnishing nitrogen, both to the dairy foods and the soil, the legume crops are active factors in stimulating the activity of soil organisms which help to release insoluble mineral elements that otherwise would be unavailable to growing crops.

The man who has good pasture land is fortunate, altho it is possible to establish pasture by seeding with a variety of grasses that will yield feed thruout the season. Such a pasture will require several years to become well established. The weeds must be kept down and grass seeds sown on thin spots. Where the seeding is thin and run out in spots I have secured good results by applying 30 bushels of lime, 300 pounds of acid phosphate and 100 pounds of sulphate of potash to the acre, disking thoroly and seeding mixed grass seeds for several years. I think it is better to seed the grasses several times than to apply the seed all at one time.

In reference to growing food crops I have confined all of my efforts to such standard crops as clover, alfalfa, oats and peas and corn. The more we can raise of these crops the better. With these crops a man can run his herd and buy very little grain, and that only of the most concentrated sort. In growing food for cows that are producing market milk, I practice a four-year rotation of corn, oats and peas, clover and timothy. Some prefer the three-year rotation and leave out the timothy, but on account of the uncertainties of the clover crop I prefer the mixed mowings and allow them to occupy the land two years. This gives an ideal place for the farm manure and furnishes a better base of humus to work with.

DE LAVAL
Butter Triumphs as Usual At National Dairy Show

BUTTER made from cream separated by De Laval Separators made the usual clean sweep of all highest awards at the great 1913 Chicago National Dairy Show and Annual Convention of the National Buttermakers' Association, just as it has always done every year since the organization of the National Association in 1892.

Whole Milk Creamery Butter. The highest score in this class was awarded to O. N. Peterson, of Rapidan, Minn., a De Laval user, as were 187 out of the 200 whole milk creamery entries.

Gathered Cream Creamery Butter. The highest score in the gathered cream factory-made butter class was given R. O. Brye, of the Readstown Creamery Co, Readstown, Wis, this prize-winning butter being made from the cream of farm patrons all using De Laval Separators.

Farm Dairy Butter. The highest score in this class was awarded to Mrs. D. H. Turnbull, of Monmouth, Ill., whose family has been using De Laval Cream Separators for over twenty years.

De Laval Superiority Indisputable. The evidence of the superiority of De Laval cream and butter as demonstrated by the winning of all highest awards the world over for thirty years, is so overwhelming as to be indisputable and unanswerable. A De Laval catalog, to be had for the asking, will make plain the reasons for it.

Away With Churns!
Use the "Fayway"—Get More and Better Butter
Stop Old-Fashioned, Wasteful Churning!

$1.00 Brings It

This marvelous machine is NOT A CHURN—it's a BUTTER MAKER! Does the work in half the time of the best churn. Gets MORE butter and BETTER butter from the same cream than by any other known process. The greatest MONEY MAKER for farmers and dairymen ever introduced. Makes your butter bring more per pound!

Revolutionizes Butter Making!

Fayway Butter Separator

The "Fayway" System produces butter by an entirely different process—no "whipping" or "beating" with paddles or blades. A stream of air blows the billions of butter globules to the top—gets ALL the butter-fat!

Made in 3 Sizes

How It Works Just pour in the cream, turn the crank a few minutes and—presto!—there's the butter! Actually fun to make butter with the "Fayway"—all drudgery abolished!

Amazing Results "Fayway" butter has a beautiful waxy texture. Tastes better, keeps longer, brings 5c to 10c more per pound than ordinary "churned" butter, and you get more of it.

Our $1.00 Deposit Trial Offer
We don't ask you to take our word. We want you to SEE with your own EYES how the "Fayway" makes butter. Send for our $1.00 Deposit Plan on which we will ship this amazing machine for a free trial in your own home. If it doesn't do exactly what we claim, back comes your dollar! Don't send any money, but

Write for Free "Fayway" Book
This book tells all about the FAYWAY the greatest invention since the cream separator was brought out. Let us tell you about Fayway Butter Clubs.

THE BLANTON & McKAY CO., 437 Carr Street, Cincinnati, Ohio

Alfalfa helps out wonderfully in balancing up the rations. It will succeed almost anywhere that red clover will. Lime, drainage and humus will overcome most of the troubles and put the land in shape for this crop. I have secured a good stand on ten acres. It requires patience and perseverance to grow alfalfa, but it is worth trying for.

Corn silage is the best succulent food we can raise. It is not necessary to discuss this food further than this: You and I know that in the summer we can not get a heavy milk yield if we feed timothy hay, and yet a chemist will analyze grass and cured timothy and find that they are the same thing, only more water is in one and the proportions slightly different. You and I know the value of them as a food. The man who, during six months of the year depends upon dry timothy hay, does not get enough succulence, does not get that element which is in the grass, unless he has some kind of succulent food, and there is no succulent food that one can raise as cheaply as silage from matured corn, sowed thin, cultivated cheaply and stored properly. A silo will pay for itself the first year, in the excess of food value obtained by taking care of the corn in that way against the ordinary method of caring for it. One can not afford to lose sight of succulent food in making up dairy rations.

We should strive to improve our standard feed crops before trying to find new crops to take their places in the rations and rotations. There is as much difference in the quality and value of home-grown foods as in the feeds of commerce, and it should be our aim to grow, harvest and feed these crops in the best possible condition. Those crops which should be grown on the farm to build up fertility produce a class of feed needed to balance up the ration for milk production. In short, we must provide some kind of succulent food thruout the year, cheapen the cost of protein and increase the fertility of the soil. If we are to grow better feed and fertility crops, as I see it, we must grow better corn, clover, alfalfa, oats, and peas; the mixed grain crop, clover and alfalfa to take the place of grain foods and give us cheaper protein.

This brings up another question. Our home-grown feeds are bulky. There is a limit to the capacity of the cow's stomach and the energy she must employ in keeping it working. If we choke the machine we cut down its capacity. To reach the digestive and assimilative capacity of our cows they must be furnished with the required amount of fats, carbohydrates and protein in about the right proportions. The excessive amount of dry matter contained in our standard food crops renders it impossible, without the aid of concentrated feeds, like linseed oil meal, cottonseed meal and similar food, to reach the digestive and assimilative capacity of the cows. In other words, the cow is not capable of eating, digesting and assimilating a sufficient quantity of these domestic feeds to enable her to produce a maximum flow of milk.—W. Milton Kelly, Erie Co., N. Y.

THE COST OF RAISING A DAIRY COW

One of the most important and vital problems in the dairy industry is the production of heifers to replace poor animals and the older cows as they reach the end of their economic usefulness. Bulletin 49 of the Bureau of Plant Industry says that there are in this country, not including the Philippine Islands, 21,749,651 dairy cows. Considering the average productive life to be even as high as eight years, each year 2,718,706 heifers must be raised to maintain the present number of dairy cows. If the total number of cows is increased, then even a larger number of heifers must be raised annually.

The raising of these heifers for the country as a whole is an important economic problem to the dairyman, and the cost of their production is a large item in keeping down his profits. In the new bulletin is outlined the cost problem of raising a heifer, and figures are presented showing the results of investigations into the cost of producing heifers on a Wisconsin farm, covering a period of five years. During this period 117 Jersey calves were selected for raising. While the cost of raising dairy cows of the different breeds may not vary greatly, the Jersey is one of the smallest breeds; and if there is any variation the cost for the other breeds would probably be a little higher.

In computing the cost of producing a dairy heifer consideration has been

SHARPLES MILKER
Easy to Clean
Easy to Keep Clean

"They are easy to take care of," writes one SHARPLES MILKER user, whose name we will be glad to furnish on request. "When we get through milking we milk a pail of water through them, the machine is cleansed in water about scalding, then placed in a solution of lime water.

"The machines do not hurt the cows. We have used them eighteen months. To anyone in the dairy business I would recommend them. We are milking around seventy cows daily in an hour and ten minutes. We use five units.

"One man attends to the milkers and another man strips the cows. The cows like it better than hand milking and it does away with the labor problem. I had to keep eight and nine men on my farm, but after pay day we might have one or two to do the milking. It just made things hum for the foreman and one or two men that would be regularly on the job. Now we are under no obligations to them. Everything works smoothly and there is no friction among the men picking out the easy milkers and all those stunts."

The SHARPLES MILKER now is being used in dairies of from 15 to 700 cows. Built sturdily, its operation is alsolutely reliable.

Ask the editor of any national authoritative dairying paper what *he* thinks of the SHARPLES MILKER.

What You Do When the Pail is Full

Change the cover. Don't stop the machines milking—that would be a loss of time. Weigh and record each cow's milk—that's the Hinman way. Everything runs smoothly and silently. The first you know the milking is over.

The HINMAN Milker

Don't think that the Hinman is made only for the big farmers. It's a money maker for dairies of all sizes from 10 to 400. Every owner will tell you proudly "It's a Hinman." They milk every time—always on the job. Cheaper than hired help.

Milking in Silence Means Dollars

Cow-contentment and thoroughly scientific milking make the big records. That's why such dairymen as Jno. Garrow, Morenci, Mich., uses the HINMAN when putting his heifers through the advanced registry.

A few of the many features found only in the Hinman. Each machine separate; no vacuum in pail, rapid-pail-changing idea, visible milk flow; no piping—just a simple drive rod; only two moving parts.

Changing HINMAN Pails

Say the word and we'll mail you our catalog. It will help you to understand why the Hinman milks 65,000 cows daily under greatly varied conditions. Agents everywhere.

TRADE MARK REGISTERED
One pound of molasses to ten pounds of feed increases efficiency of ration 25 per cent. Try it. Cut price $7.00 per barrel (56 gallons), f. o. b. Pennsylvania Factory. You take no risk—money back if not satisfied after feeding half a barrel. Order quick. WATTLES & COMPANY, Box 22 Litchfield, Michigan

given to such items as feed, bedding, labor (both man and horse), shelter, use of equipment, interest on money invested, miscellaneous charges (including veterinary services, registration fees, and other minor items), a share of the general overhead expenses of the entire farm business, and a charge to cover losses by death and discarding. To these must be added the item of initial value, because a calf worth raising has a value at birth.

Summarizing the results obtained by experiments and observations, it was found: That the average net cost of a dairy heifer 1 year old is $39.52, which consists of its initial value, $7.04; feed, $24.67; labor, $4.45; other costs, $6.36; total, $42.52; creadit for manure, $3. The average net cost of a dairy heifer 2 years old is $61.41, which consists of its initial value, $7.04; feed, $40.83; labor, $7.81; other costs, $13.73; total, $69.41; credit for manure, $8.

The most important item of cost is the feed, which is 65.5 percent, or nearly two-thirds of the total cost of the heifer. Labor forms 12.5 percent, and all other costs 17.5 percent. One-half of the feed cost the first year and one-third for the full two years is for the whole and skim milk. By far the most expensive period in the life of the calf is the first four weeks, the cost being nearly double that for any other four-week period. This high cost is occasioned by its being dependent almost entirely upon whole milk. The man labor required in raising a heifer is about 40 hours during the first year and 23 hours the second year. The total cost of man and horse labor for the two years is close to $8. The manure produced during the two years has been valued at $8, consequently, the cost of labor is practically offset by the value of the manure.

If the cost of raising a dairy heifer on the Wisconsin farm is typical thruout the dairy regions, the usual price received for such heifers will not pay the cost of producing them. This is especially true of a heifer sold at one year of age. The investigations of the cost of producing a dairy heifer seem to indicate that a heifer entering the dairy herd at 2 years of age must be worth at least $60 to cover cost only. A farmer cannot afford to raise a heifer that will not sell for more than $60 at 2 years of age.

PENNSYLVANIA HOLSTEINS TO MONTANA

Mr. H. C. Reinhold, one of the leading Holstein breeders of Lancaster County, Pa., recently shipped two carloads of registered Holsteins to a breeder at Helena, Montana. The cattle reached their destination in excellent condition. A notable feature was that four calves were born during the journey, and all were saved in good condition. The western breeder is convinced that Pennsylvania has registered Holsteins lower in price, commercial value and pedigree considered, than any other state in the Union. His experience with the Lancaster County shipment has further strengthened his conviction; and the freight was but little higher than from such middlewestern states as Wisconsin, Illinois, etc.

This bears out the claims of Prof. VanPelt, of Iowa, who, in recent lectures in the East, has advocated greater attention by eastern breeders to the markets for purebred dairy cattle thruout the West. Dairy expansion has been rapid in the former range sections, and there is a big and growing market for dairy cattle of quality. Invidual breeders will do well to cultivate this trade, and communities of breeders in the East may find a good outlet for surplus stock.

Standard Seeds.—The 1914 catalog of Stokes' Standard Seeds is bigger and better than ever before. It lists a complete line of seeds for the truck garden and general farm. Do not make up your list of spring seed purchases without examining this catalog. It is free upon request. Address Walter P. Stokes, 219 Market Street, Philadelphia, Pa., and ask for Catalog 43.

Listen to the Cackling Hen
It's a welcome sound to the poultry-keeper. But all hens that cackle are not profitable layers. The laying ability of a hen depends largely upon her anatomical construction. She must be of the "laying type" regardless of the breed. Some hens will lay four times as many eggs per year as other hens of the same breed under exactly the same care and feed.
Keep Only Profitable Fowls
"The Call of the Hen" is a valuable book for every poultry raiser. It is more than a book—it's practically a course of instruction in scientifically selecting and intelligently breeding fowls. Mr. Walter Hogan—the author—gives in this book the results of half a century of careful experimenting in selecting and breeding for heavy egg production. His discoveries show that in every breed there are three distinct types of fowls—the meat, the dual purpose, and the laying type.
"The Call of the Hen" shows you how to pick each profitable layer from the rest of the flock—how to pick for breeders those that will reproduce their laying ability in their progeny.
Send To-Day For This Valuable Book
Mr. Hogan's article on "Prepotency" is alone worth many times the price, $2.00, of "The Call of the Hen." He has absolute proofs that "Prepotency" is the vital factor in breeding and his work verifies his methods and discoveries. Send $2.00 to-day—this is a straight cash offer—no premiums or other inducements—the book will prove in itself the biggest value you ever received.

Pure Bred S. C. Brown Leghorn Pullets $1.50 each. M. L. Weaver, Glenwood, Erie Co., N. Y.

Poultry

INCREASING EGG LAYING TENDENCY

Most of us want eggs summer and winter, all we can persuade the hen to lay. On some farms poultry is considered a necessary evil instead of a profitable source of income but the one who is in poultry work for profit wants a strain that will lay eleven months out of the year. It is possible to have such a strain if one goes about it in the right way.

To take a lot of mongrels and endeavor to breed so that the strain will be built up is a very slow and difficult undertaking. It would be better to sell all the old lot and get a fresh start, even if the proceeds would buy only a very small pen of a laying strain of purebred stock. It takes many years to build up a good laying strain and much care and effort. The hen in her wild state laid only a few eggs and then hatched them and raised the family, which was the natural instinct. The greatest layers have been taken out year after year and used in the breeding pens, resulting in a little better laying strain each season. Sometimes this rule meets with the reverse as in some experiments that were conducted at the Maine Experiment Station. As a general rule, however, it works well. A few years ago the 200-egg hen was thought impossible but that mark has been passed many times and a hen at the Oregon Experiment Station recently produced almost 300 eggs in twelve months.

This law of selection is a very important one to the man who tries to produce eggs the year around. It is a very simple law and consists in reserving year after year a few of the very best layers, which also have the general qualifications of the breed, and using them for breeding purposes. A small pen of 5 or 6 two-year old hens should be mated with a two-year old male, this to be from the highest record laying hen, characteristic of the breed used.

This work of increasing the yield is a very interesting study and can be practiced by any one who is a close observer of his flock. It is not absolutely essential to have trap nests but of course it would be better. One can soon have some idea which are the best layers in a pen of 5 or 6 hens and these can be set aside at the end of the pullet year for the breeding pen for the next year's work.

I have not been surprised to find that it is not always the largest hens that lay the most eggs. It has been shown that the medium-sized hen is the greatest egg producer. Of course, this rule does not always hold true, for now and then exceptions come to view but I always like the medium-sized hen as a breeder. The large-sized birds are apt to be more docile. The majority of the large-sized hens in my observation have not been as good layers as the medium-sized hen for the breed in question.

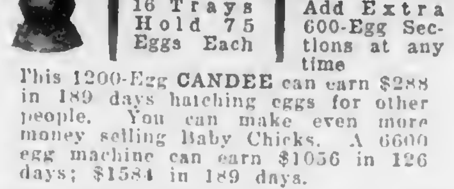
I would not use the small-sized hen for breeding purposes but would try to have as uniform a flock as possible, as to size, color and shape. The small-sized hen is not fit for the breeding pen because she is usually one that has been late hatched, or in some way stunted in her growth.

If one uses such care as is here indicated in making up the breeding pen each season, a flock of better layers ought to be secured. Each year this careful selection should be made with the idea in view of bettering the laying tendency of any breed of hens. In some parts of Kansas eggs are bought by the pound. Some day in the near future all markets will be selling eggs by weight, which will demand another line of breeding to produce larger eggs.—C. C. McCurdy, Crawford County, Pa.

TO CORRECT EGG EATING

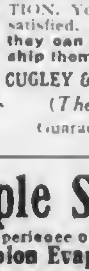
We are in receipt of a letter from Luzerne County containing a poultry pointer which we give to our readers as we got it. Our correspondent informs us that feeding fowls corn meal mixed with vinegar will prevent or correct the habit of egg eating.

Poultry Facts.—The Maine Experiment Station, Orono, Me., has just issued its Bulletin 216, which gives enlightening information on some phases of poultry lines not generally known or experimented with.



16 Trays Hold 75 Eggs Each
Add Extra 600-Egg Sections at any time

There is Ready Money in Baby Chicks
You pay about two cents apiece for hatching eggs in season; you can sell Baby Chicks for 15c apiece. Install a
CANDEE INCUBATOR
Hot Water Sectional - Automatic
—in any clean cellar or basement and you will have a modern farm machine that will produce money quick. This is a wonderful thing when you stop to think that nearly all the other products you use machines for, are not sold until fall. By selling Baby Chicks and hatching eggs for other people, you get a cash income in spring.
This 1200-Egg CANDEE can earn $288 in 189 days hatching eggs for other people. You can make even more money selling Baby Chicks. A 6600 egg machine can earn $1056 in 126 days; $1584 in 189 days.
THE CANDEE INCUBATOR IS AS SAFE AS THE KITCHEN STOVE
It doesn't cost much, and you can set it up in a few hours. The coal costs but a few cents a day. There is an automatic regulator on the heater and each 300-egg section has a separate automatic thermostat regulator. This complete regulation and the hot water heat makes stronger, sturdier chicks. These features are found only in the CANDEE INCUBATOR.
Be the one to start a Custom Hatchery Business in your neighborhood. Write us for free booklet that tells you how.
Candee Incubator & Brooder Co., Dept. Z, Eastwood, New York



TRAINED CANARIES
The Most Wonderful Singers in the World; GOLDEN OPERA SINGERS (name copyrighted). Trained in Germany to sing the most beautiful melody, and to imitate the flute, violin and beautiful bell tones. A constant delight to the whole family. Sold on
TWO WEEKS' FREE TRIAL
with an ABSOLUTE GUARANTEE of SATISFACTION. Your money back without question if not satisfied. Send for our free book that tells what they can do, how they are trained and how we ship them all over the world. Write today.

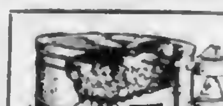
Your Name Please?
So Johnson Can Send You the Old Trusty Book
Johnson wants you to get from it the same ideas that helped half a million other people make big profits with chickens.
It will show you how easy it is to get started and how simple the work is with the Old Trusty Hatcher.
There is no mystery about chicken raising once you get acquainted with the Johnsons, and that's easy—just your name and address on a postal will do.
OLD TRUSTY
Makes biggest average hatches in coldest or warmest weather—over 80 per cent guaranteed—in every state, everywhere.
Now used by three or four times as many people as those who use any other. The reason is—the Old Trusty is simple and easy to operate and always sure of success. No highfalutin' instructions needed.
It's the highest grade hatcher made. But Johnson's direct factory price is low because he operates the largest incubator factory in the world. Every buyer saves about $5 because of this big factory.
Write your name today—get the book so you can give your income a good big boost with chickens.
Johnson pays freight and ships immediately.
JOHNSON, Incubator Man, CLAY CENTER, NEBR.



"SIMPLICITY" Combined Hatcher and Brooder
"BETTER THAN A HEN"
That is saying a whole lot, but it is true, and if you will give the SIMPLICITY a thorough trial, you will be convinced. The construction of the SIMPLICITY being round, eliminates the cold corners. Side-wall heating system assures an even distribution over the eggs. Diffusion system of ventilation is obtained by use of the open front thereby retaining the natural moisture of the egg. Automatically regulated throughout. Absolutely sanitary and odorless, fire proof. Not an experiment. Thousands of pleased customers. Write to-day for circular and get the facts of this 20th Century method.

Board of Agriculture

The meeting of the State Board of Agriculture at Harrisburg last week developed more interest in the actual every-day problems of agriculture in this state than any previous meeting. Secretary Critchfield planned the program so as to bring the heads of the various state departments before the board to tell what each was doing in matters affecting rural life and affairs. The result was that every phase of agricultural interest in which the State Board of Agriculture, as an advisory branch of the state government and official representative of the farmers of the state, is concerned was brought prominently before the members. State appropriations, roads and taxation were most prominent in the discussion. Governor Tener brought the road problem to the front in his opening remarks by calling for suggestions as to ways and means of financing road building. Incidentally the Governor offered the key to what seems the best practical solution of the problem by pointing out that the last legislature appropriated something like $20,000,000 to charities. A motion was passed providing for the co-operation of the State Board of Agriculture with the State Board of Public Charities in an effort to bring about an adjustment of appropriations. If this line of policy is followed out and a sincere effort is made to prune the list of charities that receive state aid, the present revenue will yield enough money to build roads, improve and maintain the earth roads and care for schools and all state institutions having just claims for state aid. It will not be an easy matter to compel the legislators to abandon the old policy of currying favor with home institutions by securing for them all the state aid possible, but when the public is convinced that the pruning is justified there will be such popular support for the plan that no log-rolling legislator will dare oppose it. Certainly there is no well-informed public sentiment demanding that one-fourth of the state revenue be devoted to charity. The State Board of Agriculture can be a real force in this issue and if the spirit manifested in the Harrisburg meeting animates the preparation for the spring meetings of the Board there ought to be helpful results. But the road problem can not be solved merely by appropriating more money. Dr. McCaskey, whose articles on earth road building in Pennsylvania Farmer are attracting wide attention, accepted the Governor's invitation for suggestions and made a plea for a constructive plan of earth road maintenance thru a system of King drag patrol. He advocated a system of demonstration roads in every township of the state under the supervision of the State Highway Department in much the same way that the State Board of Agriculture conducts farmers' institutes thruout the state. Unfortunately there was little opportunity found for the discussion of his suggestions, and no action was taken upon it. It must be evident to the Board, as it is to every citizen giving attention to the road situation in the state, that there must be definite plans for improvement of all roads before there is great need of increased appropriations. It is to be hoped that the Board will take up the construction end as well as the financial end of the road problem at future meetings. Taxation problems were side tracked for the discussion of appropriations and roads, but needs of revision to do away with inequalities in the present system were recognized. The entire meeting opened many ways in which the Board can be useful in helping to meet the economic needs of the farmers. The next meeting, coming at the opening of the campaign for election of legislators, should set before the public some very definite issues. A complete report of the recent meeting and a review of Dr. McCaskey's road plan will be published in next week's issue.

Carrier Outfits

A bill has been introduced in Congress to reimburse rural delivery carriers for expenses incurred in providing and maintaining their equipment used in carrying the mails. This is a feature in the development of the rural mail service which should have the support of every rural delivery patron. Under present regulations each carrier is required to provide his own outfit and maintain it out of his yearly salary. Previous to the introduction of the parcel post service this arrangement was made to serve well enough, inasmuch as the amount of mail carried per day was fairly uniform thruout the year and routes were so arranged as to avoid excessive loading. With the growth of the parcel post business, however, and more particularly since the weight limits have been increased to 50 pounds, it is imperative that the carriers be provided with conveyances that will adequately care for increased weight of mail. To require handling heavier loads the carriers can longer provide such outfits. The salaries now in force were established on the basis of service before parcel post was inaugurated and do not cover the increased work required in handling the added package mail. To require handling heavier loads and maintain the greater expense on such equipment is merely adding to a burden already out of proportion to the wages received. Country people generally are vitally interested in everything looking to the improvement of the rural delivery service. They have shown that they are appreciative of the advantages of the parcel post. They want the greatest possible development of that service. To this end they should give their support to a movement providing for proper equipment for carrying the rural mail and just reimbursement to the carriers. Automobile and trolley conveyance for the collection and distribution of city mail is provided, and many city carriers are equipped with conveyances for carrying mail. The rural carriers should be as well cared for in the performance of their duties. The new bill provides that carriers be allowed an amount equal to 25 percent of their monthly salaries for equipment and maintenance. Whether or not this is sufficient to provide the equipment necessary is a matter of detail to be worked out by the postal authorities.

Office of Marketing

Washington correspondents recently reported that Secretary Houston refused to sanction a request for $1,000,000 for the use of the Department of Agriculture in creating a bureau of marketing. He favored reducing the request to about $200,000, and declared that the latter amount ought to prove sufficient to meet the needs. The spectacle of the head of a government department refusing a large appropriation is sufficiently unique to attract attention. The more common practice appears to be for the department heads to ask for all they dare hope for and take all they can get whether they have definite plans for wise expenditures of it or not. But Secretary Houston appears to have well-laid plans as well as the temerity to refuse large appropriations. He demonstrated his general grasp of the agricultural situation in spite of lack of previous training or experience in agricultural affairs, when he declared early in his administration that the problem of economic marketing of farm crops, and the return to the farm of a larger proportion of the purchaser's price was of more immediate concern than increased production. He is letting it be understood that he does not underestimate the necessity of increased production or the utilization of a larger acreage in the production of farm crops, but he recognizes the results of better marketing systems as a means to these ends. And he appears to have personal views on the best and safest ways of working out a general marketing system. He does not favor a market bureau in his department, and hence does not want the big appropriation necessary for the establishment of such an agency. He intimates that his completed plans, which are to be announced later, contemplate rather the utilization of all of the machinery now in existence under the supervision of the department in a general market system. He says: "There must be co-operation with many other agencies. We do not want to establish an agency with an exclusive field or with barriers erected to prevent other agencies from participating in the work." We believe that every student of the marketing problem will agree with this view. Marketing is not a thing apart from farming to be referred to a special governmental bureau. It is an essential feature of farming itself, and the one feature which is most closely related to the welfare and prosperity of city and town people as well as farmers. Its problems varying in details with every locality, can not be solved by a single agency. The Secretary intimates that he is planning to make every agency under his department contribute to the work. This means that agricultural colleges, state departments of agriculture and county bureaus will be directed to give greater attention to questions of marketing, and, possibly, a compact government organization employing all of these agencies, engaged in a general plan of eliminating wastes in marketing and installing system where none now exists. There has been a growing demand for participation in this matter by the various agricultural institutions now in existence. It appears that this demand is to be met.

STATE CAPITAL NEWS

The Bushel In Question.—Next to the stirring up of the question of appropriations for public works and the administration of the Highway department by the State Board of Agriculture's open discussions, nothing attracted more attention at the Capitol last week than the criticism of the so-called "commodities act," passed by the last legislature. Members of the State Horticultural Association attacked the law in discussions and the State Board passed a resolution demanding that the law be amended in the next session. To these criticisms James Sweeney, chief of standards of weights and measures of the state, comes back with some remarks that are pertinent. He says, of course, that the law was passed for the purpose of protecting the consumer, the public, in other words. He also makes the remark that the Pennsylvania standard of weight for a bushel is the same as a number of other states notably Maryland. He says that a standard is necessary before anyone can be arrested for not giving just weight or measure and that if stroke measure should be the rule the buyer would suffer. The act in question fixes standards for some eight commodities in daily use and it is claimed that some of the standards are not fair. It may be that this law will be one of the numerous acts of 1913 which the legislature of 1915 may be called upon to change.

Demands For Amendments.—Leaving the commodities act out of the question because there may be two sides to it, there appears to be a general desire thruout the state to amend laws, especially those of 1913, altho some have really been in operation a very short time. The last three or four legislatures have been more concerned with amendatory work than anything else and in spite of the work of expensive commissions and the activities of various committees the amendments do not seem to have gained general commendation. When it is considered that the average cost of getting a law thru the legislature is nearly $100, a demand that bills be studied before being presented and that they be faithfully studied after presentation is not out of place. Some of the laws on which changes are demanded were debated for hours last session and printed time and again at a cost of hundreds of dollars and yet changes are insisted upon, loudly in some cases, when the statutes are not nine months old. The cost to the State Treasury is moreover, a mere minor consideration, when the annoyance to people about constant changes of law is considered.

Liability Law.—From all accounts the commission in charge of such matter has been faithfully studying liability laws and their effects in other States and will meet this spring to formulate a report which will be strongly urged by the governor in his message to the legislature. Judging from the remarks here last week the opposition to a law which will put the farmer and the storekeeper and the creamery owner on the same plane as the Pennsylvania railroad is as objectionable as it was a year ago. Some of our constitutional lawyers assert that the exemption of farmers or small manufacturers can not be undertaken altho if that cannot be accomplished it is rather difficult to see how domestic service was exempted.

The Road Drag.—If it should happen that the State Highway Department should not take steps to give supervisors and property owners practical instruction in the use of road drags, as suggested by Dr. Donald McCaskey at the meeting of the State Board of Agriculture, this branch of practical instruction may be undertaken as part of the educational work of the Department of Agriculture. The officials of this department are naturally not much inclined to take up work which is the special province of the Highway department, but it could be added to the "curriculum" of the farmers institutes, if one may call it such, in the winter illustrated lectures and men could be engaged, if funds held out, to give practical instruction on roads in the spring. And it might be added that such instruction would be just as much a part of the educational work for the farmers as the teaching of drainage and water supply by the farm counsellors, altho such things are the main business of a state commission with broad regulatory powers. If the Highway department can not find the funds for practical instruction with the many road drags which are owned by the State and scattered thru the State they might be lent to the Agricultural department and men employed out of the contingent fund to instruct folks on country lanes, not embraced in the main highway system. The hiring of men from contingent funds is by no means a lost art on Capitol Hill and perhaps the auditor general would be lenient if some contingent funds should be consumed for so laudable a purpose as instruction in maintaining a road until the elder statesmen work out a plan for permanent improvement. The State department of agriculture has been demonstrating marked progressiveness lately and here is another chance.

School Code Next.—State School directors will hold the fort in this city the latter part of this week and it will be interesting to watch the way the school is handled. Thanks to an administration policy of discouraging amendments to the school code last session that monumental piece of legislation was untouched and a general disposition to allow it to work out was manifested, altho unhappily this seems to be passing away now. The school directors were the opponents of much of the legislation three years ago and some wanted to change things last session. No crying abuses have been heard of and it is to be hoped that instead of radical changes the directors will give attention to the opportunity of equalizing the educational advantages so that rural districts may give more to the people who live in the country.

Sidings And Stations.—Just how far duty to the public requires the placing of stations and sidings or how far their maintenance extends to railroad companies, is to be determined by the Public Service commission this winter. Complaints involving closing of stations or location and the right to siding facilities are before that body and it will shortly lay down the law. These are two propositions which concern the dwellers in the country more than anything else except rates and it is to be hoped that a general order will soon be issued establishing regulations which everyone can understand at a glance and which railroads must follow.

Compulsory Law Enforced.—It is rather gratifying to find that among the 2500 school districts of Pennsylvania but one has been found which does not enforce the compulsory education law. Indeed, judging from the remarks of State officials, the education law of the commonwealth has ceased to be regarded as compulsory, but education as something which the child has an inherent right to demand. Unfortunately the archaic system of making appropriations in Pennsylvania is as inadequate for education as it is for highway development, but perhaps better times are coming.—Hamilton, Harrisburg, Pa., February 2 .

NEW JERSEY FARM NEWS

Corn Contests.—There will be corn contests again this year for the boys in nearly every county in the State. Several new ideas have been developed. Aiming to make the boys in the corn growing contests true missionaries of better farming, the Burlington county agricultural contest committee announces plans for organizing many local corn clubs thruout the county, using former contestants as group leaders to encourage and direct recruits. The committee will conduct potato and poultry raising contests in addition to the corn-growing, which continues the big feature, and other branches may be added. The work will be under the direction of the Burlington county Y. M. C. A., the county board of agriculture, county board of education, and the granges. With these will be affiliated the Burlington county mothers' clubs, the latter directing the contests for girls in sewing, cooking and other domestic branches. County superintendent Jason S. Hoffman has announced another corn growing contest to be conducted in Hunterdon county during the present year. The plan for this year will be similar to that conducted during the past year when about 70 contestants were entered. It is expected that more than twice as many will take part in the contest this year. A local bank has donated $100 which will be distributed in different prizes. Corn growing contests having proved so successful in neighboring counties, the school principals of Warren county have decided to start similar contests this year. The various schools will be grouped into districts. Prizes will be awarded in each district for the best ears, best stalk, best yellow dent, best white dent, and the best essay on the subject. Then the prize winners in each of these districts will be entered in the county contest for the Grand Prizes. These awards will be made next November.

Farmers' Institutes.—Farmers' institutes have recently been held at Flemington, Stockton and Roseland, in each instance under the auspices of the local grange and in the grange hall. The addresses were by noted experts and covered about every conceivable phase of agriculture. The institute season in the State is now about over. The season's work has been very successful and the farmers have learned much that will conduce to larger profits and more comfortable living.

New Taxation Bills.—So far, fifteen bills designed to bring about a general revision of the tax laws of the State have been introduced in the Legislature. According to these bills, the property in the State for the purposes of taxation is divided into five classes: Railroad and canal property; property of public utilities; property used in the business of a bank, insurance, safe deposit or trust company; all other personal property and all other real property. It is provided that hereafter all personal property, structures or other improvements erected, earth elevations, grading, draining, or other

changes in the natural formation of land, all shall be exempt from taxation. This act shall not become operative until adopted by the voters of the municipality or taxing district. Another bill provides for the abolition of the State board of assessors and vests all the taxing power in the board of equalization of taxes.

State Treasury Deficit.—Since the passage of the so-called "Seven Sisters" the laws which drove thousands of corporations from this state, thereby greatly reducing the income from such sources, the receipts of the State treasury have been falling off. The decrease is also largely accounted for from the fact that the allotment of railroad taxes to counties for school purposes has hitherto been included in the balance. Because this matter was held up in the courts, there were two such payments made in a single year, which accounts in part for the large increase in disbursements. In order to meet the requirements of the budget it will be necessary to levy a State tax unless the greatest economy is practiced. Governor Fielder, however, has plans for reducing the running expenses of the State, as well as for consolidating several departments and commissions which will save a large sum of money.

Automobile Legislation.—Because of the heavy automobile traffic within the confines of this State, and because of the fact that the widest reciprocity is extended to automobilists from all other States, there is demanded every year a constantly increasing sum to keep the roads in repair. To obtain this increased revenue, Commissioner Lippincott, of the State Motor Vehicle Department, recommends that the present schedule of fees, which are lower than those exacted in most of the States, be repealed and that a charge of sixty cents a horse-power be substituted. The change will not materially increase the burden of the automobilists. An alternative recommendation is made that automobiles be exempted from taxation as personal property, and the rate per horse-power be fixed at one dollar. This latter plan will insure the State a revenue of at least $1,500,000 from automobile registrations, instead of $750,000 estimated. One-third of this amount he would divert to the State fund for general uses, tho it is undoubtedly a fact that the whole of it can be used to advantage in repairing our roads. As before mentioned, a State tax may be necessary, Comptroller Edward's report showing a deficiency of about $500,000 for the present year. The adoption of the Lippincott recommendation will about balance the books.

War On Farmer-Agent.—A great many farmers in this state are amused at the action of the Pennsylvania and New Jersey Retail Implement and Vehicle Dealers Association, whose recent convention at Philadelphia went on record as being in favor of extracting a pledge from wholesale houses to refuse to sell direct to farmers unless they are legitimate agents. The delegates who led the fight to prevent the farmer from becoming an implement agent take the stand that if the practice is continued scores of legitimate salesmen will have to resign their positions. My own experience is that farm machinery, etc., is better sold thru the farmer-agent than any one else. It is the same way with fertilizers. The farmers who hold agencies are, as a rule, prominent men in their respective communities. Being large purchasers, they know which is best and others buy on their recommendations. Besides, they extend a line of credit, which farmers could not enjoy if they purchased from unknown or non-sympathetic salesmen.

Other School Items Of Interest.—State School Commissioner Kendall claims that absenteeism among the pupils of the public schools caused a waste last year of $1,000,000. The cause of this is the fact that for every day a child attends a public school, the State pays ten cents to the district in which that child resides. As men who believe that five months in the year is enough for any child to go to school compose a majority of the boards of education in the country, refuse to enforce the compulsory attendance laws and will not employ an attendance officer, what is to be done about it, if the State does take a hand in the game!

Fish And Game.—The report of the State fish and game commission contains the following data: Fish distributed in State's waters during the past year total 4,000,000; efforts to raise birds at game farm at Forked River proved successful; increase in brook trout crowds the hatchery at Hackettstown; licenses for 1913 amount to $83,062; hunters killed 109 buck deer.—D. T. Hendrickson.

Works for 15c Day
Whether pumping water, running washing machine or vacuum-cleaning outfit—or doing ALL THREE at once.
Haines 1½ HorsePower Air-Cooled ENGINE $26.50
High in Efficiency—Low in Price
Fully guaranteed against all defects in material or workmanship. Costs about 15c for gasoline and oil a day; 3¾ inch bore, 4-inch stroke, 40-lb. fly wheels. Speed, 425 revolutions per minute. Floor space needed, 24x48 inches. Weight, 230 lbs. Best little 1½ H. P. engine on market. Always "on the job." Offered now at Haines special factory-to-you price, $26.50 f. o. b. Camden, N. J. In writing ask for engine No. 8N200. Orders by mail filled immediately.
Satisfaction Guaranteed or Money Refunded.

Live Stock

AMERICAN BERKSHIRE CONGRESS AND LIVE STOCK BREEDERS ASSOCIATION MEETING

The eighth annual American Berkshire Congress meeting and sale of purebred swine was held at York, Pa., January 20 to 22. The meeting was held in conjunction with the Pennsylvania Breeders' Association. This meeting and sale was the most successful ever held from the point of view of attendance and interest. It was the first Berkshire Congress meeting held in the East and the results will do much to stimulate greater interest in Berkshire breeding and the swine industry thruout the East. The program offered was excellent and was furnished by some of the best Berkshire men in the country.

The session opened with a joint meeting to hear the reports of the officers and for the appointment of committees. The first discussion was on "Experiences in the Show Ring" by E. J. Barker, of Thorntown Indiana. Mr. Barker said that his show ring experience had been a very useful means of advertising his herd. He believed that there were not enough exhibitors of Berkshires and, hence, the breed was not so popular in some sections of the country. He advocated publishing the judges' names in the premium list. His advise to beginners was to be satisfied with the judging and to find out why certain placings were made, so as to profit by experience gained. He discussed briefly the fitting of hogs for the show ring, stating that the feeds used by him were milk, wheat middlings and corn, supplemented by tankage if the milk could not be obtained. His practice was to feed all they would clean up, twice daily, and be ready for the next feed. In fitting animals, get them started early to have them in good condition at time the show circuit opens. Handle carefully during the fall to keep them in the highest condition and bloom. He advocated very light feeding and no feeding at all while the hogs are shipped as they can be taken to the fair grounds in better condition than where they are fed on the road. He had never known of a boar being injured by over-fitting. Every show animal should be a regular breeder if properly handled on their return from the show circuit.

A GOOD TRIO OF BERKSHIRES FATTENING ON H. O. HOLCOMB FARM, CRAWFORD CO., PA.

Herd Boar and Sow.—Wyman Lovejoy, of Illinois, discussed "The Selection, Feed and Care of the Herd Boar and Brood Sow." It was principally along the line of selection of proper foundation stock, getting well-bred animals, and the best individuals that means will afford. He desires animals with a good wide forehead, strong back, long, smooth and deep sides, with well-developed hams. When breeding stock of such conformation is selected the breeder can make no mistake in starting a desirable herd.

Responsibility of the Seller.—Dr. Valley Hawkins, of Pennsylvania, gave an interesting address on "The Responsibility of the Seller." He considered this the most important part of the swine business in order to make it a permanent business and to make it popular. The seller should always be ready to satisfy a dis-satisfied customer. While it may seem that the buyer is unreasonable and unjust in his demands, yet for a breeder who expects to stay in business it will be advisable to do everything possible to satisfy the customer. A purebred swine breeder, to be successful, must be a good producer and build up a herd from foundation stock of good type and a good line of breeding. Such a herd should contain foundation stock that possess good strong bone, good conformation and a large digestive capacity. It is important to properly develop all young breeding stock that is to be sold.

It is better not to over-describe an animal in corresponding with prospective buyers. In answering inquiries the proper age and exact weight and pedigree of the animal should be given so that prospective buyers may make their selection. Prompt reply to all sales and neatness in shipment will make future sales and give the buyers a better impression of the breeders. All crates should be properly tagged, hogs well cleaned and in good condition when shipped, so as to put them in the hands of the purchaser in the best possible condition. It is often well to ask the buyer to give a statement of the condition and satisfaction of the hog upon arrival. Prompt registration and forwarding of certificates are points that make a responsible breeder.

Popularity of the Breed.—The first evening session was opened with a discussion of "Why Berkshires for the Farmer, Feeder and Packer" by Dean C. F. Curtis, of Ames, Iowa. He briefly reviewed the development of the pork industry in Iowa and indicated by figures why beef and pork are a combination that must go together. He stated that where live stock was kept on Iowa farms an increased yield of 14 bushels of corn per acre was secured. He feels that there is a bright outlook in swine industry since there is no tariff legislation or other uncertain business matters that have a tendency to discourage the production of pork. The greatest difficulty encountered is the question of disease. He called attention to breed tests in which the Berkshires had always held a prominent place, both in the economy of production and daily gains made, stating that Berkshires very often sold at the top of the market indicating that the packer was favorable to the Berkshire hog. He discussed the matter of pasture for hogs, stating that an average leguminous crop had given entire satisfaction and made it possible to produce hogs much cheaper besides reducing the danger of disease.

This discussion was followed by a demonstration with live barrows by W. H. Tomhave, of Pennsylvania State College. Two fat barrows were secured for this purpose, one being a desirable type of the right conformation and properly finished and the other a barrow of inferior type and not well finished for market. The desirable and undesirable points of each animal were discussed after which the hogs were taken in charge by a York packer where they were slaughtered and carcasses prepared for the meat demonstration the following evening.

Hog Cholera.—The meeting on the second day was opened with a discussion by J. L. Thatcher, of Iowa, on the subject of "The Breeders' Experience with Simultaneous Treatment for Hog Cholera." He stated that Iowa had more hogs in 1913 than all Atlantic sea board states and that the loss from hog cholera amounted to $16,000,000 in 1912. These conditions made it necessary to take some decided steps concerning the control of hog cholera and his experience at the Iowa farms was that the simultaneous treatment had reduced the amount of this disease to a minimum. He stated, however, that the use of simultaneous treatment was to be guarded by local conditions; that under many conditions he would not deem it advisable to use the simultaneous treatment. His experience proved to him that it was extremely important that both the serum and virus be fresh and potent. He felt that in practically every case, where undesirable results were obtained, it was due to poor serum.

The national and state governments should supervise every commercial manufacturing plant and all manufactured serum should be inspected before being sent from the factories. The breeder must know when and what hogs to treat in order to obtain satisfaction. The feeding hogs on his farm were taken off dry and heavy feed for several weeks during the vaccinating period. This subject led to a very interesting discussion concerning the control of hog cholera. It seemed to be the opinion of a great many that somethings could be done to stamp out cholera and that it could only be done by cooperation. Breeders took the stand that hog cholera could be controlled if the premises were properly cleaned and disinfected with strong solutions of lysol and lime and the means of dogs and birds carrying this infectious material be guarded against.

Mr. Thatcher was followed by Dr. R. M. Staley, of Pennsylvania, who discussed hog cholera in Pennsylvania. He presented a brief report concerning the amount of hog cholera in the state at the present time. He stated that formerly there was a loss of 90 percent from hog cholera where it had now been reduced to 22 percent by proper precaution in keeping outbreaks from spreading. He feels that many outbreaks of hog cholera are caused by the use of slops and garbage from cities. He states that where this was to be used it should be properly cooked so as to destroy all germs, and all other material should be properly burned and limed; this being done the control of hog cholera in this state would not be difficult. Pennsylvania is using only the simple serum method, feeling that in this way the cholera can be controlled if proper preventative measures are used.

Breeding as a Business.—W. E. Corsa, Illinois, stated that it is necessary to adopt good business principles in handling all purebred live stock. These results can only be obtained when one breed of each class of live stock is kept. Every beginner should make a careful study of the feeding and breeding of the class of animals that he selects. Animals of scrub breeding or with a scrub pedigree, should be avoided. It is very often a serious mistake to lay too much emphasis on fancy points and forget the utility value of the breeding animals. He stated that waiting, watching and working usually brings reward to the breeder. Constructive breeders are generally good feeders and he pointed out the advantage of constant employment on the live stock farm. Purebred sires clubs might be found to promote the purebred industry. His success in the purebred business has taught him that there are great opportunities, but there is no easy money to be made, altho it does bring a pleasure in associating with men that have high ideals and good business principles; it has not made millionaires. A herd of purebred live stock requires more efficient labor and consequently, costs more to develop than scrub or inferior stock.

Experiences.—N. H. Gentry, of Missouri, who is by many considered the father of the present Berkshire business, discussed the subject of "Experiences as a Breeder." He reviewed the development of his famous herd of Berkshires, together with his experience as a showman. In 1876 he purchased three animals that cost him $1,800, which was at that time considered one of the most sensational purchases ever made in the hog business. He felt that this purchase did as much as any one thing in securing buyers for his product. He felt that the beginner should purchase the best foundation stock that his means would permit, and that the opportunities in live stock business were as good today as when he began his work in the early seventies. His advice to breeders or advocates of purebred live stock is to get enthusiastic over the development of a high-class herd, as enthusiasm is the motor power in the chosen line of endeavor.

Business Integrity.—A. H. Tyron, of Ohio, discussed the subject of "Integrity of the Breeder." He took the stand that integrity should be the foundation of all live stock business; to give the buying public the full value of the purchase price and to make honest dealings the prime essential in developing of purebred live stock. The true value of all animals should be based on individual excellence, besides additional value in pedigree. The breeder should tell all buyers the poor points as well as the good points of the individuals that are for sale. A misrepresented animal usually means a dissatisfied customer, which no purebred breeder can afford to have on his list.

Berkshires on Every Farm.—L. E. Frost, of Illinois, spoke on "Why Berkshires on Every Farm." He stated that Berkshires were found in many sections of the east, south and west, altho not in as large numbers as they should be. He praised the excellence of Berkshire meat as compared to other classes of swine and urged that a special feature be made in promoting the breed. He suggested that in order to encourage the distribution of Berkshires and to make them popular, it would be necessary to have them exhibited in greater numbers at the various county fairs thruout the United States. He urged that an educational campaign be conducted to promote Berkshires in every section of the country.

Scientific Breeding.—An illustrated lecture was given by Prof. H. Hayward, of Delaware College, on "Scientific Breeding." He discussed the work that has been done in the past by live stock breeders and illustrated how it has been effective in building up the various breeds of live stock, together with the important part the various systems of breeding have taken in developing the various breeds.

The meat cutting demonstration, using the same barrows as were used in the live demonstration, was conducted by Prof. W. H. Tomhave. Both barrows were cut up in a commercial way, at the same time bringing out the desirable and undesirable points that were discussed in the animals on foot. The next session was devoted to a judging demonstration.

Berkshire Sale.—The purebred Berkshire sale was held on Wednesday afternoon. This sale was well represented by farmers and breeders from many sections of the United States. The hogs entered were excellent representatives of the Berkshire breed, which was indicated by the high average of $168 on the 49 head sold. Rockwood Barronness 17th, a yearling sow consigned by Rockwood Farms, Ames, Iowa, topped the sale at $650 going to Dellchester Farms, Newtown Square, Pennsylvania. One of the noticeable features of this sale was that every hog sold remained in the eastern part of the United States. None of the hogs went west of Pennsylvania.

Election of Officers.—At the annual business meeting the following officers of the American Berkshire Congress were elected for coming year: President, A. H. Tyron, Willoughby, Ohio; vice president, Henry Fielden, Newtown Square, Pa.; secretary and treasurer, F. S. Springer, Springfield, Ill. The place of holding the next meeting will be decided by the directors at some future session.

At the business meeting of the Pennsylvania Live Stock Breeder's Association it was decided to amalgamate the two societies, The Live Stock Breeders' Association and Pennsylvania Plant Breeders' Association, and that it be known as the Pennsylvania Breeders' Association. The following officers were elected for the ensuing year: President, E. S. Bayard, Pittsburgh, Pa; first vice president, M. D. Shoemaker, Greensburg, Pa.; second vice president, Carl W. Gay, Philadelphia, Pa.; secretary, George W. Stevenson, Waverly, Pa.; treasurer, J. F. Lance, Philadelphia, Pa. A Pennsylvania Berkshire Breeders' Association was also formed with officers as follows: President, H. Fielding, Newtown Square, Pa.; vice president, G. T. VanNorman, Philadelphia, Pa.; secretary-treasurer, J. E. Buckley, Philadelphia, Pa.—T.

EXERCISE FOR THE BROOD SOW

The sows that are to farrow in the spring should be taking exercise these days. Pigs will come stronger and will do better. The sow that has had plenty of exercise is not likely to eat her pigs, if never having done so. We recently found one of our bred sows half a mile from the sleeping quarters roaming a stubble field that had lately been cleared of fodder. We get rid of the short-legged, sluggish, fat sows. This sow is the leggy, muscular type that keeps on the move. Her two litters of nine pigs each, raised and sold without runts, are the best indorsement of her methods of exercise.—Geo. P. Williams, Delaware Co., O.

Cattle Lice.—There is not as much trouble with cattle lice as there used to be, because the animals are much better cared for. However, it is well to keep an eye out for any advances in this direction and take any necessary precautions. Curry the animals daily; and as a precaution, dust some one of the commercial powders on their backs occasionally and work it down into the hair. The animals will be thoroly appreciative of this treatment.—F. H. Dow.

SWINE.

THIS O.I.C. SOW WEIGHED 932 LBS. AT 23 MONTHS OLD

Studebaker WAGONS BUGGIES HARNESS

A Studebaker wagon bought in 1868 —and working today

AWAY back in 1868 Mitcheal Everman of Centerville, Ia. bought a Studebaker Farm Wagon for $110.00. The wagon has faithfully served *three generations* of farmers and C. H. Everman, grandson of the man who bought the wagon, writes "there is not a crack in the hubs." Perhaps you would like to read Mr. Everman's letter. It would be difficult to write a more convincing argument in favor of Studebaker Farm Wagons.

Here is the letter:
Studebaker, South Bend, Ind.—I have a Studebaker Regular Farm Wagon that was bought in Centerville, Ia. by my Grandfather, Mitcheal Everman, in the year 1868—and has been in constant use in the family ever since. The wagon cost my grandfather $110.00 and has the same wheels, axles, skeins and bolsters on it today as when it was bought and there is not a crack in the hubs. The wagon is in reasonably good repair and I have recently been hauling 1½-yard loads of sand in it.
C. H. EVERMAN, Mystic, Ia.

WHAT THIS PROVES
It proves that the wagon bought by Mr. Everman was made of the best material and workmanship—that's why it is still working—
It proves that it pays to buy the *best*. *Studebaker wagons are the best.*
Even if a Studebaker wagon costs a little more at the time of your purchase—if it will last a lifetime, it is the best wagon to buy.
Studebaker Wagons today are built of the very best material and because of the improved method of manufacturing they are even better than they were in 1868—and the price is less.
Just remember that Studebaker has been building wagons for over sixty years and during all that time their one effort has been to build not the cheapest, but the best—that is the reason they are the largest wagon builders in the world.
Studebaker buggies are also built to last a lifetime and have no equal in style and finish.

FELS-NAPTHA

Household

THE INVALID'S TRAY.

By Mrs. H. M. Woodward

I have for many years had a few things that are used only during sickness. Among them is a small china tray in the form of a leaf, having circles with raised rims wherein are set the cup, sugar bowl and creamer. When the invalid requires only a cup of hot drink and a slice of toast this is a great convenience, the raised edges keeping the dishes from sliding about, but it is entirely too small to serve a meal upon. At a Sanatarium where I spent four weeks not long ago I saw individual dishes for the use of invalids that showed me how easy it is for one to make the dainty tray and make even a patient with no appetite try to eat. Individual sets of dishes of various kinds and colors can be obtained or separate pieces to suit one's fancy, tea or coffee pots, holding one cupful match the most of the sets, all having broad bases, as do also the sugar bowls and creamers, so they are not easily upset.

PREPARING WAFFLED POTATOES.

There is such a variety in the dishes, not only in color but in form, and often six or seven meals would be served in succession without the same set being used more than once. A tiny platter is used for meat, fish or omelet; individual casseroles and ramekins for vegetables or other food that is to be kept hot. Even when the food is not cooked in them, they are heated before it is put in, and it keeps hot longer than in any other way. Side dishes are small, holding only enough to tempt the appetite and never enough to tire one of the food.

The china toast rack holds two small slices. With the set of Japanese blue and white ware were small round covered dishes to hold food to be kept hot, the covers made with a rim on top exactly like that on the bottom of the dish, and when removed the cover stands in such a position that the sweat from the hot food cannot drip onto the tray cloth. It can also be used as a dish when a shallow one is needed. Some of the sets have no saucers, but instead have a circle with raised rim at one side of the plate, which is very convenient when only a light meal is served.

All dishes used at one time should correspond at least in color, as the invalid is often much disturbed by clashes of color. An especially beautiful set of these dishes was a pale sea green color all over without figures or other decoration. It seems to me that in a hot day they would give a sense of coolness and freshness that nothing else could.

For serving a dainty dessert the clear and thin stemmed glasses are most attractive, and if one is careful to select a style with broad base there is little danger of its being tipped over.

When serving hot rolls or toasted crackers they look most dainty rolled in a doily and placed in a covered dish.

The individual salt and pepper sets can be had in two styles; there is a tiny silver stand with clear glass bottles, but the kind I preferred had separate bottles of china without the frame, very small and tapering from a base an inch wide to the perforated top of not more than a third that size. All I have seen were of creamy white ware dusted near the top with gold.

The trays should be of papier mache or bamboo, preferably one of each, of large size, so that dishes will not be crowded. The former are pure white with enamel finish, do not become marred and are washed as easily as a dish. The square ones are best if a whole meal is to be served.

Tiny trays on which the medicine can be served are also useful, some of them being very beautiful. All trays for invalids' use should be deeper than for other purposes, so there will be less danger of dishes being pushed over the edges.

There should be a variety of tray cloths also, not necessarily with any great amount of hand work on them, but variety in form and coloring. An assortment of the dainty paper doilies will be found useful and attractive without adding to the laundry work. They come in several sizes, 5 to 9 inches in diameter, one kind costing 10 cents per 75, with 15 of each size. More beautiful ones of paper with linen finish and more elaborate lace border cost 10 cents for 24 assorted ones. A small one under the water glass or under any glass dish makes the tray very attractive, and they can also be used on the plate on which sandwiches, crackers or cake are served.

A fresh napkin, preferably paper, should be furnished at every meal. So many beautiful ones can now be obtained in crepe paper that an assortment can be had that will make more variety and less work than when linen ones are used.

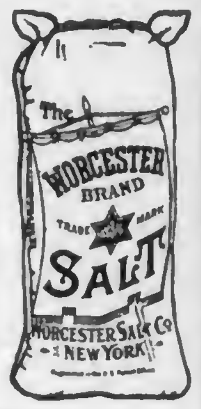
A table that is very convenient, and almost necessary if sickness is prolonged, is called a bedside table. It is made in such a way that the top extends over the patient's lap when he, or she, is proped up in bed being adjusted to any height or angle. The base extends under the bed so the balance is maintained and it can not tip. There are two sizes of these table tops, 18x24 and 18x27 inches, being made of oak or bird's eye maple veneer, and costing $3.25 to $4.75. In many cases families own one jointly, taking it from one home to another as needed. I have also seen a home-made table that answers the purpose. It is made like a footstool, except that the top is large like the bedside table top. The legs at the corners are long enough so that the table will not rest on the lap of the patient but will be low enough to be handy for use.

A sprig of parsley served with any meat, vegetable or soup looks very attractive. Any food that can be served on a lettuce leaf and a candied cherry, slice of orange or of lemon makes a wonderful difference in the appearance of any dessert.

In preparing jellied meats or fruits, blanc mange or gelatin it is well to use individual molds so that when the food is turned out it is in attractive form. One can find a great variety of aluminum molds in the ten-cent stores.

If whipped cream is liked a great many nice desserts can be prepared which are not only attractive to the eye but nourishing as well. When cool drinks are served they can be made more agreeable, tho possibly no cooler, by the addition of enough bits of ice to tinkle against the glass. Malted milk is often ordered and many patients dislike it, but it can usually be made palatable in one of two ways. Some people prefer it hot with salt, pepper and a little butter which makes it seem like soup; others like it cold with a little chocolate syrup and whipped cream, and take it thru a straw. In sickness one should always have some straws as it is often better to have the patient take a cold drink very slowly.

No medicine should be in evidence except at the moment when it is given to the patient. Small fancy wine glasses and beakers are nice to use when giving it, some beautiful ones being on the market at a low price. —Winnebago Co., Ill.



Change bitter butter to *better* butter

Whether you make your own butter or have it made at the creamery, you know that bitter-tasting salt is bound to affect the flavor of the butter. And the price you get for the butter depends mainly on its flavor.

It's easy to prove whether the salt you are using is bitter or not. Test it thus: Make a little brine. If the brine tastes bitter—change to Worcester Salt.

Worcester Salt leaves no bitter taste.

It is always sweet and savory. More—its pure, uniform crystals work into the butter evenly, making "mottling" impossible to occur.

For better butter-flavor and better butter-prices, see that the salt used is always

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

SYNOPSIS OF PREVIOUS CHAPTERS.

Farmer Winston, having failed as a homesteader, desperate, accepts a proposal to simulate Lance Courthorne, an adventurer. Courthorne and his pals are thus able to carry thru some smuggling operations. In the clash with the police, Courthorne kills Trooper Shannon, leaving evidence pointing to Winston as the murderer. The scene shifts to Silverdale, founded by Colonel Barrington. The Colonel is worried over wheat operations and the coming advent of Lance Courthorne, cousin to Maud Barrington, niece and ward of Colonel Barrington, to claim his share of his father's estate. Maud Barrington is told of Courthorne's past misdeeds. Winston, meanwhile, has pushed on to Montana, being held and later released, for lack of evidence, by a government officer, who discloses the belief on the part of the police that Winston is the murderer of Trooper Shannon. A letter for Courthorne is opened by Winston. Complying with instructions therein, he meets and confers with a lawyer respecting Courthorne's inherited acres at Silverdale, and following out his role as simulator of Courthorne, goes to Silverdale and is there received as graciously as could be expected. Some of his actions fail to tally with Courthorne's reputation. He wins the good will of Dane, one of the Colonel's advisers. The real Courthorne, who was supposed to have been drowned during the smuggling adventure, now reappears in Montana, inadvertently learns of his inheritance, and pieces together conclusive evidence that Winston has gone to Silverdale. Courthorne and Ailly Blake, whose life he has blighted, agree to ignore each other's identity. Winston and Maud Barrington, caught by a blizzard while driving to Silverdale, find shelter in a deserted shed over night, where he acts the part of a considerate gentleman. Maud Barrington promises Winston to sow her land in wheat the following spring. Under criticism from the Colonel Winston begins planting operations. He is commended by Maud Barrington for successful efforts to break the gambling habits of Ferris, a young Englishman, a task undertaken at her request. Courthorne now appears and Winston contracts to advance him money, provided he absents himself immediately. During a fire which threatens the wheat fields Winston is injured. Suspicions point to Ferris as the incendiary. Questioned, he admits his guilt, and is dispatched from the settlement. Winston sells his wheat and that of his friends at big profits. They pledge him support. Colonel Barrington, disregarding advice, loses heavily. Maud Barrington meets Winston one night near a bridge he is building on the range, where they are seen by Courthorne, who seeks by threats to extort more money from Winston. The latter prevents Courthorne's death on the bridge. Courthorne, hailed by a trooper, who takes him for Winston, signs documents intended for Winston and forgets to hand them to him later. At the hotel he is compelled to make a quick departure because of familiarities with a waitress, whose protector later tries to his sorrow to exact satisfaction from Winston, taking him as the offender, not, however, before part of the encounter is seen by the Colonel. Maud Barrington still asserts to her aunt that Winston is irreproachable.

CHAPTER XXI

The Face At The Window

It was a hot morning when Sergeant Stimson and Corporal Payne rode towards the railroad across the prairie. The grassy levels rolled away before them, white and parched, into the blue distance, where willow grove and straggling bluff floated on the dazzling horizon, and the fibrous dust rose in little puffs beneath the horses' feet, until Stimson pulled his beast up in the shadow of the birches by the bridge, and looked back towards Silverdale. There, wooden homesteads girt about with barns and granaries rose from the whitened waste, and behind some of them stretched great belts of wheat. Then the Sergeant, understanding the faith of the men who had sown that splendid grain, nodded, for he was old and wise, and had seen many adverse seasons, and the slackness that comes, when hope has gone, to beaten men.

''They will reap this year—a handful of cents on every bushel,'' he said. ''A fine gentleman is Colonel Barrington, but some of them will be thankful there's a better head than the one he has, at Silverdale.''

''Yes, sir,'' said Corporal Payne, who wore the double chevrons for the first time, and surmised that his companion's observations were not without their purpose.

Stimson glanced at the bridge. ''Good work,'' he said. ''It will save them dollars on every load they haul in. A gambler built it! Do they teach men to use the ax in Montana saloons?''

The corporal smiled, and waited for what he felt would come. He was no longer the hot-blooded lad who had come out from the old country, for he had felt the bonds of discipline, and been taught restraint and silence on the lonely prairie.

''I have,'' he said tentatively, ''fancied there was something a little unusual about the thing.''

Stimson nodded, but his next observation was apparently quite unconnected with the topic. ''You were a raw colt when I got you Payne, and the bit galled you now and then, but you had good hands on the bridle, and somebody who knew his business had taught you to sit a horse in the old country. Still, you were not as handy with brush and fork at stable duty.''

The bronze seemed to deepen in the corporal's face, but it was turned steadily towards his officer. ''Sir,'' he said, ''has that anything to do with what you were speaking of?''

Stimson laughed softly. ''That depends, my lad. Now, I've taught you to ride straight, and to hold your tongue. I've asked you no questions, but I've eyes in my head, and it's not without a purpose you've been made corporal. You're the kind they give commissions to, now and then—and your folks in the old country never raised you for a police trooper.''

''Can you tell me how to win one?'' asked the corporal, and Stimson noticed the little gleam in his eyes.

''There's one road to advancement, and you know where to find the trooper's duty laid down plain,'' he said, with a dry smile. ''Now, you saw Lance Courthorne once or twice back in Alberta?''

''Yes, sir, but never close to.''

''And you knew farmer Winston?''

Payne appeared thoughtful. ''Of course I met him a few times on the prairie, always on horseback with his big hat on, but Winston is dead—that is, I heard him break thru the ice.''

The men's eyes met for a moment, and Stimson smiled curiously. ''There is,'' he said, ''still a warrant out for him. Now, you know where I am going, and while I am away, you will watch Courthorne and his homestead. If anything curious happens there, you will let me know. The new man has instruction to find you any duty that will suit you.''

The corporal looked at his officer steadily, and again there was comprehension in his eyes. Then he nodded. ''Yes, sir. I have wondered whether, if Shannon could have spoken another word that night, it would have been Winston the warrant was issued for.''

Stimson raised a restraining hand. ''My lad,'' he said dryly, ''the police trooper who gets advancement is the one that carries out his orders and never questions them, until he can show they are wrong. Then he uses a good deal of discretion. Now you know your duty?''

''Yes, sir,'' said Payne, and Stimson, shaking his bridle, cantered off across the prairie.

Then, seeing no need to waste time, the corporal rode towards Courthorne's homestead, and found its owner stripping a binder. Pieces of the machine lay all around him, and from the fashion in which he handled them it was evident that he was capable of doing what the other men at Silverdale left to the mechanic at the settlement. Payne wondered, as he watched him, who had taught the gambler to use spanner and file.

''I will not trouble you if you re busy, Mr. Courthorne, but if you would give me the returns the Bureau ask for, it would save me riding round again,'' he said.

''I'm afraid I can't,'' said Winston. ''You see, I haven't had the papers.''

''Trooper Bacon told me he had given them to you.''

''I don't seen to remember it,'' said Winston.

Payne laughed. ''One forgets things when he is busy. Still, you had them—because you signed for them.''

Winston looked up suddenly, and in another moment smiled, but he was a trifle too late, for Payne had seen his astonishment, and that he was now on guard.

''Well,'' he said, ''I haven't got them now. Send me a duplicate. You have, no doubt, some extra forms at the outpost.''

Payne decided that the man had never had the documents, but was too clever to ask any questions or offer explanations that might involve him. It was evident he knew that somebody had impersonated him, and the fact sent a little thrill thru the corporal; he was at least on the trail.

Mitchell Big Six
$2,350.00

An uneven road plays hob with an automobile that isn't properly constructed and *which lacks engineering balance.* It strains the frame, the axles, the springs and the motor of a cheaply built car and no amount of repairs can *ever* make it good.

The Mitchell car is built to *give* where the give is necessary—to resist the strain and sudden jolt - to surmount these and other difficulties *without the disastrous wear and tear* which makes other cars burdens after a year's use—*or less.*

Farmers need better cars than people who live on smooth boulevards and there are hundreds of modern farmers who will tell you that the Mitchell has lasted them—in constant use—*five, six, seven and eight years* and are still the splendid utilities today that they were when bought.

The Mitchell car is more car and better car for the money than any other car in existence and we commend it to the farmer who wants an *economical utility* rather than an *expensive luxury.*

The Mitchell Models for 1914:

''I'll bring you one round the next time I'm in the neighborhood,'' he said, and Winston sat still with the spanner lying idle in his hand when he rode away.

He realized that Courthorne had taken the papers, and his face grew anxious as well as grim. The harvest was almost ready now, and a little while would see it in. Then his work would be over, but he had of late felt a growing fear lest something, that would prevent its accomplishment, might happen in the meanwhile. Then almost fiercely he resumed the stripping of the machine.

An hour or two later Dane rode up, and sat still in his saddle looking down on Winston with a curious smile on his face.

''I was down at the settlement, and found a curious story going round,'' he said. ''Of course, it had its humorous aspect, but I don't know that the thing was quite discreet. You see, Barrington has once or twice had to put a stern check on the indulgence in playfulness of that kind by some of the younger men, and you are becoming an influence at Silverdale.''

''You naturally believed what you heard. It was in keeping with what you have seen of me?''

Dane's eyes twinkled. ''I didn't want to, and I must admit that it isn't. Still, a good many of you quiet men are addicted to occasionally astonishing your friends, and I can't help a fancy that you could do that kind of thing as well as most folks, if it pleased you. In fact, there was an artistic finish to the climax that suggested your usual thoroughness.''

''It did?'' said Winston grimly, remembering his recent visitor and one or two of Courthorne's Albertan escapades. ''Still, as I'm afraid I haven't the dramatic instinct, do you mind telling me how?''

Dane laughed. ''Well, it is probable there are other men who would have kissed the girl, but I don't know that it would have occurred to them to smash a decanter on the irate lover's head.''

Winston felt his fingers tingle for a grip on Courthorne's throat. ''And that's what I've been doing lately? You, of course, concluded that after conducting myself in an exemplary fashion an astonishing time it was a trifling lapse?''

''Well,'' said Dane dryly, ''as I admitted, it appeared somewhat out of your usual line, but when I heard that a man from the settlement had been ejected with violence from your homestead, what could one believe?''

''Colonel Barrington told you that!''

''No,'' said Dane, ''you know he didn't. Still, he had a hired man riding a horse he'd bought, and I believe—tho it is not my affair—Maud Barrington was there. Now, of course, one feels diffident about anything that may appear like preaching, but you see, a good many of us are following you, and I wouldn't like you to have many little lapses of that kind while I'm backing you. You and I have done with these frivolities some time ago, but there are lads here they might appeal to. I should be pleased if you could deny the story.''

Winston's face was grim. ''I'm afraid it would not suit me to do as much just now,'' he said. ''Still, between you and I, do you believe it likely that I would fly at that kind of game?''

Dane laughed softly. ''Well,'' he said, ''tastes differ, and the girl is pretty, while you know, after all, they're very much the same. We have, however, got to look at the thing sensibly, and you admit you can't deny it.''

''I told you it wouldn't suit me.''

''Then there is a difference?''

Winston nodded. ''You must make the best of that, but the others may believe exactly what they please. It will be a favor to me if you remember it.''

Dane smiled curiously. ''Then I think it is enough for me, and you will overlook my presumption, Courthorne. I wonder now and then when I shall altogether understand you!''

''The time will come,'' said Winston dryly, to hide what he felt, for his comrade's simple avowal had been wonderfully eloquent. Then Dane touched his horse with his heel and rode away.

It was two or three weeks later when Winston, being requested to do so, drove over to attend one of the assemblies at Silverdale Grange. It was dark when he reached the house, for the nights were drawing in, but because of the temperature few of the great oil lamps were lighted, and the windows were open wide. Somebody had just finished singing when he walked into the big general room, and he would have preferred another moment to make his entrance, but disdained to wait. He, however, felt a momentary warmth in his face when Miss Barrington, stately as when he had first seen her in her rustling silk and ancient laces, came forward to greet him with her usual graciousness. He knew that every eye was upon them, and guessed why she had done so much.

What she said was of no moment, but the fact that she had received him without sign of coldness was eloquent, and the man bent very respectfully over the little white hand. Then he stood straight and square for a moment and met her eyes.

''Madam,'' he said, ''I shall know whom to come to when I want a friend.''

Afterwards he drifted towards a group of married farmers and their wives, who except for that open warranty, might have been less cordial to him, and presently, tho he was never quite sure how it came about, found himself standing beside Maud Barrington. She smiled at him, and then glanced towards one of the open windows, outside which one or two of the older men were sitting.

''The room is very hot,'' said Winston tentatively.

''Yes,'' said the girl. ''I fancy it would be cooler in the hall.''

They passed out together into the shadowy hall, but a little gleam of light from the doorway behind them rested on Maud Barrington as she sat down. She looked inquiringly at the man as tho in wait for something.

''It is distinctively cooler here,'' he said.

Maud Barrington laughed impatiently. ''It is,'' she said.

''Well,'' said Winston, with a little smile, ''I will try again. Wheat has made another advance lately.''

The girl turned towards him with a little sparkle in her eyes. Winston saw it, and the faint shimmer of the pearls upon the whiteness of her neck, and then moved his head so that he looked out upon the dusky prairie.

''Pshaw!'' she said. ''You know why you were brought here tonight.''

Winston admired her courage, but did not turn around, for there were times when he feared his will might fail him. ''I fancy I know why your aunt was so gracious to me. Do you know that her confidence almost hurts me?''

''Then why don't you vindicate it and yourself? Dane would be your mouthpiece, and two or three words would be sufficient.''

Winston made no answer for a space. Somebody was singing in the room behind them, and thru the open window he could see the stars in the soft indigo above the great sweep of prairie. He noticed them vacantly and took a curious impersonal interest in the two dim figures standing close together outside the window. One was a young English lad, and the other a girl in a long white dress. What they were doing was no concern of his, but any trifle that diverted his attention a moment was welcome in that time of strain, for he had felt of late that exposure was close at hand, and was fiercely anxious to finish his work before it came. Maud Barrington's finances must be made secure before he left Silverdale and he must remain at any cost until the wheat was sold.

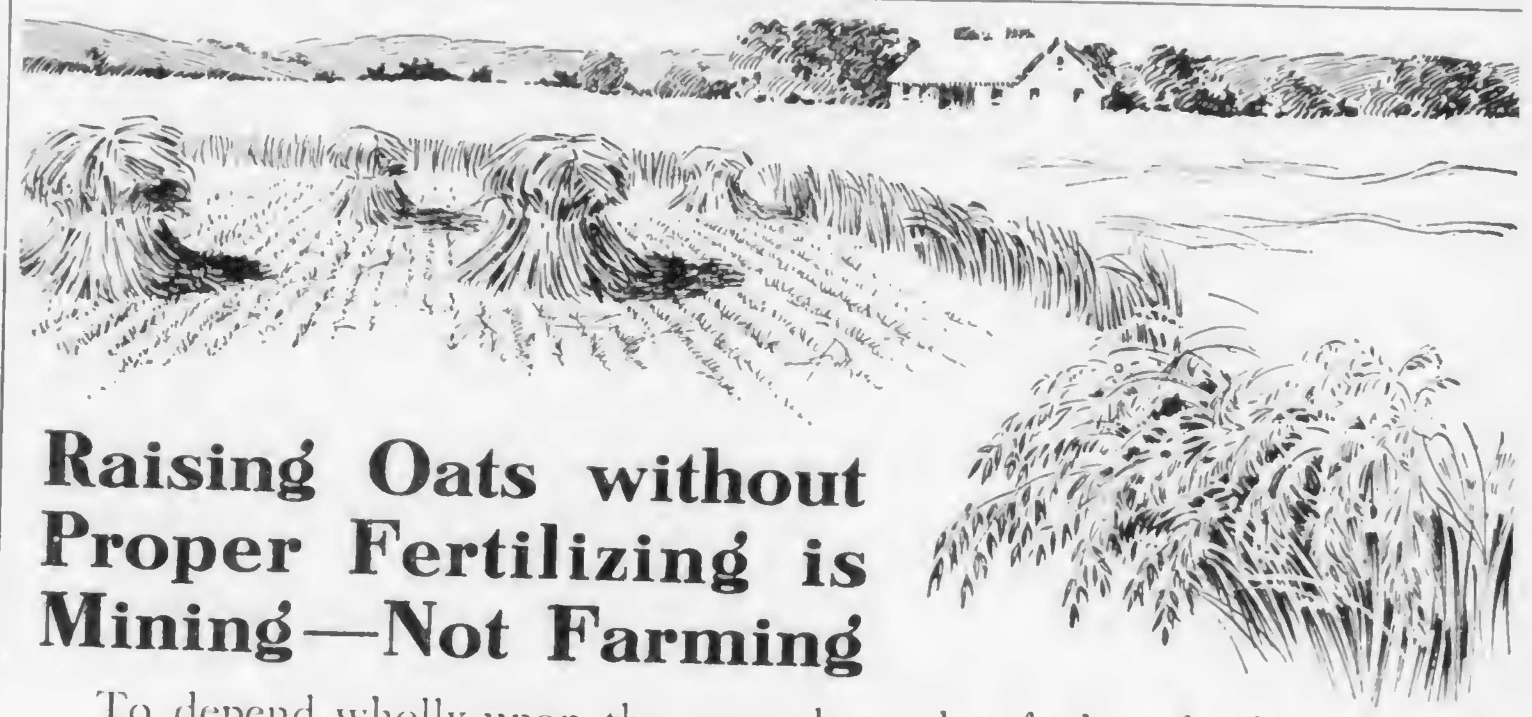
Then he turned slowly towards her. ''It is not your aunt's confidence that hurts me the most.''

The girl looked at him steadily, the color a trifle plainer in her face, which she would not turn from the light, and growing wonder in her eyes.

''Lance,'' she said, ''we both know it is not misplaced. Still, your impassiveness does not please us.''

Winston groaned inwardly and the swollen veins showed on his forehead. His companion hal leaned forward a little so that she could see him, and one white shoulder almost touched his own. The perfume of her hair was in his nostrils, and when he remembered how cold she had once been to him, a longing that was stronger than the humiliation that came with it grew almost overwhelming. Still, because of her very trust in him, there was a wrong he could not do, and it dawned on him that a means of placing himself beyond further temptation was opening to him. Maud Barrington, he knew, would have scant sympathy with an intrigue of the kind Courthorne's recent adventure pointed to.

(To be continued.)



Raising Oats without Proper Fertilizing is Mining—Not Farming

To depend wholly upon the natural supply of plant food in the soil is neither most profitable nor most economical.

Oats take from your land more potash than phosphoric acid or nitrogen. You must supplement the supply of available soil

POTASH

by a fertilizer rich in this element, or your harvest may not pay you for your labor.

Potash Pays in heavier heads, better grade, a greater proportion of grain to straw, and freedom from lodging. Balance the phosphate and nitrogen with 6 to 8% of potash.

Poor crops of oats are often due to rust. Potash gives the plants vigor to resist the rust fungus. Available potash is needed as soon as the oats germinate.

Drill in with the seed 300 to 400 pounds per acre of a 3-8-6 or 3-8-8 goods and provide the available plant food for the young plants before the soil supply becomes soluble.

This is an insurance against no crop in bad years.

The old 1-7-1 and 2-8-2 formulas are not up-to-date. They belong to the preliminary, not to the permanent, stage of profitable fertilizing.

We sell **Potash** in any quantity, from one 200-pound bag up.

Wholesale Grain Market. — Wheat, 94c; corn, 70c; oats, 47c; rye, 67c.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., Feb. 2, 1914.

Beef Cattle.—Trade was of a draggy and indifferent character and while prices were holding about steady under moderate offerings general conditions were unsatisfactory. Ohio, Virginia and Pennsylvania brands were principally in evidence.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,566	7,905	5,687
Previous week	2,770	7,711	4,919

Best steers	$8.65@8.80
Choice steers	8.50@8.60
Good	8.30@8.40
Medium steers	7.87@8.10
Common steers	7.50@7.65
Bulls	5.25@6.70
Fat Cows	6.20@6.75
Medium cows	4.75@5.75
Thin cows	2.75@4.00
Milk cows	45.00@75.00

Veal calves steady.

Best calves	$11.50@12.00
Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do.	6.50@7.00
Roughs	5.00@8.00

Sheep and Lambs.—The light run of stock held values ordinarily steady, but the close was dull and disappointing.

Extra wethers	6.00@6.25
Choice wethers	5.75@6.00
Good do.	5.00@5.25
Common to medium	3.00@4.25
Ewes, fat	5.00@5.50
Extra lambs	8.25@8.50
Good to choice do	8.00@8.25
Common to medium	5.50@8.00

Hogs.—Inquiry was moderate, with a regular straight price predominating. Westerns $12.00.

City Dressed Stock. — Every variety of choice and prime meats closed steady, trade being normal. Steers, 11@13½c; heifers, 10½@13c; cows, 8@11c. Veal calves, 14@15c; country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@10c; extra wethers, 10½c. Spring lambs, 13@14c. Extras, 16c. Hogs, 12¼c.

BALTIMORE LIVE STOCK

Baltimore, Md., Feb. 2, 1914.

Cattle receipts for the week, 1,148 head against 2,169 last week.

Steers	$6.00@8.25
Heifers	5.50@7.25
Cows	3.00@6.25
Bulls	5.25@7.00
Fresh Cows	35.00@77.50

Sheep and lamb receipts for the week were 2,381 head against 2,116 last week. Fair supply; market slow.

Sheep	$3.00@6.00
Lambs	5.50@8.50

Calf receipts for the week were 426 head, Fair supply; market slow at $6.00@11.

Hog receipts for the week were 13,698 head against 14,411 last week.

Light Western	$9.25@9.35
Heavy to medium	9.10@9.15
Near-by	9.15@9.30
Pigs	9.00@9.15
Roughs	7.75@8.60

ELGIN BUTTER QUOTATION

Elgin, Ill., Feb. 2, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter strong at 26½c.

NEW YORK HAY MARKET.

New York City, Jan. 31, 1914.

Hay prices remain generally steady on all grades. There is a fair demand for the better grades. Receipts today were 1,188 tons. Timothy, No. 1, $1.05 bale; standard 97½c cwt, No. 2, 90@95c; No. 3, 80@85c; clover 80@97½c.

Straw.—Straws remains generally quiet. Receipts nominal. Oats straw 50@75c bale; rye 80@85c.

VISIBLE GRAIN SUPPLY

New York, Feb. 2.—Visible supply of grain:

Wheat, decreased, 847,000 bushels.

Wheat, in bond, decreased, 1,104,000 bushels.

Corn increased, 813,000 bushels.

Oats decreased, 429,000 bushels.

Oats, in bond, increased, 42,000 bushels

Rye decreased, 124,000 bushels.

Barley decreased, 451,000 bushels.

Barley, in bond, increased, 45,000 bushels.

Make Every Inch of Soil Produce the Maximum at Lowest Cost

IN ORDER to make your soil produce its maximum yield, you should supply a fertilizer "made to order" to meet your individual soil and crop conditions.

Consumers Brands for General Farm Use

comprise special distinct compositions of plant food elements for forage crops, root crops and cereals to meet just your individual soil and crop requirements. They supply just the constituents your particular soil may need for some special crop. You pay for no unnecessary plant food elements.

Early Crop Odorless Fertilizer

is prepared especially for the market garden trade for vegetables, small fruits, greenhouse and garden crops. It supplies the four plant food elements needed for these crops in soluble form, mixed in such proportions as to meet your particular soil and crop requirements. Although soluble, it is so prepared in granular form as to prevent leaching and wasting. It produces quick growth and early maturity, which means *bigger profits.*

Holden's Special Fertilizers

For Florists and Gardeners for Greenhouse Work

These fertilizers are prepared by men who have made a life study of greenhouse fertilization in such a manner as to furnish just the plant food elements which your compost lacks. For this reason you save the cost of such plant food elements as your particular soil or crop may not require.

Mak-Gro Odorless Plant Food

A clean, high grade, granular fertilizer for potted house plants, window boxes, flower beds, small fruits, lawns and general home garden use—**made for the amateur.** A splendid side line for florists operating their own stores.

Agricultural Chemical and Fertilizer Materials

We are prepared to furnish all high grade agricultural chemicals and fertilizer materials in any quantity. **We make a specialty of Genuine Thomas Phosphate Powder (Basic Slag).**

WE SELL ONLY DIRECT TO THE CONSUMER
Write today for our Fertilizer Booklet

CONSUMERS FERTILIZER COMPANY
303 Longacre Building New York City

Use the *Available* Kind of Fertilizer

For many crops all the *available* plant food that is needed is one grain to each pound of soil.

When such a small quantity of food must do all the work for your crop, it is exceedingly important that what you put into the soil in the form of fertilizer shall be *available*—that it shall have not only the right quantity, but the right quality and right crop value.

It has cost us forty years of experience to know how to mix the right kinds and the right quantities of ingredients for fertilizer.

Bowker's Fertilizers

accomplish also the more difficult task of getting the right blending, the right solubility into a mixture which will run readily and freely from the farmer's planter, and which will remain dry and drillable as well as efficient until used in the field. We make a brand to fit every crop need.

Write and tell us what your crops are, and we will send you our illustrated catalogue.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. When reply by mail is requested, it becames private practice and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Callus on Pastern.— We have a mule that was cut with wire on front pastern. It left a hard gristle or callus which causes lameness whenever she exerts very hard. She met with this injury five years ago. W. L. S., New Bloomfield, Pa.—An old chronic ailment of this kind is difficult to cure; however, if you will apply equal parts tincture iodine and camphorated oil, it will stimulate a healthy action and give some relief. These applications should be made every day or two.

Knuckling.—I have a horse coming four years old that knuckles in hind pastern joint. Will you prescribe for him? When starting he appears to rock forward as tho from weakness. I also have a three-year-old colt that does the same thing. S. M., Glenmore, Pa.—Natural conformation has a whole lot to do with a horse remaining sound, or becoming unsound. This family of horses is perhaps inclined to stand perpendicular on their joints with insufficient angle; therefore if the ligaments of fetlock become sprained, they soon tilt forward and when first starting are inclined to rock. Mix together 1 part aqua ammonia, and 3 parts sweet oil and apply to fetlock joint every day or two.

Indigestion—Impaction.—Recently I purchased a fresh cow with a good husky calf; she had been poorly kept, was very thin, and in fact she was merely a frame. Before buying I milked her and found her milk very rich, so believing I could get her up in shape and on account of good cows being scarce in this neighborhood, I took her. Since owning her, I fail to get her to eat any ground feed at all. I have tried bran slop and corn ground on the ear, but she will not touch them. She will eat whole corn off the ear and stalks with quite a relish. Her bowels are very constipated and thinking this might be the trouble, I gave her one pint of raw linseed oil, but this had no effect. Can you recommend a liquid physic or tell me what you think might be her trouble? She is only four years old and I would like to build her up. A. M., Freehold, N. J.—If her bowels do not act properly, give her one pound of Epsom salts in three pints of warm water as a drench daily until her bowels loosen. One dose is usually sufficient and cathartics should never be given unless the bowels refuse to act properly and when the stomach and bowels are over-loaded. In order to create an appetite you had better give her ½ oz. ground gentian, 1 dram ground nux vomica, 1 dram powdered sulphate of iron and a dessert spoonful of Fowler's solution in one pint of water as a drench, 3 times a day. If she will not eat this in feed, you may use 1 dram fluid extract nux vomica, ½ oz. fluid extract cinchona, ½ oz. fluid extract gentian at a dose in a pint of waater as a drench.

Fistula of Withers.—I have a 10-year-old mare that has a bunch on withers. I opened this bunch and allowed pus to escape and this discharge has kept up ever since. She seems in good health in other respects and I am quite anxious to get this bunch healed up. I have been advised to give serum treatment, but I would like to have your opinion before allowing my veterinarian to apply the treatment. M. S. T. Washington, Pa.—I have considerable confidence in polyvalent bacterin treatment, for I have obtained fairly good results by its use. I would advise you to let your veterinary treat the case. You may also advise him to apply 1 part iodoform and 10 parts boracic acid. This medicine should be put in a gelatine capsule and forced to bottom of abscess and allowed to remain there.

COUNTY NOTES

Cumberland Co., N. J. (C.) Jan. 15.—Farmers in this section are taking advantage of the warm weather and are plowing their sod fields and many are carting wood supply home. Some seed potatoes are being carted from the stations which have been shipped from Maine. The corn crop was rather light altho crops in general have been quite successful. Many farmers are working on the roads with their teams, the work being rushed before the ground freezes. Corn selling for 70c per bu.; eggs, 38c doz; butter 30 to 40c lb; wheat, 90c; oats, 60c; dressed chickens 23c lb; turkeys, 30c lb; wheat making a good growth.—C. J. S.

Montgomery Co., N. Y., (E.C.) Jan. 17.—Severe cold wave, 30 degrees below on January 13. Good sleighing. Stock and poultry suffer from cold. A county breeder recently sold a Holstein bull for $6,000 and some cows at fancy prices. Very little farm work being done. Fine ice being harvested. Stone Arabia Grange Installation very largely attended. Town taxes being collected.—John L. England.

Fayette Co., Pa., (S.W.) Jan. 20.—Has been very cold for the past week but it is warmer and raining today. There has been very little snow this winter. Live stock is still very scarce. Prices are continuing very high. Fat hogs are about all sold. Very few fat steers in this section. Feeders are selling at 7c per lb. The mild open winter has given the farmers a splendid opportunity to do their winter work. Wheat is looking fine. Some plowing has been done.—Samuel A. Harris.

Montour Co., Pa., (C.) Jan. 21.—Coldest weather was 12 degrees below. Storms change from rain to snow. Farm prices unchanged. Hogs, dressed, 11c; beef 6½@7½c; veal 9c; cows, $50 to $60; horses, $150 to $200; Apples, $1; potatoes, 90c to $1; corn, 75c; wheat, 90c; oats, 50c; hay, $16; butter, 40c; eggs, 35c; milk, 7c. The generally fine weather has enabled all to have work well in hand. Ice hauling about finished.—Benjamin L. Diehl.

JOHN DEERE TWO WAY PLOW

The Sulky with the Steel Frame and Patent Auto Foot Frame Shift

The John Deere Two-Way Plow will work equally well on hillsides and level land. It is well balanced, easy to operate, light draft and efficient,—built in the East for Eastern conditions.

It is the only two-way plow that has the Patent Auto Foot Frame Shift, which insures accurate and uniform width of cut. It will do the highest grade work for the longest time with the least possible effort and expense.

These Are Some of the Reasons:

1. All Steel and Malleable Frame—Steel Arch: Light, Strong and Durable—Rigid Connections—Permanent Alignments.
2. Patent Auto Foot Frame Shift: Slight foot pressure swings frame and accurately locates plow bottom.
3. Long Malleable Beam Clamps: No collars or set screws. Beam bolted rigidly to bracket, which extends to each bail arm. Cut always uniform.
4. Automatic Shifting Hitch: Positive and Automatic. Clevis cannot fail to move to position.
5. Automatic Horse Lift: Operator's foot releases latch. Pull of team raises bottom. Hand lever also provided.
6. Adjustable Jointers: Jointers clamped to beam. May be set forward or back or tipped at varying angles.
7. Wide Tread: Prevents tipping on hillsides and permits use of wide or narrow bottoms.
8. Chilled, Full Steel and Combination Bottoms: All styles made expressly for Eastern conditions.
9. Removable Shin Piece: Insures keen cutting edge—easily renewed—prolongs life of moldboard.

Write for John Deere Two-Way Book, handsomely illustrated in colors—and secure full information—free.

CHICAGO HOUSE WRECKING CO.

Now operated under the name of

HARRIS BROTHERS COMPANY

FOR 22 years the CHICAGO HOUSE WRECKING COMPANY has been well and favorably known to the public. During all these years the four Harris Brothers have been the executive officers and owners and for that reason have finally decided to operate under the name of HARRIS BROTHERS COMPANY.

There is no change in our business, except that in the future the four Harris Brothers will advertise and sell their goods, heretofore advertised and sold under the name of the CHICAGO HOUSE-WRECKING COMPANY, under the new name of HARRIS BROTHERS COMPANY.

Why We Are Called the Great Price Wreckers

Consider what becomes of the stock of goods, when a manufacturer or big retail merchant goes bankrupt or "busted" as the saying goes. It is estimated that about ten thousand merchants annually meet with business disaster—this is why our company exists. If the stocks are sufficiently large and the goods are new and desirable, they find their natural way to our great forty acre plant for distribution at a small added profit, to our thousands of customers, who in this way get the benefit of wonderful bargains. In many cases our prices do not even represent the original cost of production. We stand foremost in our line. We recognize no competition. That's why we are called "THE GREAT PRICE WRECKERS."

Our Binding Guarantee

We guarantee absolute and complete satisfaction. There is no half way about this guarantee. Every purchase you make from us will be exactly as represented and you will be satisfied in every way, or we will make such just amends as are within our power. We will take back any unsatisfactory article at our freight expense both ways and refund your purchase price. We refer as to our responsibility to the publisher of this or any other publication or any bank or express company and to the public at large.

We Sell Practically Everything

Our stock includes practically "everything under the sun." It's in truth, from a needle to a locomotive. No matter what your vocation, or what position in life you occupy, or what your business, or how great a merchant you are, you have use for us, and we have the goods that you can buy from us to a decided advantage. The quicker you learn to recognize this fact, the sooner you will be "putting money in your pocket."

Our stock includes Building Material, Lumber, Roofing, Sash, Doors, Millwork, Wire and Fencing, Hardware, Plumbing Material, Heating Apparatus and Supplies, Furniture, Household Goods, Rugs, Stoves and everything needed to furnish or equip your home, your club or hotel. It includes Groceries, Clothing, Dry Goods, Boots and Shoes, Furnishing Goods and every single article to clothe a man, woman or child. It includes Sporting Goods, Fishing Tackle, Hunting Outfits, Tents, Guns, Harness and Vehicles, Jewelry, Sewing Machines, Clocks; also structural iron needed in construction of buildings, bridges, etc. Machinery, gasoline, gas and electric power outfits. In fact you cannot think of a single manufactured article that we cannot supply you at a saving in price. Let us convince you—it means but little effort on your part to prove the truth of all we say. Write us today for our Catalogue and literature. Fill in the coupon shown below.

THE GREAT PRICE WRECKERS

A THOUSAND PAGES OF BARGAINS

LETTERS FROM CUSTOMERS

$1,000.00 Saved

Everything arrived in good condition. I saved on the building; also heating plant and bathroom outfit about $1000.00 as this kind of lumber would be very dear here.

Signed (LEWIS YOUNG, Pennsylvania.

$700.00 Saved

I am perfectly satisfied. Don't be backward in referring to me, for you have done more than you agreed to. I saved $700.00 and also got better material, and a better house.

(Signed) JOHN J. DUNN, Ohio.

Satisfied With Furnace

The furnace I got from you is perfect in every way. I would not be without it one winter for double its price. If farmers only knew how easy it is to install it, they would not be without it.

(Signed) HENRY D. CHARTER, Canada.

Used 12 Years and In Good Condition

Some 10 or 12 years ago, I bought quite a bill of Black Corrugated Roofing from you, and only painted it twice since I laid it, and it is in just as good condition today, as the day it was laid. Please send me your catalog, as I expect to put up a barn next Spring and am looking for something for a roof as good as that bought from you last time. (Signed) W. W. STODDARD Ohio.

Will Order More

Am pleased to say the roofing all here and in splendid shape. Allow me to congratulate you on prompt delivery. You will receive more orders from me. (Signed) D. DUCELLO.

Recommends Our Paint

I have used your Premier Paint in this salt atmosphere for the past four years and find it better for this climate than any paint I can buy, no matter what the price. (Signed) W. A. WEIDE, Florida.

$13 BUYS COMPLETE BATHTUB

This is a white enameled, cast iron, one-piece, heavy roll rim bathtub; fitted with the latest style nickel-plated trimmings, including Fuller double bath cocks for hot and cold water, nickel-plated connected waste and overflow and nickel-plated supply pipes. It is 5 ft. long and is good enough to answer the needs of any one. Lot 5CD-101.

Hot Water Heating Plants

We are headquarters for steam, hot water and warm air heating plants. They are suitable either for new or old homes. It is easy to install one of these plants in your old building. For this great Fall Sale of ours we are offering a warm air heating plant large enough for the ordinary 5 room house, with all necessary plans and complete instructions for installing, for $45.00.

Iron Pipe and Fittings

Good iron pipe in random lengths complete with couplings, suitable for gas, oil, water and conveyance of all liquids; size 3-8 to 12 inches; our price on 1-in. per foot 3c; 1 1-4 inch at 4c per foot. Complete stock of valves and fittings. Send us your specifications.

Growing Early Vegetable Plants.

By Prof. Paul Work, College of Agriculture, Cornell University.

At no time of the year are vegetables so prized as in the spring time and early summer. The housewife is eager to offer the "first of the season." Those who surround her table partake of the things her market basket affords with a keener relish than is enjoyed during the later months. Thus is it profitable for the commercial gardener to increase the cost of production in order that he may serve the early market. Thus does the home gardener take special pride in the speedy maturity of the first fruits of his labors.

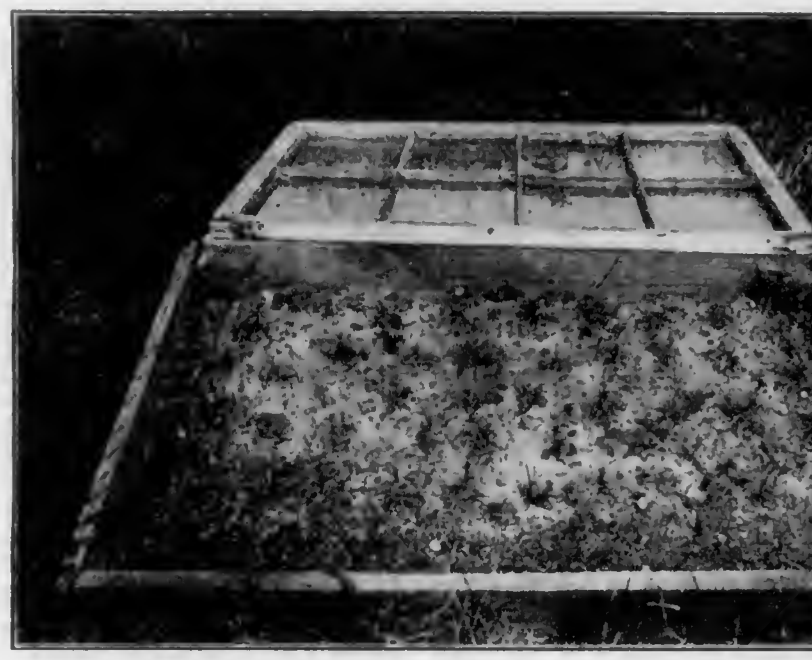
Many factors contribute toward early maturity of crops; climate, elevation, exposure, variety and strain of seed, character of soil, fertility, and care, all have their bearing. But the skilful garden strategist may steal a march and outflank his neighbor even tho many of these factors are against him; and if they favor him, he is well nigh invincible in the campaign for the good graces of the consumer. He may make his sowings under glass or in the house, and by the time the soil and season favor, he may be ready to set out of doors not a dormant seed, but a well grown plant. He gains not only in earliness itself, but he is assured of plants with a better root system than would otherwise be possible. With some crops, as the tomato, it is said the total yield is increased by the handling.

It must be clearly understood at the outset that different circumstances make desirable wide differences in practice. The methods of one grower vary widely from those of another. Perhaps the most important factor of all is keen watchfulness for differences and changes in the condition of plants. If one part of a block of plants seems not to grow so rapidly as another, the attendant goes at once in search of the cause and modifies conditions as may seem best, and may thus check the trouble before it is even visible to the uninitiated.

The greenhouse is to be preferred for the early starting of plants. It may be a large structure where plants are grown by thousands, or it may be a little manure-heated house of sash, or a lean-to by the side of the dwelling. When the number of plants is to be small, or if capital is lacking, hot beds serve well, and the usefullness of the kitchen window is not to be forgotten. In any case, there ought to be a cold frame for hardening the plants preparatory to setting them in the field.

The whole indoor life of the plant may be spent in the soil of raised benches or ground beds. Part of its life may be so spent, and then it may be set with others in a flat or plant box, or it may stand alone in a pot of clay or paper or in a berry box, or in a tin can from which the ragged top has been melted. Going still further, the seed may be sown in a vessel such as of, the last mentioned group, and it may remain there. The determination of these questions will depend upon the vegetable to be grown, upon the labor and space available, and upon the ideas of the grower.

Soil for plant growing ought to be of the finest physical quality. It should be prepared and stored in the fall. A sandy loam is best. In any case, and especially if a heavier type must be employed, an abundance of well-rotted manure or other humus-making material should be thoroly incorporated. A soil so prepared will absorb water readily and will hold it well, points which are exceedingly important in any phase of gardening and doubly so in growing plants. An over-abundance of fertility is not to be desired. A moderate amount is more conducive to hardiness and a stocky growth.



CONVENIENT FORM OF COLD FRAME FOR STARTING OR HARDENING VEGETABLE PLANTS

THE RESULTS SECURED IN SUCH A GREENHOUSE CAN BE DUPLICATED ON A SMALLER SCALE WITH WELL MADE HOT BEDS AND COLD FRAMES

Observe every precaution to secure a soil free of disease. The dangers from club root of cole crops, including cabbage, cauliflower, etc., and from damping-off fungi are especially serious. On account of the latter, old greenhouse soil ought not to be used without sterilization unless the grower has had no previous trouble, and even then a close watch should be maintained.

The next requirement is good seed. The cost of early crops is heavy, and one cannot afford greenhouse space for seed of poor germination or seed which will not produce good results in the field. In no case should seed be planted without previous testing. The time of sowing seed can not be arbitrarily determined. It will depend upon local conditions, upon the nature of facilities for plant growing, and upon the methods used. Experience is the only reliable teacher, altho valuable suggestions can often be gathered from neighbors. To secure strong, stocky cabbage plants in a section where outdoor setting may take place just after April 15, sowings may be made about February first. Tomatoes may be sown about a month later if it is desired to set large plants in the field. If smaller plants are preferred, sow later. Cucumbers and melons require only four or five weeks under glass. These suggestions are, however, general, and may be modified to meet special conditions.

With seed provided and soil ready, the next step is sowing. Many prefer flats because they are conveniently moved and because the shallow layer of soil permits an easy control of moisture relations. Thus, if a heavy watering is given and then in a few hours it becomes cloudy, and remains so for several days, the soil in the flat will not so long remain cold and soggy. It is usually better to sow in rows because the seedlings help each other thru the soil, and are more easily removed for transplanting without serious disturbance of the roots. It is also possible to water between the rows, thus avoiding chilling and danger of damping-off.

The rows should be marked off carefully and regularly. The corner of a square stick is very satisfactory for this purpose. Care should be taken to distribute the seed evenly. A thimble whose capacity has been modified with wax in the bottom makes a good measure for the smaller seeds, and other similar measures may be devised. However, many planters depend upon the eye for the necessary regularity. Eight to twelve seeds per inch of the smaller sorts are commonly sown, while melons and cucumbers should be spaced more thinly. There are two common methods of sowing. To work the seed over the forefinger by means of the thumb is common practice and is speedy for the expert. The envelope method is soon learned and skill is soon attained. A small amount of seed is placed in an envelope cut the short way. This is held in a flat position with the opening along the row, and the seed is evenly distributed by a gentle motion in the direction of the opening.

An even and firm covering is essential to a uniform stand. The depth varies with the kind of seed. In the greenhouse few need go deeper than one-quarter inch, and delicate sorts, as celery, should be barely covered. These latter may have the protection of cloth or burlap at first. This must be removed as soon as the seedlings break ground. Otherwise, in a day or so a lot of weak, white and spindling plants will result.

The successful care of seedlings until ready for transplanting is a matter of experience. Rules for watering and ventilation cannot be laid down, yet upon these success depends. In most cases the ideal calls for a plant that is short, sturdy, tough, and of comparatively dark color. To this end, the growth should not be too rapid. High temperature, lack of ventilation, too much water, and shade, all favor the damping-off fungus, and they favor a weakling growth. Too little water or a very low temperature stunts the plants, and with some especially the effect of a check is not outgrown for months after or even during the entire history of the plants.

Plants of cool season crops do well at 50 to 60 degrees by day and 10 degrees lower at night, and warm plants, as tomatoes and melons, may be kept 10 degrees warmer. The temperature should be higher during germination than afterward.

Farm Crop Notes

By
R. P. KESTER

Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Farm Help

Queries continue to come in asking where farm help can be obtained. As stated before in this department, the lack of sufficient labor to properly work the farms is the most serious limiting factor to more extensive and intensive farming in this country. It was no common sight last harvest to see the work being done by the farmer, assisted only by children and women. An old gentleman who has been farming for 50 years said to me one day that he always made most money during panics and periods of "business depression" since it was possible at those times to get the necessary help. This, he said, was not due to lower farm wages paid at such times but because some men will work on farms when they can get nothing else to do, rather than starve.

There is evidently but one way to solve the farm labor problem, and that is for farmers to get together in every neighborhood and work it out in a co-operative way. A great many people that come to this country from European countries come from agricultural regions and are accustomed to farm work, as it is done there. They make good help and good citizens if not herded together in the contaminating influence of a city environment. Heretofore, the greater part of this labor has been diverted into other business as soon as it landed here, even if not lawfully contracted for before leaving the other side.

European people are accustomed to community life and they will not stay in the country isolated from each other. Why should not the farmers of a given neighborhood build a number of tenant houses at one place, making a little village, and providing a lot for each family of a quarter acre or a half acre of ground? It is useless for us to expect a return of the old days when a farmer could hire his neighbor's boys and thus get sufficient help to run his farm at full capacity. Changed conditions have made that a thing of the past, and we may as well make up our minds that we will have to solve the labor problem as other business men have solved it, that is, by providing reasonably steady employment and furnishing homes to live in.

Difficulties of Rural Improvement

A letter was received the other day from a farmer who evidently has the blues badly. He asks why men in other callings can get help, advice and favorable legislation so much more easily and quickly than can farmers. He asks if farmers have no real leaders; if we have, are they on to their job? He hopes that the time is not far distant when a real Moses will come forward and lead us out of the wilderness.

This letter was interesting reading. Having just finished a good dinner in the midst of a much needed vacation, it produced no bad effects. I am glad the good brother wrote it. I am sure he feels better now. There are wrongs to be righted and improvements that must be made, and the first step in that direction is for farmers to realize that the job of bringing these things about is up to themselves. We have the numbers and the strength. What we need most is to use them intelligently.

I remember a great, big, overgrown boy who was a schoolmate when I was a lad. He had the physical strength but lacked the moral courage to take care of himself. The little fellows picked at him and teased him and otherwise made his life miserable, when he could easily have put the whole pack of his little tormentors to flight and thus gained their respect instead of their contempt. He was the scape-goat for the bunch and often got the blame for the other boys' mischief. This is not given with any attempt to excuse the actions of the small boys, and yet their actions were possible because the big boy did not do his duty and exert himself.

Yes, there are men, and women too, who are laboring just as earnestly and honestly for the betterment of farmers and agricultural conditions as did Moses of old to bring his people out of bondage. But the simile may be carried further. Moses was forty years making that short journey because his people were rebellious, stiff-necked, were of divided purpose, and would not unite with a common mind for a common purpose. Hence, their progress was slow.

In addition to these things there are certain physical and sociological reasons why the work of advancement is slower with agriculture. People who follow other callings have more nearly similar conditions of life, work and experience than have farmers. Whether they be miners, iron-workers, factory hands, lumbermen, bankers, merchants, manufacturers, or what not, all those engaged in a particular calling have more or less similar work, similar experiences, similar needs, similar homes and similar ability. But there exists the widest possible difference in all these things among farmers. Farming is engaged in by every race of people, in all parts of the earth, with a wide range of customs, productions, climate, altitude, soils and intellectual ability. For these reasons it is more difficult to make laws, plans and regulations, etc., that will be helpful and satisfactory to all engaged in it than it is to do these things for any other class. These same differences explain why it is more difficult to find common ground upon which to organize and to work for class improvement.

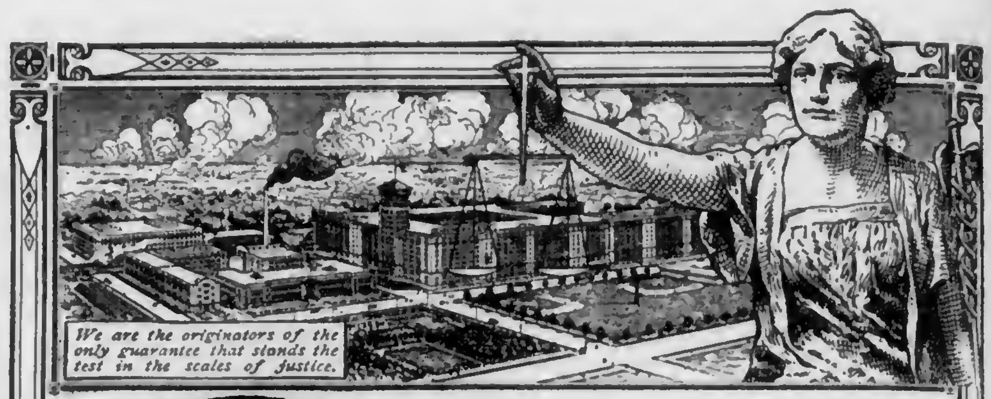
However, the work is going steadily on. Farmers must learn to distinguish between the true and the false; between the self-seeker and the real leader; between the demagogue and the statesman.

Fertilizing Potatoes.

C. A. W., York Co., Pa., writes, asking several questions concerning the application of fertilizers to potatoes, and wants to know where he can procure a machine for distributing it between the rows after the potatoes are up. He expresses a fear that much fertilizer is lost by leaching when it is applied before the potatoes are planted. Last year he applied 1200 lbs. per acre of a 2-8-10 mixture and had fairly good results. This year he proposes to apply 1,500 or 1,600 pounds, and would like to have a distributor that would apply about 500 lbs per acre at a time, cultivating it into the soil within four inches of the stalks. He plants in rows 30 inches apart and 12 inches in the row.

Some of these questions were discussed in a very recent issue of Pennsylvania Farmer, printed since this letter was written. Our friend need have no fear of the phosphoric acid and potash being leached if it is all applied to the soil before planting. If the nitrogen applied at that time is mostly of an organic material, like dried blood or takage, little will be lost, especially if a moderate amount is used. Where heavy applications of nitrogen are necessary it is preferable to give one or two applications of nitrate of soda after the potatoes are up and work it into the soil. In fact, this practice has brought better and more economical results at the Homestead Farm than the very heavy applications of a complete fertilizer. We could not get profit from more than 900 lbs. of fertilizer per acre on ground in fairly good condition, the potatoes being preceded by a clover crop. If our correspondent will increase the percentage of phosphoric acid, he may get better results and cheaper than to increase the whole amount. This has been found true on a good many Pennsylvania soils.

I do not know of any satisfactory machine for distributing between the rows, other than the one named by the inquirer. We apply nitrate of soda by hand, scattering about 100 pounds per acre and following with a cultivator. The material should not be allowed to fall on the plants when the leaves are wet.—R. P. K.



We are the originators of the only guarantee that stands the test in the scales of justice.

David Bradley Tongueless DISC HARROWS

Thousands of progressive farmers agree with us that the David Bradley Tongueless is the finest disc harrow made. Built up to the highest standard of quality and *sold at a price that makes it the greatest value obtainable.*

Always remember that you are the sole judge of your own satisfaction when you try a Bradley Implement.

The complete line of *Bradley Disc Harrows* (more than *forty* styles and sizes), are shown in our big General Catalog, but if you want our new Disc Harrow and Implement Book which also describes the complete line of Bradley cultivators, plows, spreaders, planters, etc., besides, buggies, wagons, harness, gasoline engines, supplies for dairymen, poultrymen, fruit growers, etc., just say "Send me Disc Harrow Book No. 84P77" on a postal card and mail to

THE Bradley Disc Harrow advantages mentioned below, and many others, are fully explained in our new Disc Harrow and Implement Catalog No. 68F77, sent free on request.

Heavy all steel frame, rigidly braced. Flexible gangs (operated by convenient independent levers) can be set at any angle. Discs cut uniform depth because they are held in place by an adjustable steel yoke. Low hitch, perfect balance and direct pull from gang bearings mean *light draft.* Forward truck relieves horses from neck weight. Bearings run in oil soaked maple boxes and are lubricated by *hard oil cups.* Scrapers operated by foot levers easily reached from seat. The Bradley Patent Spring Seat Post, found on no other make, means comfort to the rider.

Hard Oil Cups at Gang Bearings.

35 BUSHELS PER ACRE was the yield of WHEAT

160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard is now the owner of 320 acres of land. In 1913 had a crop of 200 acres which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abondant one everywhere in Western Canada.

Jacobson Engines Sturdy Jack

A sturdy little 2 H. P. Engine. Just the thing for scores of farm jobs—pumps, runs the wood saw, separator, washing machine, etc., and all the lighter machinery. Pumps 2,000 gallons for a cent. Starts easy and sure. Mounted on hand truck—push it around like a wheelbarrow. Runs without fastening. Firm as a rock. Does *not* have to be propped up. Air or hopper cooled. Material and workmanship—faultless! Price—reasonable! We also manufacture engines up to 60 H. P. for heavier work.

Write us today—tell us your needs

JACOBSON MACHINE MFG. CO. DEPT. C, WARREN, PA.

POWER SPRAYER *for Moderate Size Orchard*

A 100 gallon business outfit. 200 pounds pressure with 6 to 8 nozzles. 2 H. four cycle air or water cooled engine, double acting pump, sediment chamber. Hemp packing, ball valves, easy to get at. One of 70

IRON AGE

Bucket, Knapsack, Barrel, Power and Traction Sprayers. Ask your dealer about them and write us now for new Spray book, spray information and Iron Age Farm and Garden News.

State Board of Agricultur
Meeting.

The 37th annual meeting of the Pennsylvania State Board of Agriculture was held January 28 to 30. Secretary N. B. Critchfield this year introduced a new feature which proved highly successful and made the meetings better than ever before. He arranged with 16 chiefs of the various departments of the state government to make short addresses covering the work now being carried on by them, especially as it related to the farming interests. This gave the members of the Board, which is composed of one representative from each county, an opportunity to get a comprehensive idea of the governmental activities of the state.

Good Roads.—Governor Tener in his address at the opening session made the first mention of the good road question. Among other things he said "the people showed at the last election that they did not approve the bond issue as the correct means of raising money for road work. Now, if you have a better plan, let us have it. If direct taxation is the proper thing how shall we go about it? We have a comprehensive plan of building and now we must have a feasible plan of finance."

The report of the standing committee on Roads and Road Taxes mentioned the fact that "petty politics" are being played in too many places at the expense of the roads, and also that a lack of money and general ignorance on the subject are holding back the work. Commissioner Bigelow did not see fit to join the heads of the other departments in addressing the meeting, but sent one of his deputies, E. A. Jones, who read a paper on "Relation of Public Highways to Agricultural Pursuits." This was a great disappointment to many members of the board because Mr. Jones brought out little that was new or pertinent to the subject.

A committee was appointed to confer with the highway department and get information on the road question. This called forth considerable debate as some wanted the committee to report the following day and others wanted a report at the May meeting. It was finally decided to have both. The committee made a short report recommending that the board co-operate with the state board of Public Charities and ascertain if some of the money now appropriated for semi-state institutions could not be appropriated for roads, and also that it was the sense of the committee that not less than $3,000,000 a year should be appropriated for township roads. The work of the committee was continued. It will give the matter a thoro study, holding a number of conferences at Harrisburg with the various departments and officers, and will be expected to give a complete and tangible report at the May meeting. In a resolution the Board favored the passage of the Shackelford bill, now before Congress.

State Police.—Possibly the question which created the greatest interest aside was the work of the state police. Captain John C. Groome, superintendent of this force, made an able address on "Police Protection to Rural Districts." The force is now composed of 220 mounted men who last year traveled 191,000 miles of road and made 1,141 arrests. Little is heard about this work except in a case of strike or riot, which is the least of the police duty, as shown by the fact that last year only 10 arrests were made for riot. Last year 2,292 requests for assistance were received from small towns and rural districts, but due to the small appropriations made for the work only a small proportion of them could be granted. Two hundred men are sufficient to cover the parts of this state which can not afford proper police protection. Politics are unknown in the state constabulary and only the best men are picked for service after a mental, moral and physical examination and four month's probation in the training school.

Taxation.—Hon. A. W. Powell, auditor general of the State in his address on "The Farmer and Tax
presented an entirely new pha
this question when he stated t
his opinion taxes should be lev
cording to the ability of the cit
pay. This brought forth cons
discussion and while Mr. Pov
mitted that the question of wh
be judge of a man's ability
was the great problem to be so
wanted his audience to get aw
the old idea of regarding the
tution as sacred. He advised
ful study of Article 9, which d
this subject and to decide
just because our forefathers h
down to us as the law that w
continue to hand it down as
and only way to do this i
work.

Fish Culture.—The possibi
an acre of water on the farm i
ing food was clearly shown
N. R. Buller, Commissioner of F
in his address on "Fish Cultu
Source of Profit to the Farmer.
Buller recommended the Blue G
common bull head cat fish as th
for this purpose. The ponds nee
be deep enough so that they wi

addition to the state officials alre
mentioned the following addresses w
heard by the Board: "The Waters
Pennsylvania," by Hon. Samuel
Dixon, Commissioner of Health, "Carrying the College to the People," by Prof. M. S. McDowell, State College; "The Publicity End of the State Government," Hon. A. Nevin Pomeroy, supt. public printing; "Progress in the School and on the Farm," Dr. N. C. Schaeffer, supt. public instruction; "Better Schools a Pressing Need of Agriculture," Hon. Henry Houck, secretary of internal affairs; "Institute and Advisory Work," Hon. A. L. Martin, deputy secretary of agriculture; "Labor and Safety Laws of Pennsylvania," Hon. John Price Jackson, commissioner of Labor and Industry; "The Farmer and Legislation," Hon. Wm. M. Hargest, attorney general's department; "Fire Prevention," Hon. Jos. H. Baldwin, State Fire Marshal and "The Value of Bird Protection," Dr. Joseph Kalbfus, secretary game commission.

Commodities Act.—The injustice of the recent law making 50 pounds the legal weight of a bushel of apples was commented on by Prof. H. A. Surface. He stated that the average weight in this state of a measured bushel is from 40 to 43 pounds and that some early varieties weigh as little as 38 pounds. Under these conditions in some instances it will be necessary for the farmers to give a peck of apples free in order to comply with the new law.

Resolutions.—The Board passed a resolution instructing the legislative committee to work for a law requiring all commercial fertilizing tags to specify the sources from which the nitrogen, potash and phosphoric acid were obtained. This is aimed for one thing at the large amount of leather scraps now used in some mixtures, which altho containing nitrogen is of little use to a plant. A resolution was passed favoring Philadelphia as the place for the national corn show in 1915. A resolution offered regarding the places most suitable for supervisors conventions in connection with the highway department was held over until the May meeting.

The annual election of officers resulted in the selection of B. F. Killam, of Pike, J. H. Wilson, of Clarion and S. C. George, of Indiana as vice presidents for the coming year. A new executive committee was also elected as follows: A. V. Gormey, Jean K. Foulke, S. S. Blyholder, H. G. McGowan, John Schoener, W. F. Holtzer, J. Newton Glover and G. F. Barnes. The regular May meeting of the Board will be held at Stroudsburg in connection with the annual normal conference of the farmers' institute lecturers.—W.

when buyer and seller, grower and planter can meet together and discuss their troubles. More than this, those producing the highest grade selected can personally meet those who will buy and plant it. In this manner there will come into the best seed trade the element of personal responsibility between the grower in the North and the planter in the South, and the success of many of the southern growers will in a large degree depend upon the closeness of the personal contact they have with those who produce the seed they plant. Every large grower should plan next year to meet the man who produces the seed he is to plant at the next Maine Potato Day, in December 1914.—E. A. Rogers, Cumberland Co., Me.

INTERNATIONAL Harvester manure spreaders have a score of good features in their construction. Each one is the result of careful field experiment.

An I H C spreader is low enough for easy loading, yet it has plenty of clearance underneath. The rear axle is well under the load, rear wheels have wide rims and Z-shaped lugs, insuring good traction under all conditions. Frame, wheels, and all driving parts are of steel. Apron tension is adjusted by a simple device. Winding of the beater is prevented by large diameter, and beater teeth are strong, square and chisel-pointed.

International manure spreaders are built in several styles and sizes, low or high, endless or return apron, for small farms or large. Examination will show sturdiness of construction in every detail. Repairs, if ever needed, may always be had of the local dealer.

Examine International spreaders at the dealer's. We will tell you who sells them, and we will send you interesting catalogues.

ALWAYS Mention PENNSYLVANIA FARMER —When Writing to Advertisers.—

WESTERN NEW YORK HORTICULTURAL SOCIETY

The meeting of the Western New York Horticultural Society was held at Rochester, January 28-30, with an attendance of 1,500 fruit growers.

President Barry in his address spoke of the care necessary in orchard practice in these times especially as regards spraying and cultivation, picking and packing, in order to meet competition.

Fruit Industries of New York.—Calvin J. Huson, Commissioner of Agriculture, traced the growth of the fruit industry in New York and brought out some interesting facts and figures, as to its present extent.

A Ten-Acre Orchard.—Prof. Hedrick, of the New York State Experiment Station, spoke upon "The Outgo and the Income of a 10-acre Orchard." He remarked that very few in the audience knew what their assets and liabilities actually were, and that many have gone into the fruit business having been encouraged by highly-colored reports. In keeping accounts the ten-year basis should be taken into consideration. Allowance must be made for interest on investment and depreciation of equipment and tools. The items in the cost of a barrel of apples are as follows: Interest on investment, $.21; taxes, .012; tilling, .063; pruning, .03, spraying, .096; cover crops, .023; superintending orchard, .25; picking, packing, sorting, handling, .244; cost of barrel, .36, total cost of barrel of apples, $1.29. Average selling cost, $2.60. Net profit, $1.31. The dividends from an acre worth $1,500, is 8¾ percent.

In this orchard, where both sod and tillage have been practiced, portions which have been under tillage returned for every dollar from the sod trees, $1.54, thus proving that tillage is more profitable. High color and size are antagonistic. The quality of cultivated apples is higher if anything. Potash is the least needed fertilizing element. If commercial fertilizers are used it is best to experiment and see if you are getting your money's worth. Acid phosphate is the most available form of phosphorus.

Farm Bureaus.—Lewis A. Toan discussed the Monroe County Farm Bureau, explaining that the farm bureau is the connecting link with the agricultural college, the experiment station and the farmer. It brings the agencies together. The agent visits the farmers upon request, at no expense. If he is not able to help he will send to the college, or other source.

Soil Fertility.—Dr. Jacob G. Whitman spoke on the question of "Soil Fertility." The following is from his address: "One of the most important points in obtaining the best quality of fruit is the location. The soil should be loose. The elements taken from the soil by the orchards must be considered in buying commercial fertilizers. The composition of the soil may be ascertained from the experiment station or agricultural college. The proportion of organic matter in the soil must be considered, for in this organic matter or humus, nitrogen is stored in the soil. There is no other factor in apple growing that is so important as the storing of water in the soil. Only about half of the rainfall is available for the crops as some is lost by evaporation, drainage, etc. There is not enough rain stored in the soil during the growing season, and water must be stored from the spring rainfalls if a good crop is expected. Humus aids in retaining water in the soil. With ordinary culture there is not enough organic matter kept in the soil. If a sod is left to itself it will gain organic matter. This does not prove that the soil needs a rest, as the humus may be supplied by cover crops and barnyard manures.

"It has been ascertained that there is a direct relation between lime and the quality of the soil. Lime also aids in the circulation of plant food in the soil. Lime converts the phosphate into available form. Altho trees may seem to grow well for a time without an application of nitrogen, yet sooner or later the growth of the trees will be checked by the lack of available nitrogen. For obtaining phosphorus the best source is acid phosphate. Basic slag is also satisfactory as it is as cheap as phosphate, namely about $12 per ton. Acid phosphate stimulates the soil activity to a very great extent. It may be used to advantage with lime. Plants suffering from lack of available potash are more easily destroyed by fungus. Acid phosphate does not make soil poorer, except as it makes other soil properties available and it does this by feeding the plants. Nitrate of soda should be applied early in the spring a few days before the trees begin to grow, as it is immediately available. Cover crops use up a large amount of moisture, thus competing with the trees. They may also stimulate undue wood growth and make the trees susceptible to diseases."

European Contribution to Agricultural Progress.—Dr. W. H. Jordan, Director of New York State Experiment Station said that it is an admitted fact today that production is not keeping up with consumption. Only 27 percent of tillable land is under cultivation. Because the profits of farming are not great enough the farmer is not justified in producing large crops. The price paid by the consumer must be larger than that now paid, but this difference may be reduced if the consumers buy their products in the most economical way. Goods are not standardized so the consumers may be certain they are getting high-class produce. The credit methods of European countries where small rural communities are organized for the purpose of lending money to the farmer upon liberal terms, these credit associations being controlled exclusively by farmers, cannot be duplicated in the United State owing to conditions here being very different. Scarcely any machinery is used in European communities as they are small farmers. They are submissive to authority and can stay banded together.

Parcel Post and the Farmer.—George T. Powell pointed out the necessity for a better system of direct dealing between consumer and producer. The greatest stumbling block in this particular is the lax methods of marketing in which products—good, bad or indifferent—are sold to a commission man and whatever he gives in return is accepted. He suggested that fruit growers first organize a society in a community or town, and afterward band together in a large organization, pointing out the necessity for all the members being bound by a contract to stand by the organization so that some of them be not tempted by a little higher price than they could get otherwise, to step aside. He pointed out the necessity for market places in every city where the consumer may buy direct from the farmer. Since the retail dealer must buy in large quantities products should be grown so that they may be sent by carloads.

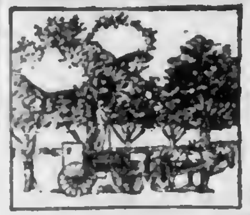
Co-operation.—J. T. Bush emphasized

HURST SPRAYERS ON FREE TRIAL

NO MONEY IN ADVANCE—NO BANK DEPOSIT—PAY AFTER IT HAS PAID FOR ITSELF.

LET US SEND YOU ANY OF THESE SPRAYERS—to try for 10 days, then if you buy, you can pay us cash or we'll wait till next fall for our money.—The extra profit will more than pay for it. We pay freight.
LOWEST PRICES. HIGHEST QUALITY. 5 YEAR GUARANTEE.

Quality Sprayers for every purpose. Man Power and Horse Power for field and orchards. Barrel and Power Sprayers all give high pressure and produce vapor spray that kills scale, prevents blight and scab, and rids your crops of all fungus and insect pests. Hurst Sprayers have brass ball valves and all the working parts that come in contact with the solution are made of brass. Cyclone agitation insures an even distribution of the spraying materials and best results. These sprayers are made by practical men who know the needs of the fruit grower and farmer and know what a sprayer should do. Our 27 years' experience in the manufacture of sprayers, together with the capacity of our large factory, enable us to build the very best sprayers at the very lowest prices. We guarantee our sprayers for five full years and ship on free trial—no money in advance. That's evidence of quality. Get our big FREE BOOK—"Why, How and When To Spray"—Contains 76 illustrations of insect and fungus pests and gives remedy for each. Also shows 28 different styles of quality sprayers for every purpose. Write At Once



FREE You can get a Hurst Sprayer absolutely free if you are the first in your locality this season to send for one of our sprayers for trial. You need do no canvassing or soliciting. It will only take 15 minutes of your time. We do the work. When you get a sprayer from us you get the benefit of our 27 years' experience in manufacturing sprayers. Hurst Sprayers won the gold medal at the National Horticultural Congress spraying machine contest. Send us a postal or mark the attached coupon and mail it to us and we will send you our fine catalog, spraying guide, and will tell you how you can get a sprayer free. Don't delay, write us at once for our free sprayer proposition and save money.

DEMING PUMPS THE WORLD'S BEST

The Deming "Victory"

excels in all those points in which other Power Sprayers are deficient. It is the sum total of 30 years' experience in making pumps and spraying outfits. We have successfully marketed several power spraying rigs. All have made good, and done all we guaranteed they would do. But for simplicity of construction, ease of operation, durability and efficiency it will prove difficult to beat this

Climax in Power Sprayers

The Deming "Victory" will meet the demands of the most exacting horticulturists. Its strongest features are an unusually large air chamber which insures a uniformly strong pressure of 200 pounds per inch; the 200 gallon tank provides ample capacity, while the practical construction and light weight of the outfit make it easy to handle. With pump, engine, tank, frame, "Deco" hose, bamboo extension rod and famous Deming Nozzles, we consider the "Victory" the most complete spraying outfit on the market to-day. Write for

Complete with Simplex Nozzles, "Deco" Hose and Bamboo Rod.

Instructive Spraying Guide

It's free! Tells when and how to spray in garden, orchard and field. Catalog describes over twenty styles of Deming Spray Pumps. Most good dealers sell them. If yours cannot supply "The World's Best," write us.

the advantages of the co-operative exchange because of its opportunities for handling fruit and obtaining prices above those secured by the ordinary fruit grower.

Forests.—Hugh P. Baker, Dean of New York State College of Forestry, at Syracuse University showed the possibilities of forestry in New York and made a plea for the conservation of the farm woodlot. The rapid-growing evergreen trees, according to Dr. Baker, as spruce or pine, are the most profitable, since wood in these times is not now needed for strength, as concrete, steel and brick are more often used for building purposes. If creosote is applied to these soft woods when they are used for out-of-door purposes it will prevent decay and make them nearly as durable as harder woods.

Apple Production.—Prof. S. A. Beach, of Iowa State Agricultural College, who spoke on the "Outlook For the Apple Industry," illustrated his talk by lantern slides. He said production per capita had decreased nearly two-thirds.

Peach Growing.—George Friday, of Coloma, Mich., gave his experience in fruit growing. His peaches were grown on gravelly clay loam soil. His great trouble was with nursery stock. He cautioned against storing trees in a damp cellar for fear of mildew and advised home grown nursery stock. He said fall planting is best, in some localities. Setting trees in nursery rows and transplanting them later prevents stunting of growth thru change of soil. Holes for trees may be dug in the fall, filled with manure, which is taken out in the spring, care being taken not to have the soil so wet as to cause it to pack when trees are planted. Begin cultivation soon after planting.

Little but formation pruning should be done at the beginning. At about the fourth year, the trees are so pruned that all of the fruit will get a plentiful supply of sunshine. Peaches are headed low enough that about seven-eighths of the crop can be picked from the ground. Spraying for leaf curl should be done before the buds have started. It is essential to have a cover crop, as sooner or later the sod will need more humus. Stable manure is applied to supply nitrogen. This is usually placed just around the trees. All fruit should be under cultivation by the 15th of May. The Forkner harrow, 15 feet wide, is used for cultivating 18-foot rows. Thinning has been found profitable and should be commenced as early as possible. Picking is one of the most troublesome problems. Fruit is picked in half bushel baskets and not emptied. It is better to pick too soon than too late, as some fruit must be sent long distances.

Forms of Nitrogen.—"New Nitrogen Fertilizers" was the subject of an address by Dr. James A. Bissel, New York State College of Agriculture. He said that the supply of nitrogen is practically inexhaustible as it composes about four-fifths of the atmosphere, but that it must be made available. Nitrate of soda, sulphite of soda, beef scraps, and dried blood supply this element. He stated that the artificial sources of nitrogen will at the present rate of increase of consumption be exhausted in a comparatively short time. In manufacturing nitrogen from the air, the first process is the formation of nitric acid, which is combined with lime to form Calcium Nitrate, this compound containing about 12 percent nitrogen. One disadvantage is that it absorbs so much water that the cost of transportation is prohibitive. The second process results in the production of calcium cyanamide, containing about 15 percent nitrogen and 25 percent slate lime. One plant in America for producing it is located at Niagara Falls. These plants to be successful must be located near some kind of water power so the electricity needed may be cheaply generated. The calcium cyanamide is not suitable for top-dressing as it is not carried into the soil very easily by the rain and it is also poisonous to vegetation. It compares favorably with other forms of nitrogen. When the calcium cyanamide is mixed with acid phosphate it makes part of the phosphate unavailable. The nitrogen in peat has little value in comparison with other forms. A German investigator found out that certain plants are capable of taking nitrogen from the air—namely the class of legumes. There are also certain bacteria in the soil which take nitrogen from the air.

The fruit exhibit was in large part much like the one at the New York State Fruit Growers' Association two weeks before, also the display of machinery. W. C. Barry was re-elected president and John Hall, secretary. The next summer meeting will be held at Plattsburg, near Lake Champlain.—W. H. Jenkins, Delaware Co., N. Y.

Poultry

WINTER EGG PRODUCTION

The demand for strictly fresh eggs during the late fall and early winter far exceeds the supply. For this reason they sell at high prices, and poultry raisers who are able to make their hens lay at this season of the year reap rich rewards. In order to secure laying fowls it is necessary to keep in mind several fundamental precautions: 1. Have a heavy laying strain. 2. Use only early hatched fowls. 3. See that birds have careful housing. 4. Give intelligent care in the Spring. 5. Use proper feeds.

To make a success of winter egg production it is absolutely necessary to have a heavy laying strain of fowls. Get a strain of fowls which has been bred for several years for egg-production rather than for show purposes. Until we poultry men come to realize that egg laying is the foundation of the poultry business instead of fancy feathers, we will not be able to make poultry husbandry what it should be. Remember that in the strain there lies more importance than in the breed. One may get a certain strain of fowls, which are exceptionally good winter layers one year, while the next year he may buy a different strain of fowls of the same breed, which will show very little value as a winter egg producer even tho it may excel in show qualities.

It is rather hard to combine utility and fancy qualities in a single strain, to advantage. It may be done in the case of a few individuals but I have yet to see a large flock which excels both in the show room and as a market or egg-laying strain.

There is a fortune in the poultry business for the man who will devote time, money and work, toward producing a heavy laying strain of fowls, in almost any breed. This can only be done by keeping accurate records for a period of about six years or more and in this way discovering the heavy laying individuals, which by previous performance have proven themselves reproducers of heavy-laying individuals. Such methods require a little more time and money, more accurate records and greater perseverence on the part of the man behind the gun, but bring results in the end.

Early hatched pullets are the best for winter layers. Next to them come the yearling hens. The stock of the American class should be hatched during March and April, while April and May hatched pullets of the Mediterranean class are better as winter layers than if earlier hatched. If hatched too early the chances are too great that they will moult in the fall, in which case they are not much better than hens for producing early winter eggs in abundance. If hatched too late they will not mature before winter sets in and of course an immature fowl cannot be expected to be a very good winter layer.

Not only should winter layers be hatched early but they should be raised under natural conditions, which means giving them free range, plenty of shade, and common feeds. Don't make the mistake so many make, of yarding the poultry, to protect the garden. By all means fence in the garden even if it does take a few rods of fencing, and give the poultry the run of the farm.

Heavy layers must be constitutionally strong and only free range stock can be constitutionally strong. Pullets that have been in small yards never possess the vigor and strength necessary to stand the heavy strain of egg production.

Another point I wish to impress, is to hatch about twice as many pullets as are desired to keep over winter as layers, so that when fall comes there will be a large flock from which to select the pullets according to maturity, shape, vigor and size. The early maturing pullets, are generally the best layers, as are most of those that show large and early development of comb and wattles. They must, of course, have size and be constitutionally strong.

The next factor to consider is the matter of housing. Poultry houses should be so constructed as to provide a large amount of fresh air, an abundance of sunshine, and dry quarters; and they should allow for at least four square feet of floor space per bird. We have muslin curtains in all of our poultry houses. These we open and close with the rise and set of the sun, except on severe days, when they are left closed during the day time. With our average winters, we never have them closed all day long, oftener than about ten or fourteen days of the entire winter. If your poultry house is not equipped with some of these muslin drop curtains hinged at the top, I would earnestly advise a remodeling of the house to cover this feature. The best size of curtain is one about 30 inches wide by 5 feet long, located in the south as near to the roof as possible. Have the three ends of the poultry house, east, west and north absolutely air tight, and let all the fresh air during winter come in thru the south front. Allow no drafts in the poultry house and tolerate no dampness of any description. Dampness and drafts invariably cause colds and may develop roup.

It is well known that in spring hens produce eggs in abundance; in this natural laying season the fowls should have plenty of exercise, green food, grit, insects and a variety of grains, and a good winter egg yield is incompatible with conditions other than those obtaining during the abundant spring production. As a substitute for the spring exercise secured by the fowls in chasing bugs and insects, scatter the grain feed in winter in a very deep litter so that they must work for every particle they get. The litter should be 10 to 12 inches deep, of a good clean, dry and loose oat or wheat straw.

Our practice is to give water with chill taken off in the early morning. Give them enough to last until noon. Have the water dish always clean and sanitary. Next give them a feeding of a grain mixture made up of equal parts of corn and wheat. This feeding of the grains should be about half as much as they would eat if you gave them enough to fill up. Scatter the grain feedings in the deep litter and by the aid of a fork, work it well down. At noon they are watered again the same as in the morning. At this time one day they get a feeding of mangels, the next day a feeding of cabbage. This is alternated each day and only enough is fed to last until evening. All that is left then should be removed. They get a daily feeding of alfalfa hay or leaves, all they want to eat. In the winter time at about 4 o'clock in the afternoon give them their last feeding of grains for the day of the same mixture as in the morning, but at this feeding give them just a little more than they will eat up clean. The little that is left they will dig out early the next morning. They should go to roost with full crops. The last thing at night empty out all the water and milk dishes. In addition to the water they also have a dish of sweet skim or sour milk always before them.

A dry mash mixture of the following proportions is always before them in self-feeding hoppers: 3 parts by weight bran, 3 parts corn meal, 2 parts wheat middlings and 2 parts beef scrap. Grit and oyster shell are always accessible in self-feeding hoppers, hung on the wall. If you can get a fresh green cut bone give them a scarce feeding of it three times a week, but never feed tainted green cut bone or any other tainted food, as it deranges their digestive system, and does more harm than good. If you desire to force them for egg production it is a good idea to place a hopper full of beef scrap before them, so they can get it at all times.

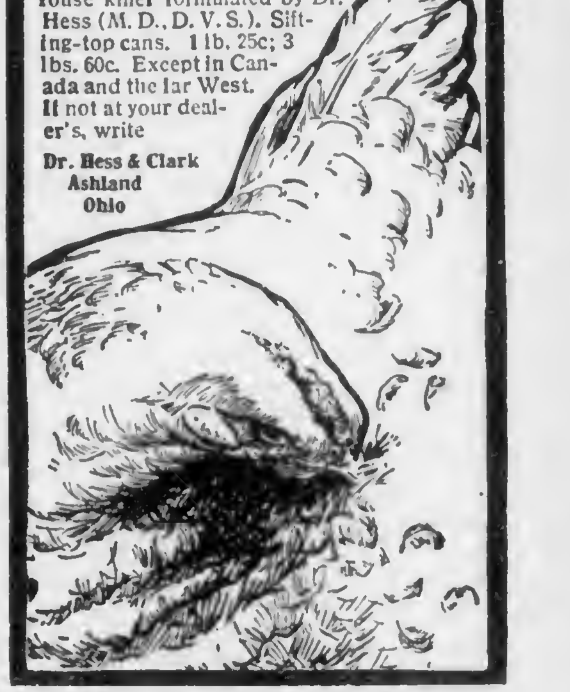
Keep everything clean and sanitary, by cleaning the droppings out daily, renewing the scratching material as soon as it becomes solid, damp and broken up. Watch the droppings on the roost platform carefully. If they appear loose decrease the mangels, cabbage and beef scrap and increase the alfalfa feedings. A feeding of charcoal at this time is of great advantage.—F. W. Kazmeier, Cornell University.

USING ROUP CURES

Potassium permanganate and several of the commercial roup cures combine chemically with tin or iron. The result is that when they are given in the drinking water, they eat holes in the pans and fail to do the birds any good. Where the water clears or changes color soon after putting the medicine in, when a tin or galvanized pail is used, the trouble can generally be avoided by using a crock.—Kansas Industrialist.

DR. HESS Instant Louse Killer

Kills Lice on Poultry and Farm Stock



It kills them *instantly*—as soon as it gets to them—that's why it's called *Instant*. It also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. See the name "Instant" on the can—that's the louse killer formulated by Dr. Hess (M. D., D. V. S.). Sifting-top cans. 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. If not at your dealer's, write

NINE OUT OF TEN "SICK" HOGS HAVE HOG CHOLERA

The Department of Agriculture is in receipt of frequent inquiries concerning methods for distinguishing hog cholera from other swine diseases. The specialists in hog cholera investigations answer these inquiries as follows:

Altho at first thought this matter of diagnosis appears to be of prime importance, in reality it is not so important or so difficult as it seems. It is estimated that at least 90 percent of all deaths of hogs from disease in the United States are caused by hog cholera. Therefore, in the case of any fatal outbreak, the chances are about nine to one that the cause is hog cholera. It is true that other infections may and do frequently complicate outbreaks of hog cholera, but in such cases the germ of hog cholera is the primary cause of the disease; and if we can take care of the germ of hog cholera the pig will usually overcome the other infections himself.

The symptoms exhibited by hogs sick of hog cholera are not sufficiently distinct from those produced by other maladies so that a positive diagnosis can be made only thru a careful consideration of a number of other factors in connection with the symptoms. From a practical standpoint the important thing is to recognize hog cholera as soon as possible after its appearance in a herd in order that anti hog-cholera serum may be applied before the disease progresses too far. Good serum may be depended upon to protect well hogs, and even to cure a large percentage of those in the earliest stages of the disease, but it will not be of much avail when used upon hogs that are already visibly sick. The following suggestions to farmers are offered as an aid to the early recognition of hog cholera in a herd.

1. Keep posted concerning the condition and health of hogs on other farms in your neighborhood. Sick hogs on a neighboring farm are a positive menace, for the germs of hog cholera are easily carried on the feet of men or animals.

2. Look over your herd regularly in order that any sick hogs may be promptly discovered.

3. If any hogs in the herd are found to be "off feed" or appear in anywise sick, separate them immediately from the remainder of the herd, and keep them and the main herd under close observation daily. If there is a tendency for the disease to spread in the herd the trouble is quite probably hog cholera. This diagnosis may be confirmed by killing one of the sick animals and examining the organs in the manner described in Farmers' Bulletin 379, which may be had free by writing for it to the U. S. Department of Agriculture, Washington, D. C.

4. When the first symptoms of sickness are observed an immediate change of feed sometimes corrects the trouble. This is particularly true of swill-fed hogs.

5. If there is any tendency for the disease to spread in the herd do not temporize, but immediately treat the herd with serum from your State Live Stock Sanitary Board. Prompt administration of the serum is essential to success.

7. Remember that hog cholera kills millions of hogs where other diseases kill thousands. Dismiss from your mind all thought of such diseases as "lung plague," "infectious pneumonia," "pig typhoid," etc., for these are generally merely fanciful designations given to hog cholera by uninformed men.

ONE OF THE BEST INVESTMENTS ON THE FARM IS THE PLATFORM SCALES. ECONOMICAL FEEDING IS IMPOSSIBLE WITHOUT FREQUENT WEIGHING.

PROFITS IN SHEEP

Several years ago I determined to keep sheep. My greatest trouble came in the form of a tramp or cur dog. But he never left the farm. I killed him and planted him without ceremony or flowers. I feel justified in that action and I intend to keep up the practice until county protection eliminates the pest. I have proved sheep to be the most profitable animal to keep on my farm, both from a meat and fertilizer viewpoint. Lambs finished early, February and March, demand the highest price for that grade meat. No other farm animals can be fed at the same average low cost.

I never mix mutton and wool. Either one is good. But mutton interests me most; that's why I prefer a Shropshire ewe and a Southdown ram. I do not insist that either be purebred, but they must show good. I buy ewes in July and breed them immediately. Early finished lambs sell at $10. I pasture the sheep in a field that will be turned under for corn the following year. Sheep eat weeds and their droppings make rich fertilizer spread at no cost to me. I never permit the ram to run with the ewes in pasture.

The sheep enclosure is well ventilated and faces the south. Doors and windows are screened with wire to keep out dogs. The outside enclosure where they get exercise and air, is also enclosed by wire, six feet high. I feed clover hay, fodder, cobmeal, oatmeal, mangles and roughage. And, when the lambs come, a small space is partitioned off for them and they are given cobmeal and oatmeal as a dry food. A finished lamb should wiegh 45 to 48 pounds, alive, in February or March. Winter or summer lambs do not interest me, because I can not compete with range stock which sells at a low figure.—A. L. R., Philadelphia Co., Pa.

SHOOTING HOGS

Many farmers slaughter hogs by sticking them and allowing them to bleed to death without first stunning them in any way, claiming that they bleed better and make better meat than when shot or stunned. It seems to me that this method is cruel and gives the animal unnecessary pain. Sometimes shooting causes the shoulders and neck to be somewhat bloodshot, if too large or too powerful a gun is used, but if a small rifle of the proper power is used this is not necessarily so.

Another very good way is to stun the hog with a sharp blow in the forehead just above the eyes. It can then be stuck with the knife and the hog will bleed as well as if only the knife is used in killing it.—A. J. Legg, Nicholas Co., W. Va.

Mention Pennsylvania Farmer in every letter or card you send to our advertisers

WANTED—A PRACTICAL STOCKMAN

We want a practical stockman to sell mixed feed in Pennsylvania direct to consumers for delivery thru local dealers. Must be well posted on feeding of dairy cows, hogs, cattle and horses. Must be a man experienced in selling or in dealing with farmers. We prefer men who have been engaged in buying or selling live stock. Must possess selling ability and must be straight and honest and willing to put in full time driving the country and taking orders from farmers.

We pay all hotel, livery and railroad expenses and pay our men salaries ranging from $900.00 to $1,500.00 per year. We assign from five to ten counties to each of our salesmen and our men have steady work the year around, selling our various kinds of mixed feeds—horse, dairy, hog and cattle feed, which are shipped in carload lots.

No application will be considered unless we are given names of three references; one banker, one merchant, one stockman, also your present occupation, your occupation during the past five years, your age and whether married or single.

Address—M. W. SAVAGE, P. O. Box 414, Minneapolis, Minn.

A Letter from the Postal Life

Four things we all should do:

1. Safeguard the family (if we have one).
2. Keep the youngsters in school (if we have youngsters).
3. Provide for the mortgage on the farm (if there is one).
4. Ensure old-age independence (old age will come).

The *one* best way

Arrange life-insurance in a regular legal-reserve institution: there are many such but there is one that give you sound insurance-protection at low net cost. That institution is the

Postal Life Insurance Company

The POSTAL saves money for its policyholders because it does not employ agents: insurance is arranged direct, by mail or over the counter at the Home Office. The result is that your policy isn't saddled with the heavy expenses of agents and branch offices throughout the country, as in other companies.

Net Cost Low in the POSTAL LIFE because
1st. Commission Dividends ranging on whole-life policies up to
40%
of the premium go to policyholders the first year.
2d. Renewal-Commission Dividends and Office-Expense Savings covered by the
9½%
guaranteed dividends go to Policyholders in subsequent years.
3d. The Usual contingent policy-dividends, based on the Company's earnings, still further reduce the cost each year after the first.

It will pay you

to find out just what the POSTAL LIFE can and will do for you. The Company supplies full personal information to all applicants—men, women and young people—and distance from New York does not hinder. Just write and say: Mail me life-insurance particulars for my age as mentioned in

Pennsylvania Farmer for Feb. 14.

In your letter be sure to give

1. Your Full Name
2. Your Occupation
3. The Exact Date of your Birth

The request for information places you under no obligation and no agent will be sent to visit you. The Postal does not employ agents but gives its policyholders the benefit of agents' commissions—the first year and every other.

How to Get Better Roads.

Earth Roads Improved by Use of King Drag.

By Dr. DONALD McCASKEY.

Township Demonstration Roads

At a recent meeting of the State Board of Agriculture, Governor Tener said in substance: "Now that it has been proven that Pennsylvania does not want a bond issue, if you gentlemen have better plans, let us have them" This seemed to imply that the farmers of Pennsylvania were being charged with the blame for our bad roads. Personally, I felt differently about it. The great trouble is that our state highway officials are trying to solve this road improvement problem at too long a range. They do not seek to become acquainted with the farmer's side. From Mr. Bigelow's persistent indisposition to appear before public organizations thruout the state and to take the public into his confidence, it appears that he has no respect for the ideas and the wishes of the township taxpayers. We all know that the responsibilities of his office are tremendous. But when he fails to come out before public meetings or make accounting of his work to the people for whose road benefit his job was created it is a slap in the face that hurts.

So when Governor Tener requested suggestions, and when Mr. Bigelow did not appear (but sent his man Mr. Jones) and when no constructive and economical method was offered, it occurred to me to present a feasible, workable suggestion which would be as cheap as it is prompt in results. I presented the results obtained in Lancaster county by use of the King road drag patrol system, with the suggestion that it be taken up by the Highway Department, a single mile being dragged in each township as a demonstration for the benefit of the taxpayers of the townships. I remained to hear the report of the Good Roads Committee which had been in conference with the Highway Department. All it contained was a report of "no money" and the statement that the State Board of Charities gets too much money and the State Highway Department gets too little. It was what I would call a "choker" report. There was no action.

But I became interested in the reports of work done by the State Board of Agriculture, so remained. I was amazed at the scope of the work being done. Deputy Secretary Martin showed us that on less than $300,000 he had carried the farmers' institutes to over 2,500,000 individual farmers, scattered all over the state. The whole meeting seemed impregnated with an intense desire to help the township resident; to go out and carry the department's message of help and co-operation to the men and women on the farm. As I listened I wondered why in the world our Highway Department could not go out in a similar way and get better acquainted with the needs of the men and women who must travel our township roadways. The Department has the legal right. The township road law gives it the specific legal power. This law has been hammered and accused of being a steal on the part of our Highway Department. But there are some good provisions in that law. It gives the Deputy Highway Commissioner in charge of the Bureau of Township Highways all the power he could possibly hope or pray for. It certainly gives him the chance to prove that he is worthy of his position. Until our Highway Department does this, "choker" committees can resolute until the crack of doom and we will still have to travel thru the mud.

Paragraph 7 of Section 2 of the township road law, passed at the recent session of the Assembly, reads: "The Deputy or other officer in charge of the Bureau of Towship Highways, under the direction of the State Highway Commissioner shall call such state, county or township road meetings or conventions at such times and at such places as he shall deem wise, and direct officers and employes of his department to attend." This gives our Highway Department all the legal power it needs to inaugurate demonstration work and get down to the actual needs of the users of the rural earth roads. The defeat of the $50,000,000 bond issue ought to be sufficient evidence that our Highway Department can profit in real road improvement by adopting the policy of the Agricultural Department and go out among the townships and hold road-making conventions on the roads where the farmers can see by practical demonstration.

The proposal struck me as being so feasible and so full of promise in actual results that I asked for a vote of those present to indicate how many favored the bureau's patrolling a mile of earth road in each county with a drag. The Chairman very considerately ruled that it was "not proper to take a vote on the matter as there was no motion before the house." The matter was referred to another committee. Whether or not it will bring out another choker report remains to be seen. Please do not get the notion that I am a crank on the road subject. What I am after is to square our words with our actions. There is nothing to be gained by chasing ourselves around the block and putting up the bluff that we are doing all we can in fixing roads when down in our hearts we know that we are not.

THE KING DRAG PATROL ENDORSED

The articles in your paper on road improvement by Dr. Donald McCaskey, remind me of a little poetry I learned in school, the trend of which is as follows:

> "Truth crushed to earth shall rise
> again.
> The eternal years of God are her's,
> But error wounded writhes in pain
> And dies amid its worshipers."

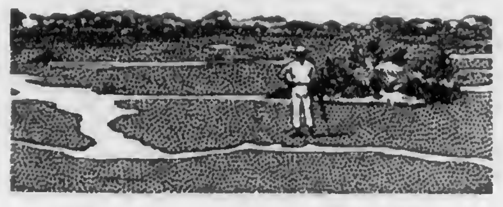
In these articles truth is coming to light again. I am not a politician, nor under obligation to any party or any particular bunch of men, nor a kicker or knocker on paying taxes. I am simply a plain Pennsylvania Dutch farmer looking for returns on taxes paid; and believe me, there never has been a time that a dollar has brought better returns than when Dr. McCaskey was president of our supervisor board. I have been a resident of East Lampeter for 44 years and never before have our roads been as good as they are under our present patrol system with patrolmen Petersheim, Conard, Landis and others on the job.

In my judgment the Doctor has received slight support for his untiring efforts for road improvement. His articles in your paper show that he is conservative as he is really giving facts in a very mild form.—J. Z. Beiler, Lancaster County, Pa.

NEW JERSEY ROAD NOTES

Farmers Fight Wheel Tax.—There is a State-Wide movement on the part of the farmers in New Jersey protesting to the Legislature against the passage of any bill which will impose a wheel tax on vehicles of all kinds. In connection with the discussion over keeping the roads of the State in repair and the large sums of money needed therefor, it has been suggested that all vehicles using the highways, including farm wagons and implements, should be taxed and the money added to the State road repair fund. If such a law were passed, it would require every farmer in the State to pay a vehicle tax of from twenty to fifty dollars a year, in addition to the regular taxes now paid. A prominent farmer said: "Practically every farm wagon that carries any load has wide tires, and is driven so slowly that it is absurd to say that damages an improved road. Macadam roads have always stood wagon traffic all right. It is the high-powered fifty and sixty-mile an hour automobiles that are destroying the State's good roads. The solution of the problem is to make the motorists pay a sufficient tax to keep in repair the roads ruined by them."

Horsemen Want Better Roads.—The Road Horse Association of New Jersey, has, by a unanimous vote, decided upon a campaign for better thorofares thruout the State, and also to co-operate with other organizations seeking relief in this direction. If necessary, the association will appeal to the Legislature to pass a law making the roads and highways safe for horse-drawn vehicles. This action applies not only to forbidding extra large auto-busses and motor trucks to use the public highways, but also, it applies to materials used in building roads and the oil spread on the surface to settle the dust. It is claimed that in many instances the roads have become so slippery as to make them very unsafe and dangerous for horses to travel.



Why not invest in permanent roofing?

Avoid needless expense for roofing that demands frequent repairs.

Get Genasco, made of "Nature's everlasting waterproofer"—Trinidad Lake asphalt.

Genasco
THE TRINIDAD-LAKE-ASPHALT
Ready Roofing

is a sure and lasting protection against sun, rain, snow, wind, heat, and cold; it is attractive and economical as well.

Write us for samples and the Good Roof Guide Book. Ask your dealer for Genasco. THE KANT-LEAK KLEET makes seams water-tight without cement and prevents nail-leaks.

The Barber Asphalt Paving Company
Largest producers in the world of asphalt and ready roofing.

San Francisco

A FARMER'S GARDEN

Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS

will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $2.50 to $12. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

No. 6 Drill and Wheel Hoe

BATEMAN M'F'G CO.
Box 2432
Grenloch, N. J.

ECONOMY

In first cost, upkeep and operating expense, for all kinds of farm work where horse-power is required is secured with

FLINCHBAUGH FARM TRACTORS
2 to 25 HORSE POWER 9 SIZES

Adapted to all classes of work, gasoline or kerosene fuel. Ten years successful use.
Stationary Gas Engines, 1 1-2 to 50 H. P.
Portable Gas Engines, 1 1-2 to 24 H. P.

Demonstration Roads

The proposition of having a demonstration road in each township of the state, made in the article on page 9 of this issue is worthy of serious consideration. Because of variations in soil, topography and to a more limited extent in climatic conditions, the building of earth roads must vary with local conditions. In Lancaster County the King drag has done wonders in building as well as maintenance of roads. In Bedford County a system of building with the King drag for maintenance has been giving excellent results. In Crawford County greater attention to drainage was essential and a stone covering has been used cheaply and economically. Scarcely two counties of the state can handle their roads in exactly the same way. The township demonstration roads would not only develop the best methods for local conditions but would promote local interest and enthusiasm for good roads which would go far in the support of a permanant plan. We recently heard an official of the State Highway Department say that the farmers have failed as road makers; that under the old system of township work without state supervision the work was wasted and tax payers objected to the small amount of road money raised. He is right that taxpayers object to raising money to be wasted whether in actual road work or in expensive maintenance of a so-called system. Show the taxpayers actual results in road building, and a dollar's worth of work and road improvement for every dollar invested, and there will be no objection to road taxes. Show each township how to build its earth roads most economically and most efficiently, and there will be no lack of road interest. The demonstration road will do both. The State Highway Department has the legal power to take it up. The rural tax payers should press the demand for it. It is the logical starting point not only for township road improvement, but for the development of definite knowledge of how to handle the earth road problem under the varying conditions of the state.

Expert Advice

An outgrowth of the present wave of state and national interest in agricultural affairs is the organization of various agencies for giving expert advice to farmers. Some farmers feel inclined to resent all of it; others take it as merited service in their work too long deferred. It may be well for all farmers to keep fully informed on the source of proffered advice and judge motives carefully. The extension of established agricultural institutions, like the federal and state departments of agriculture, the agricultural colleges and experiment stations, to carry the results of their experimental and research work directly to the farmers is in direct line with modern teaching methods. These institutions are merely seeking to bring to all farmers the results of their work which were previously available to or made use of by a few. They are merely extending their fields of usefulness, and when their methods have been demonstrated and farmers have had the opportunity to see the practical value of their work, they should enjoy the fullest confidence of the farmers. But with this general movement for giving personal service to farm problems there has sprung up another class of so-called "experts" representing commercial interests and business organizations who sell their products to farmers. Educational bureaus, farm bureaus and service departments are being established by large commercial organizations, each with a farm expert in charge, to give expert advice to farmers along their particular line of farm interest. Some of these commercial bureaus are drawing men with national reputations and some are doing valuable work along general development lines. Farmers may get really valuable service from such agencies, but they should keep in mind the exact status of the expert and his personal interest in the nature of his advice. The state experiment station and the agricultural college is usually prepared to render service on the same subject and should be made use of in preference to any other agency which may be financially interested. In these days there are experts and experts.

Soy Beans

We have had an interesting exchange of experiences of readers in recent articles on the growing of soy beans. There can be little doubt that the crop has many features of value which should encourage its greater use in the East. Its feed and fertilizing value is but little below that of alfalfa. Farmers' Bulletin 22 credits alfalfa hay with 14.3 percent protein, 25 percent fiber, 42.7 percent nitrogen-free extract and 2.2 percent fat. It credits soy bean hay with 15.4 percent protein, 22.3 percent fiber, 38.6 percent nitrogen-free extract and 5.2 percent fat. Soy bean seed is given as containing 36.3 percent protein, (cottonseed meal contains about 40 percent) 3.9 percent fiber, 27.7 percent nitrogen-free extract and 18 percent fat. These figures show soy bean hay to be even slightly superior to alfalfa hay in protein content, and yet alfalfa has been boomed to such an extent in recent years that it has come to be regarded as mild sacriledge to utter a hint against its general adoption in all locations and on all soils. It is scarcely impossible to say too much in favor of alfalfa where it can be grown economically. Its heavy yield under favorable conditions, its value as a stock feed, its beneficial effect upon soil fertility because of its ability to store up nitrogen in the soil and penetrate deeply in rooting, all combine to make it one of the most profitable if not the very best forage crop to be grown. But it is impossible to make one crop fit all conditions, and there are sections in which a crop of alfalfa costs, in time and labor of securing a stand, about all it is worth. A contributor reported recently that his alfalfa had not been a failure, but that if he had charged it with all of the labor and loss of other crops while putting his soil in condition for alfalfa, his yield would cost him nearly as much as purchased mill feeds, ton for ton of food value. His is no doubt an exceptional case, but there are many farmers who have spent much time and energy in trying to make conditions right for the growing of alfalfa when they might have secured as large yields of the slightly less valuable soy beans with much less labor and expense. We have no desire to discourage efforts to grow alfalfa. It is succeeding in new sections every year and better knowledge of its exact requirements may make it possible to grow it economically in every section of the country. But farmers should not neglect the soy bean, which is almost of equal value, while experimenting with alfalfa.

Homelike Homes

Our copy books, in the good old days when penmanship was taught by copy, told us that the three most beautiful words in the English language are Mother, Home and Heaven. Most of us who have long since forgotten the monotony of copying this sentence have learned to appreciate its truth. Some of us may even be willing to go further and assert that Mother and Home have the making of Heaven. To those of us who have reached the stage of parenthood, the responsibility of that making and the influence of the Home thru our guidance is a matter of very deep concern. We may make pains-taking study of questions of domestic science, of housekeeping, house furnishing, feeding and sanitation, but home-making is a matter of the heart and not the head or hands. In these days of scientific guidance in everything that partains to our domestic and business life we are in danger of permitting scientific and hygienic housekeeping to interfere with real home-making. Our attention has been called to the case of a lady who was criticised for permitting her husband and children to "litter up" every room in her house, and defeat her best efforts at tidy house-keeping. Her reply was so full of the true mother sense and so sound in domestic philosophy that we want to pass it on to others. She said: "The marks of the little muddy feet upon the floor can be more easily removed than the stains where the little feet go into the highway of sin. The prints of little fingers upon the window pane cannot shut out the sunshine half so much as the shadow that darkens the heart over one who is but a name in the coming years. If my Joe finds home a refuge from care and his greatest happiness within its four walls, he can put his boots in the rocking chair and hang his coat on the floor any day in the week. And if I stand it and he enjoys it, I cannot see that it is anybody's business." Because of the old home which was and still is a refuge from care, because of the complete happiness which we enjoyed within its walls and because of the mother who "stood it" and who never wearied of work if it kept her boys contented in the wholesome, tho oftimes noisy, atmosphere of the old home, this plain statement of home philosophy appeals to us. The glow in that mother's eyes, as she sees her boys gather at the old home at every opportunity shows that her sense of permanent possession is ample payment for the littered rooms of the past.

From Farmer to Consumer

The Department of Labor has just issued figures showing comparative prices of wheat and flour for a period of years which are of interest in connection with the cost of food manufacture. Inasmuch as bread is the staple article of diet on the poor man's as well as the rich man's table, figures on the cost of flour may be taken as a reliable guide to the cost of handling actual necessities. In this case the figures do not deal with increases of cost except in an indirect way, but show more particularly the excess of price of flour over price of wheat. The average price per bushel of wheat of all grades paid farmers at 10 elevators in March and October of the three years of 1906, 1910 and 1911, was found to range from 56.1 to 97.8 cents, with a general average for those years of 79.4 cents. The average retail price of patent flour made from one bushel of wheat in the same months of the same years ranged from 76.9 cents to $1.04, with a general average of 95.9 cents. The excess in price of flour over the price of wheat varied from 6 to 20.8 cents, and averaged 16.5 cents. Thus the average excess in price of patent flour over the price of wheat represented an increase of about 20.7 percent. But patent flour is but one product obtained from the wheat. The wholesale price of products of one bushel of wheat other than patent flour averaged 28.8 cents for periods, and the average excess in total of prices of all products of one bushel over the price of a bushel of wheat averaged 45.3 cents. Thus the manufacture, transportation and sale of the products of wheat cost an excess of 57 percent over the cost of wheat. In other words, on the average of a period of five years, $1.00-wheat means $1.20-flour and $1.57-manufactured products per bushel of grain; or that the manufacture and distribution of flour costs practically one-half the production cost of wheat. This manufacturing and selling cost covers the handling by grain elevator, the railroad, the grain jobber or commission man, the flour mill, the flour jobber or wholesale grocer and the retail grocer. The investigation shows that as a rule the margins on manufactured products were lowest when wheat was highest. Every rise in the price of wheat was accompanied by a lower margin on flour and every fall in price by a higher margin, with a single exception during the five years.

STATE CAPITAL NEWS

Soil Study.—Pennsylvania is about to issue for the first time a comprehensive study of the soils of the various counties of the State, the results of a systematic investigation that has been carried on by the Department of Agriculture for the last few years. It is hoped to have the books ready for distribution some time this summer. This study of the soils of the State is the first of the kind ever made on a general plan. There have been geological surveys and studies of soils in various localities, but this work is entirely original and is expected to furnish valuable information about large areas of the State which are little known; and some believe that it will open a way to utilize some of the farms or deforested districts in northern counties which can be made to yield with a little care. The publication will probably comprise two volumes and the information to be given should be of value to people interested in the restoration of agriculture in many districts of the State.

New Agricultural Program.—The executive committee of the State Conservation Association at its meeting here a few days ago outlined a program for legislation for agricultural advancement which is not only decidedly progressive but, when one studies it, based on common sense. The plan is to draft bills embodying the ideas and have legislative candidates express their views. The only criticism that might be found is that nothing is said about readjustment of the state's appropriations, the equalization of taxation, or highway improvement. Probably the latter subject was left open because of the effort being made to work out a program on which everyone can agree. But why the other topics were not touched is not stated. The suggestions for centralization of agricultural advancement work, improvement of rural school conditions, conveyance of pupils at public expense when living a certain distance from their homes, co-operation in business pertaining to agriculture, use of schools for social centres and extension of demonstration work, and the increase of state police for rural patrol work are excellent and tho bills providing for them, if drafted on a practical basis, will doubtless receive much attention in the legislature. Of course, the program will require increased aid for rural school districts to enable these objects to be carried out, and this will commit the state to an increased appropriation.

Party Platforms.—As state conventions are unknown in Pennsylvania the meetings of the State committees will take the place of such gatherings and the resolutions adopted by them will stand as a declaration of principles. It will be quite interesting to watch how the resolutions will deal with the important issues. High sounding declarations about the return of rule to the people will doubtless abound, but the dwellers in the countryside will be more interested in what is to be said about apportionment of the state income. This is a subject which, in view of the recognition that agriculture must be aided and the education of the children furthered, supersedes demands that this or that man or set of men be eliminated from power. It will matter not that the state has a new set of rulers if there be no change in the way of apportioning the income.

Going To The Source.—It is probable that among the bills to go before the next legislature will be one to go to the root of the fertilizer business. Every meeting of an agricultural body here has brought complaints that fertilizers are sold which are open to suspicion and that the constituents are not what was expected. The system of examination now in vogue dates back a considerable period and there is a demand that the state agents be given authority to inspect plants and methods and that the mere purchase of samples and analysis should not be the end of the inspection work. Undoubtedly, there is some humbug in fertilizers or there would not be so many complaints, and the passage of a law enlarging the powers of the state agents would afford a means of protection and at the same time offer a safeguard to the manufacturer who has nothing to fear from the most rigid inspection. The operation of the cattle feed inspection law has driven from the state a good many compounds which were causes of complaint in years gone by and the amount of spurious or misbranded fertilizer sold has decreased very much, but apparently more power is needed.

Sealers and Dealers.—According to reports at the Capitol practically every county and city has now established inspection of weights and measures and the regulation of the means by which consumers receive their produce will attract much attention the remainder of the year. As to the justice of the "commodities" act, which has been criticised at a couple of meetings, time should show whether there has been any injustice done. The claim of the officials here is that the act is similar to the statutes in other states and that it is in accord with the square deal principle. People engaged in the fruit business reply that it is upsetting things generally and that there is little basis for the arguments in behalf of it. The sealers will have an opportunity to demonstrate what are the conditions and if the consumer has been getting the worst of it there will be small chance of getting by any amendment at next session of the legislature.

Forcing Out The Butter.—Millions of pounds of butter bought up from the creameries and farmers last spring which has since reposed in cold storage warehouses must come out of the storage places within the next forty days, say officials. Here and in Philadelphia alone two and a third million pounds are due to appear or be declared unsalable in Pennsylvania. Hence the outlook for a slump in butter prices, especially with the large consignments from Australia and Europe coming in under the new tariff, is rather strong ,altho the average farmer and creamery man is not worrying about it.

Agricultural Teachers Wanted.—According to State educational officials there is a big demand for teachers with a knowledge of agriculture from school districts where the addition of agricultural teaching to the course is contemplated next year. The normal schools have been asked for names of those who have given study to this subject and it is said that places for them will be waiting when the school bells ring in the fall. The extension of agricultural teaching has been rather slow in getting started, but according to those who supervise the schools it is because people are feeling their way and endeavoring to obtain practical courses which will give the boys and girls knowledge which

they can apply to advantage as soon as they leave school. The State Library is taking steps to provide for its traveling library service such books as will supplement what is taught in schools.

Passes and Free Service.—The Public Service commission has at last decided that employes of railroads can get passes for members of their families but the other questions which have arisen because of the operation of the act of 1913 have not yet been determined. Outside of churches, ministers, hospitals and charities not many people are concerned and a needless amount of time seems to have been consumed in reaching a decision. The biggest subject before the commission just now is water rates, which are apparently without much system in the State some very odd things having been turned up in complaints. The question of whether passes can be given in return for rights of way also hangs fire, altho if free transportation figures in the employment of men it is difficult to see why it can not be recognized when a part of a formal contract for a line thru one's land.

Road Drags.—According to officials of the State Highway Department the state owns almost 1500 road drags and they are located all over the state, having been used last fall in highway maintenance until the work ended because funds ran low. If, as contended there will be little money for road maintenance this year, these drags could be loaned to townships and put to work on the roads instead of being allowed to remain idle or to get lost. And the road superintendents, who will not have many men because of the shortage of funds, could put in their time instructing the supervisors and neighbors in securing the maximum use out of the drags when the spring repair time comes around.—Hamilton, Harrisburg, February, 9.

NEW JERSEY FARM NEWS

Potato Prices Increase.—Since the annual meeting a few weeks ago of the Monmouth County Farmers' Exchange, additional statistics of interest have been gathered by W. H. Ingling, the general manager. These new statistics show that farmers of the county who hold membership in the organization have profited to the extent of an increase of 50 cents a barrel for potatoes under exchange methods, or a total increase in revenue of $1,007,328 for the six exchange years over the previous six years. His figures also show that, thru a material reduction in price on standard fertilizers, brought about by the exchange, the farmers have saved $57,776 on their fertilizer bills.

South Jersey Exchange Prosperous.—A profit of 52 percent. on a capital of $28,410 is shown by the South Jersey Farmers' Exchange for its fifth year. More than $700,000 worth of business was transacted during the fiscal year, thru its 16 stations in Salem, Cumberland, Gloucester and Camden counties. However, no dividend was declared by the directors, in spite of the heavy profits, because it was desired to use the earnings in extending the business of the exchange. The surplus is now within a few hundred dollars of the total capitalization, or more than $28,000, and capital stock which sold at $5 a share now has a book value of nearly $10. There are more than 600 members in the exchange. Last year the exchange sold 722 carloads of potatoes for the farmers at an average price of 73 cents a bushel for prime stock and 26 cents a bushel for second size. Other farm produce was also handled. More farm supplies were sold thru the exchange last year than ever before, at a saving of several thousand dollars to members.

Cranberry News.—Prices for cranberries are higher now than growers and shippers have ever experienced. The growers say that commission men received most of the extra profits this year and they are now trying to find a way to benefit themselves when the prices are high. They point out that the actual jump in the price of cranberries has been made conspicuous by the fact that the market ratio of 3 to 1, of long standing between apple and cranberry quotations, has changed to a new ratio of 2 to 1. A special committee has been appointed by the cranberry growers to appear before the Legislature and ask for a new bill fixing a standard-sized cranberry barrel to conform to a new government standard which goes into effect July, 1915. Many barrels now used by Jersey shippers are said to violate the State law of weights and measures. It is said, however, growers will be permitted to use their present stock of barrels before the law is strictly enforced.

To Relieve Farmers From Trust Laws.—Relief for labor organizations and farmers from the restraints placed upon corporations by the new State corporation laws prohibiting combinations for the increasing of wages or the prices of commodities, is sought in a bill fathered by Assemblyman W. M. Wheatley, Democrat, of Salem county. The bill provides that it shall be "lawful for persons employed or seeking employment to enter into any arrangements on combinations with the view of lessening the hours of labor or of increasing their wages or bettering their conditions, and any arrangements, agreements or combinations among persons engaged in agriculture or horticulture, when made with the view of enhancing the prices of agricultural or horticultural products shall be lawful." It places restrictions on the granting of injunctions in any cases between laborers and employers, or between laborers themselves, growing out of a dispute concerning terms and conditions of employment, or in case of any combination of persons engaged in agriculture or horticulture to regulate the prices of their products. It further provides that under conditions such as stated, neither employes nor persons engaged in agriculture or horticulture shall be liable to indictment or prosecution for conspiracy in the courts of the State. This bill will afford, if enacted into law, the fullest protection to farmers' exchanges and dairy associations, and permit them to have something to say about fixing the prices of farm products, butter and milk.

Grade Crossings.—Senator Edge, of Atlantic County, has introduced a bill known as Senate Bill, No. 29 which if it becomes a law will compel the railroads to provide every grade crossing in the State with some safeguard for the public. Senator Edge in explaining the bill said it was introduced for the purpose of securing for the public some relief pending the elimination of grade crossings under the Fielder act, which elimination, it is agreed, will require at least thirty years. He pointed out that according to a report of the Public Utilities Commission there are 3,150 grade crossings in the State, 1,900 of which are unprotected.

The Fire Line Law.—Members of the State forest commission and of the various railroads operating in the State, have been conferring in reference to securing the passage of a new fire line law to take the place of that of 1909 which was dclared unconstitutional by the Court of Errors and Appeals last year. It is proposed to seek a practical re-enactment of the fire line law with such amendments as may be deemed necessary by the Attorney General's office to meet the court's objection that the law sought to compel the taking of private property without due process of law. The railroads expressed a desire that the new measure should rest in the commission authority to exercise discretion as to its enforcement, arguing that there is no justification for imposing the same conditions on railroads running thru rock or sparsely wooded territory as upon those running thru thick woodlands; and with this in view it is probable that when introduced the bill will contain discretionary features.

Convict Labor Successful.—The experiment of employing convict labor in clearing up the State farm of more than 1,000 acres along the Maurice river is proving a much greater success than even the most sanguine expected. When this land is once cleared and put into shape for growing crops, the State experiment station at New Brunswick will take hold. Not only will an attempt be made to make the farm self-supporting but it will be conducted as an experimental farm by the station authorities. This farm lies in the midst of the section known as the "pine-barrens." It is gratifying to know that an effort is now to be made to demonstrate the productive value of lands which have not been heretofore developed except thru private initiative.

Cranberry Growers Indignant.—The cranberry growers of this state have been rankled by the comparison of their picking system to that of the use of child labor in the factories and other city industries. Prof. John H. Voorhees, of the New Brunswick experiment station, who has done considerable work in the bogs during the past few years, declares that the child labor conditions have been exaggerated. He spent three weeks on a number of different cranberry bogs during the harvesting season to obtain data regarding some fertilizing experiments, and during that time had ample opportunity to observe the actual conditions as they exist. The children, little ones and big ones, boys and girls, go to the bogs with their parents when the whistle blows. They spend most of their time playing and when they get tired of play they run to the line of pickers and fall in with their parents and pick a few berries, then run off and play again. It requires about 5,000 pickers every year to gather the berries, and magazine writers have been claiming that about one-third of these were children, more than half of whom are under ten years of age. No one denies that these children are on the bogs at picking time, but the truth is they accompany their parents, not for work, but because it is deemed unwise to leave them alone at home.

State Beekeepers' Convention.—The recent convention of the beekeepers in this State was held at New Brunswick. Secretary Carr reported that New Jersey did not furnish sufficient honey to meet the demand and that considerable Colorado honey was sold in the state. It was also shown that of the 2,000 beekeepers in the state, the average number of colonies was seven to each. The yield of honey, it was declared, was not half what it should be under the normal conditions The state has encouraged this industry with an annual appropriation of $2,000, placed at the disposal of Dr. Thomas J. Headlee, the State entomologist. Two plans, one to concentrate efforts against bee diseases in one section of the State and from the results carry on an educational campaign in the rest of the State, the other to examine every colony in the State periodically, (this plan to cost three times as much as the $2,000 allowed by the State for this work) were discussed. Many other problems were discussed by different speakers. C. H. Root, of Red Bank, was elected president for another year.

State May Secure Windfall.—When the House Committee on Roads finishes its conferences with the United States Office of Public Roads, it is possible that New Jersey may receive the sum of approximately $430,000. There may be a total of $25,000,000 available for roads in the States, of which our share will be the sum mentioned. The passage of the bill for this appropriation seems fairly well assured.

Grange Notes.—All the granges in Hunterdon county were represented at the county Pomona which was held at Flemington. District Deputy Fisher installed the following officers for the ensuing term of two years: Master, William Rittenhouse, Sergeantsville; overseer, Frank Bird, Stanton; lecturer, Spencer L. Dilts, Three Bridges; secretary, Edward Nief, Flemington; treasurer, Manning Sherman, Locktown. Vernon Valley Grange has installed officers as follows: Master, Charles L. Giveans; overseer, Thomas W. Mann; lecturer, Rev. H. C. Conger; secretary, Mrs. Emma P. Giveans; treasurer, Thomas W. DeKay. The members of Livingston Grange have adopted a good plan for the winter. At each meeting they discuss some phase of fruit growing or market gardening.

Public Schools And The Grange.—The differences which have been causing friction between the State board of education and the State grange have been adjusted, as the result of the recent conference between the former and a committee representing the latter. Concerning the tenure of office act, local boards of education will be given greater power in determining whether a teacher should be retained or dismissed. Particular objection was also made to the present pensioning laws. It was pointed out that in some instances a teacher, when pensioned, received more salary than when actually employed. This is brought about by the fact that many teachers receive sixty percent of their salary from the retirement fund and fifty percent more from the community. It was the view of some of the members of the committee that a teacher fifty-five years old is of greater service to a community than one younger. As to the construction of sanitary schoolhouses and the transportation of pupils, the laws will probably remain as they are.

Fish and Game Bills.—A number of fish and game bills have been introduced. One provides that no license to hunt with firearms shall be issued to any person under 16 years of age. Another makes it illegal for any unnaturalized foreign born person to hunt for, or capture or kill any wild bird or animal, either game or otherwise, except in defense of personal property. It also makes it unlawful for any such person either to own or be possessed of any shot gun or rifle. This measure is inspired by the many shooting affrays in which foreign born residents have been engaged in North Jersey.—D. T. Hendrickson.

NEW YORK LETTER

Eastern New York Fruit Growers.—The annual meeting of the eastern New York Fruit Growers will be held at Poughkeepsie on February 19 and 20. Besides several state speakers there will be speakers from other states, among them Orlando Harrison, of Berlin, Md., and Senator S. L. Lupton, of Virginia. A strong program is provided. There will be an exhibit of spraying machinery and horticultural appartus. The state experiment station will exhibit apples and the state agricultural college will have an educational exhibit.

Pheasants Starving.—The pheasant is appreciated in Tompkins County and the game warden is his protector. During the past few weeks the snow has been so heavy or so hard that the birds could not get sufficient food for their needs, so the farmers were asked to scatter cheap grain on the snow and about the fields for the pheasants. The county fish and game club has also been actively interested in protecting the birds.

Agricultural Bills.—Among the bills recently introduced in the legislature of special interest to farmers is one by Senator Godfrey requiring the state to pay interest on the moneys due farmers whose cattle have been killed by the state. The farmers have waited long and patiently for this reimbursement and Senator Godfrey believes that they should have interest on the money owed them by the state. Another bill provides for the physical examination of cattle not only for tuberculosis but for other diseases and makes it compulsory. Heretofore it has been largely optional with the farmer. Also a bill has been started on its way thru the legislature for a bi-partisan highway commission to handle our highway affairs. Another measure provides that stock in transit shall not be kept on board cars longer that 24 hours without 10 hours off for rest and feeding. The present time limit is 36 hours. A market commission is called for in another bill which will soon be introduced and which it is said the governor favors. There will no dearth of farm legislation this year, or rather of proposed legislation, for probably not all will get thru.

Barge Canal Aftermath.—The barge canal is nearing completion but not so the settlement of the claims against the state growing out of the construction of the great waterway. These have accumulated until the attorney-general finds it necessary to recommend that a special tribunal modeled on the board of claims be created to dispose of the many claims that have arisen where differences of values of lands taken by the state is the issue. The total claims now amount to the large sum of $64,000,000. Last year the board of claims disposed of 482 cases and about 1133 are still pending.—D.

MARYLAND NOTES

Cannery Contracts.—Queen Ann County Canners are already making arrangements or contracts with farmers for next season's production of peas and tomatoes. Indications point to an increased acreage in all canning products the coming season. The canneries are now looked upon as a real blessing to the farmers. Many who had not previously realized much from regular rotation crops find raising canning products profitable.

A Co-operative Association. — Harford County has recently organized The Farmer's Co-operative Buying Association of Baltimore and Harford Counties, with the main office at Baldwin. Arrangements have been completed to supply seed potatoes, clover seed and fertilizers. Last year the farmers in the vicinity of Randallstown, Baltimore County, combined and purchased several car loads of fertilizer, getting it at 100-ton rates, which was a saving of several dollars a ton.

Breeders' Association.—A Jersey Cattle Breeders' Association has been formed in Harford County, with Judge William H. Harlan as president and treasurer and C. E. Lloyd, secretary. There are many extensive dairy farms in the County and fine herds of pure-bred Jerseys are becoming conspicuous.

Road Problems. —There is general complaint in all good road sections, that the roads have been made too smooth; that the automobile considerations have been the main thing. During the recent wet spell hundreds of horses fell on the good roads, on way to market, and a number of Harford County farmers after coming city-ward several miles, became disgusted, turned around and returned home. Farmers declare that on Sunday they are afraid to go on the road with teams to church on account of the rate of which automobiles go and the indifference they show other vehicles. There is a bill before the state legislature to limit the speed to 25 miles an hour, but that will have no effect in the country, where speed laws and all other laws seem to be ignored by automobile owners.—G. O. Brown.

KNITTED DUTCH COLLAR

(Key to abbreviations used in the following directions: Sl. slip stitch; k, knit.)

Cast on 35 stitches.

1st Row.—Sl 1, k 16, narrow, over twice; narrow, k 6; (narrow, over) twice; k 1, over, narrow, k 1.

2nd Row.—K 16, seam 1, k 14, turn, leaving 4 stitches on the left-hand needle.

3rd Row.—Sl 1, k 21, (narrow, over) twice; k 3, over, k 2.

4th Row.—K across, including the 4 "left-over" stitches.

5th Row.—Sl 1, k 24, (narrow; over) twice, k 5, over, k 2.

6th Row.—Knit across.

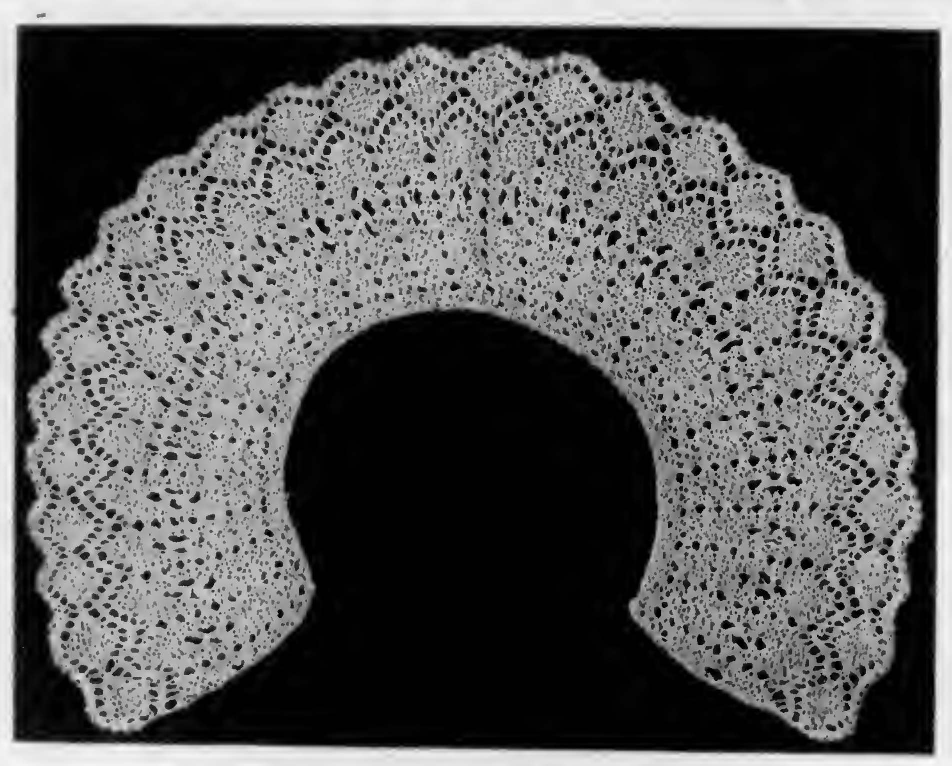
7th Row.—Sl 1, k 2, (over, narrow) 10 times; over, k 3 together; over, narrow, over; k 7, over, k 2.

8th Row.—Knit all but two stitches, turn.

9th Row.—Sl 1, k 22, (over, narrow) twice; k 5, narrow, over, k 2.

10th Row.—Knit all but 4, turn.

11th Row.—Sl 1, k 21, (over, narrow) twice; narrow, k 3, narrow, over, narrow, k 1.



A COMFORTABLE KNITTED DUTCH COLLAR.

12th Row.—Knit all but 6 stitches, turn.

13th Row.—Sl 1, k 10, narrow, over twice narrow, k 6 (over, narrow) twice; k 1, narrow, over, narrow, k 1.

14th Row.—K 17, seam 1, k 10, turn.

15th Row.—Sl 1, k 6, (narrow, over, twice, narrow) twice; k 5, over, narrow, over, k 3 together; over, narrow, k1.

16th Row.—K 14, seam 1, k 3, seam 1, k 16.

Repeat from the first.—Elma I. Locke.

THAT LITTLE DOWN-STAIRS BEDROOM

So many of the old-time farm-houses have a little down-stairs bedroom, just big enough to tempt one to use it, and not big enough to hold the necessary conveniences. A closet off this little room is an almost unheard-of luxury. There is no room for a chiffonier. There is no place to hang a garment except upon the much overburdened back of the door. Yet one is tempted to use the room because it is so handy in other respects, such a saver of climbing up and down stairs.

Sometimes space may be gained by removing the door and using a substantial curtain in its place; this makes the room warmer during cold weather if it opens into a living-room, but space and warmth are purchased at the price of seclusion from noise and interruptions.

Nothing helps out this small bedroom problem more than a good, strong screen; one of home manufacture will be quite satisfactory. If the frame must be rough and crude, bring the panel covering over the edges so as to completely cover the framework. Burlap makes a substantial and inexpensive covering.

When the screen is completed, fasten the back of each panel one or more cleats holding wardrobe hooks. Below these several strong pockets may be suspended for the storing of slippers and an extra pair of shoes. The hooks will hold all one's everyday clothes. Such a screen protects the bed from draughts at night when the window is wide open, as it should be.

Such a serviceable screen can often be made at home at practically no extra expense; it makes that tiny downstairs bed-room comfortably livable, and saves the housewife many steps.—Alice Margaret Ashton, Jefferson Co., N. Y.

SOME SOUTHERN COOKERY

Here are our methods of cooking some things relished by our family. I notice that some families, whose main diet consists of sweets, meats and more sweets, are often calling in the doctor. In our family, except when the babes were little, we have not had a doctor but twice, and then for accidents, and we have seven children and one grandchild. Is not that a pretty good recommendation for corn bread, beans, mush, milk, eggs, butter and fruit?

Opossum and Sweet Potatoes.—For best results procure the opossum alive. It should be plump and not bitten by dogs. Scald and scrape it, and remove entrails. Boil for one to three hours, according to size, in slightly salted water. When a fork will go thru the meat readily, remove it from the kettle, and have ready a mixture of pepper, sage and ginger; sprinkle this over the meat, and lay it in a roasting pan, with medium-sized sweet potatoes around it. Bake until thoroly brown, turning until all parts are crisp. Serve hot with corn bread and thick buttermilk or coffee, and you will agree that 'possum makes good eating.

Southern Corn Bread.—Break 1 egg into 3 pints of sour milk, add 1 scant teaspoonful soda, 1 level teaspoonful of salt and corn meal to make a thick batter. Beat briskly for several minutes, then pour into a hot, well-greased pan, and bake for one hour in a moderately hot oven.

Lye Hominy.—Place ¼ bushel of good wood ashes in an old tub, cover with boiling water, let stand a day or two, then strain off a gallon of the lye and pour it over 1 gallon of shelled corn. Boil until the outer hulls will slip off. Drain off the lye, wash the corn thru several waters, put into a kettle, adding a handful of salt; cover with water, and boil until the corn is soft adding more water as the water evaporates, and stirring to prevent scorching. (If you will cook the corn in a fireless cooker, you will not be bothered with watching to see that it does not boil dry or does not scorch, and the corn will be just as good.—Editor.) When done pack into crocks, and it will keep for several weeks in a low temperature. Fry it in meat drippings or serve in a cream sauce. This is preferred by many Southern appetites to ground hominy or samp.

Beans and Noodles.—Wash and parboil for one hour 1 quart of red kidney beans; drain dry, add 3 quarts boiling water, 1 level tablespoonful of salt and ½ pound fat pork. Boil until the beans become soft, then remove the meat and add more boiling water unless the beans are well covered.—(To Make The Noodles). Sift 1 pint of flour into a mixing bowl, add a pinch of salt, pour on boiling water to make a thick batter, drop into the beans by spoonfuls, and boil briskly for 5 minutes, then add ½ pint of sweet cream, and let boil up. Serve hot. Noodles made with boiling water are always light and fluffy. A bit of butter may be added if liked, but it should be well worked into the flour before pouring in the water.—Mrs. Dora B. Phillips, Washington Co., Tenn.

CLEANING SILVER

One of the best and cheapest "labor savers" I ever made is my silver-cleaning pan. I bought an agate dish-pan, 18 inches in diameter, and a piece of zinc to fit in the bottom. When my silver looks dark, I put it on the zinc, on the bottom of the pan and cover it with cold water, adding a big spoonful of salt or baking soda. I can then leave it for a couple of hours and do some other work. At the end of that time I prepare a pan of hot water, to which I transfer the silver, a piece at a time, being careful not to let it dry at all. I take it out, one at a time, and wipe it dry on a piece of soft cloth and the silver shines beautifully.

There is nothing in it to hurt the silver in any way. The chemical action of the salt on the zinc works only on the oxide on the silver, and there is no hard work in rubbing. If you are in a hurry, put the pan on the stove, and when it boils it is ready to put in the clean water and wipe dry.—Evelyn Harris, Md.

WAFFLED POTATOES

Waffled potatoes make a pleasant change in the diet and are easily prepared. Wash and pare the potatoes, slice, with a vegetable slicer which comes for this purpose, and let stand in a bowl of cold water for two hours. Drain, and dry between towels. Fry in smoking hot fat, drain on white paper, and sprinkle with salt. Serve hot.

Conveyance Of Real Estate To Children.—A husband and wife have several married children and one who is single. Can they deed a part of their real estate to the unmarried child for a small consideration?—Bradford County Reader.—Yes. The entire real estate could be given to the unmarried child. A child, married or unmarried, has no interest in real estate owned by its parents which will prevent a conveyance to another child.—G. G. and H.

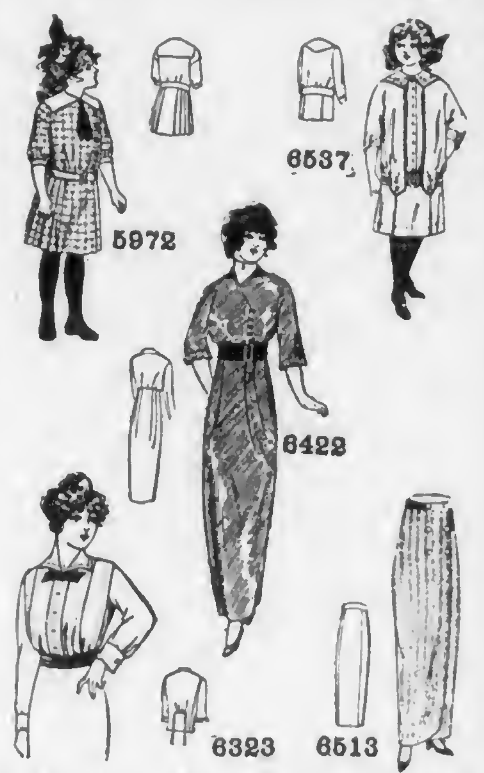
PENNSYLVANIA FARMER PATTERNS.

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.

5972—Girls' Dress.—Cut in sizes 6 to 12 years. Size 8 years requires 3½ yards of 36-inch material. Price of pattern, 10 cents.

6422—Misses' and Small Women's Dress.—Cut in sizes 14 to 18 years. Size 16 requires 3⅞ yards of 36-inch material. Price 10 cents.

6537—Girls' Dress.—Cut in sizes 6 to 14 years. Size 8 requires 2½ yards of 36-inch material. Price 10 cents.



6323—Ladies' Tucked Shirt Waist.—Cut in sizes 34 to 42 inches, bust measure. Size 38 requires 3 yards of 36-inch material. Price 10 cents.

6513—Ladies' Five Gored Skirt.—Cut in sizes 22 to 32 inches, waist measure. Size 24 requires 4 yards of 36-inch material. Price 10 cents.

The Dairy

COW FEEDING AND TESTING

Dairying was featured at the recent meetings of the Mercer County, N. J., Farm Bureau. At these meetings the chief speaker was A. S. Cook, Professor of Dairy Husbandry at the State Agricultural College, and in charge of all the farm operations there. Prof. Cook in his addresses first took up the subject along feeding lines. He said that a desirable dairy ration must first be balanced, that is, must have the proper quantities of digestible protein, carbohydrates and fat. These quantities had been determined by long study at the experiment stations, and should stand in the proportion of one pound of protein to from five to seven pounds of carbohydrates and fat. He called attention to the fact that the analysis on the outside of grain bags represented the total chemical analysis of the feed rather than the amount that was digestible. The protein in straight grains such as corn, oats and wheat, and the protein in straight mill by-products such as brewers' and distillers' grains have a high digestibility; while the protein in oat hulls and mill sweepings have a comparatively low digestibility. The more crude fiber found in a feed the less digestible it is.

In the second place, a good dairy ration must be succulent, that is, have that quality which is possessed by June pasture. This is furnished best and cheapest in the winter time by corn silage. At the Experiment Station affected a saving of 17 percent. Cottonseed meal, corn, distillers' grains and buckwheat middlings represent the cheapest source of protein, while in the second class come malt sprouts, dry brewers' grains and gluten. A little bran is usually added to the ration because of its stimulating quality on digestion, even tho bran is a high-priced feed, figuring simply on the nutrients it contains.

As a sample ration to be fed with 10 pounds of corn stover and 40 pounds corn silage, the following was given: 4 pounds of corn-and-cob meal, 1 pound of wheat bran, 2½ pounds of malt sprouts, and 2½ pounds of cottonseed meal. On account of the malt sprouts it will be better if this ration were moistened with water containing some stock molasses and the quantity increased slightly.

The above ration is enough for a 1,000-pound cow giving about 12 or 14 quarts of good quality milk. The cost of this ration per ton, with grains at present prices, corn-and-cob meal at $20 a ton containing 65 percent corn, Jersey wheat bran at $25 a ton, malt sprouts at $26 and cottonseed meal at $36, would be $26. This feed ration would contain 17.43 percent digestible protein and 23.78 percent total protein. Dried brewers' grains may be substituted for the malt sprouts if more convenient without materially changing the analysis. If clover hay is fed instead of the corn stover the amount of corn-and-cob meal can be increased about 100 pounds and 50 pounds taken off the malt sprouts and cottonseed meal. This will cheapen the grain ration still further.

Prof. Cook also told something about his work with cow-testing associations,

A WELL-BRED PROFIT-PRODUCER IS THE BEST INCENTIVE TO BETTER DAIRYING

corn silage is fed the year round with alfalfa hay; while green forage crops, such as corn and alfalfa, are given in addition in the summer when work is light, replacing most of the grain ration. Without the forage crops a ration is fed of one pound of grain to every four pounds of milk produced. If the dairyman has no silage, Prof. Cook recommended the use of roots, beet pulp, or soaking malt sprouts, dried grains or the entire grain ration with water in which a little molasses has been added for flavor. The feed should not be made sloppy but simply given as much water as it will soak up and remain moist.

The third requirement of a good dairy ration is palatability. Grains should be used which cows like and a sufficient variety so that they will eat all that is required. This is especially true in the roughage ration. Poor hay and silage should never be fed.

In the fourth place, a dairy ration should be economical, that is, should be made up of the cheapest feeds available. Alfalfa hay and corn silage with green alfalfa and green corn in summer make up the cheapest forms of roughage. The most economical grain ration varies somewhat with the market, but at present prices corn-and-cob meal at $20 or $22 is the cheapest basis of the ration and source of carbohydrates and fat. Corn-and-cob meal has practically the same feeding value, pound for pound, as straight corn meal and costs almost one-third less. In one experiment carried out for over one hundred days the New Jersey Experiment Station found that the feeding of corn-and-cob meal instead of corn meal

and of their value to the dairymen. A cow-testing association is made up of 24 or 25 dairymen owning about 500 cows. These men hire a man whom they call an official tester, who visits each member once a month and keeps a complete record of the pounds of milk, pounds of butter fat, pounds of feed and net profit of each individual cow. This record is computed for a year and furnished to each member of the association. The idea originated in Denmark and has been very successful there and in this country. Two associations are at present being successfully operated in New Jersey.

Of these associations, that in Sussex county is securing an increased milk production, with lower cost, and thereby increased profits to the dairymen. F. L. Champion, cow tester of this association reports that in several instances where the cost of production had increased because the members give better feed and more feed to their cows, the increased returns have more than paid for the larger cost of feeding. Twenty-one dairymen, who own 520 cows, are now members of the association, and all report increased incomes thru the tests. Mr. Champion tests each cow once a month. The milk is carefully weighed and the cost of the feed given the animal is computed. "Boarder" cows are disposed of as soon as possible, after it is learned that they do not pay their way. Thus, thru the association's work, a dairyman is able to separate the wheat from the chaff, and keep only the animals that pay.

It is to be hoped that the producer will eventually get a better price for

The Watch Tower of Prosperity
Get ready to build a silo for 1914. We have a special EARLY BUYERS' Proposition which will be of interest. A new book by Benjamin Quod, "The Watch Tower of Prosperity," our new catalog and other literature will be mailed free upon request.
Write for them today. Address nearest office.
The INDIANA SILO is the Watch-tower that marks the advancing line of progress in agriculture. It stands like a beacon light to the farmers and points the way of safety to those whose course to independence is beset by crop failures and high price feed. The
INDIANA SILO
is the easiest silo to erect and keep in order. The mechanical features found only on the INDIANA SILO make it the best silo to be had. Dollar for dollar it gives the greatest services of all silos and if used according to our instructions it will last a lifetime. It increases production; it lessons labor and doubles profits. It is not an experiment. It is not sold on promises but on the strength of its own past performances.
More INDIANA SILOS are in use on American stock farms than of any other make.
The contents of an INDIANA SILO are never endangered as the INDIANA SILO never gives trouble while filled.
The INDIANA SILO is not affected by the settling or cracking of foundation; there is no danger of cracked or bursted walls. Wood is a non-conductor and no loss results through improper curing through lack of heat or absorption of the juices.
The present high price of feed stuff and of live stock makes it imperative that the farmers of America conserve the wealth which their acres produce.

International Special Molasses Feed
A REENFORCING FEED.
A WONDERFUL MILK PRODUCER.
SAVES MONEY ON YOUR FEED BILL.
INTERNATIONAL SPECIAL MOLASSES FEED is a reenforcing feed composed of cotton seed meal, molasses and ground grains. Contains far more energy than ordinary mill feeds. It is the best feed you can buy for mixing with ensilage or home grown grains, also used for mixing with Gluten and Brewer's grains.
Use International Special Molasses Feed and you will save money on your feed bill and largely increase your milk production. Our feeding directions will tell you how to obtain a balanced ration in combination with any other feeds. Sample of feed and complete feeding directions sent free for the asking.
Ask your dealer for International Special Molasses Feed. If he don't keep it for sale, then send us your dealer's name and address--we will arrange with him to supply you.
INTERNATIONAL SUGAR FEED COMPANY
M. W. SAVAGE, PRES., MINNEAPOLIS, MINN. (2)

$15.95 AND UPWARD SENT ON TRIAL
AMERICAN CREAM SEPARATOR
Thousands In Use giving splendid satisfaction justifies your investigating our wonderful offer to furnish a brand new, well made, easy running, easily cleaned, perfect skimming separator for only $15.95. Skims one quart of milk a minute, warm or cold. Makes thick or thin cream. Different from this picture, which illustrates our low priced large capacity machines. The bowl is a sanitary marvel and embodies all our latest improvements.
Our Twenty-Year Guarantee Protects You
Our wonderfully low prices and high quality on all sizes and generous terms of trial will astonish you. Whether your dairy is large or small, or if you have an old separator of any make you wish to exchange, do not fail to get our great offer. Our richly illustrated catalog, sent free of charge on request, is the most complete, elaborate and expensive book on Cream Separators issued by any concern in the world. Western orders filled from Western points. Write today for our catalog and see for yourself what a big money saving proposition we will make you. Address,
AMERICAN SEPARATOR CO., Box 1062 Bainbridge, N. Y.

This Book Describes a Better Silo
IT'S full of valuable information on ensilage and describes the silo that preserves it in a fresh, sweet and succulent condition right down to the last forkful. The
NATCO IMPERISHABLE SILO
is built of hollow blocks of vitrified clay. Each layer reinforced with continuous steel bands. There are no staves to warp, shrink or split. No hoops to tighten. No repairs or painting. Any mason can erect a Natco Imperishable Silo and it lasts for generations. A monument to your good judgment and an asset to your permanent farm buildings.

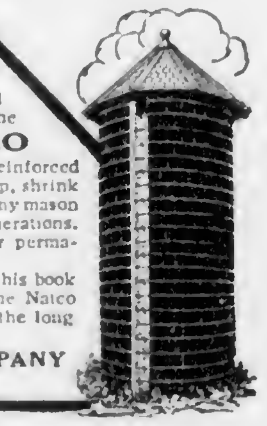
NATIONAL FIRE PROOFING COMPANY
Philadelphia, Pa.



his milk. A few years ago a good dairy cow could be bought for from $35 to $50, while the same grade of cows now commands from $75 to $125. The increase in the cost of feed is another item to be considered, and again the increase in the cost of farm labor. The increase in taxes on farms is still another item which enters into the general cost and which adds to the evidence that the consumer will soon be called upon to pay more for the milk used in his household. The cost of distribution has also increased—horses and feed cost more, horse shoeing, help, bottles, caps,—a total average increase of about 50 percent. With all these increases added to the cost of production, the producer gets no more for his milk than he did under former conditions. However, it seems inevitable that the price of milk must go up to meet these conditions. Eight eggs are worth 32 cents, but they supply no more nutrients than a quart of milk costing but 8 cents. The present tendency of milk prices is upward, and it's dollars to doughnuts that as they go up, they will stay up.—D. T. Hendrickson, Monmouth County, N. J.

DAIRY RATION

R. D. G. asks for directions in balancing a dairy ration from materials indicated by the following reply:

The inquirer has two kinds of roughage, corn stover and mixed hay. It is rather desirable to have two roughages, but it would have been much more satisfactory if the mixed hay had contained a large amount of clover. As it is it requires a much larger amount of concentrates and these concentrates must be rich in protein. However, if he will feed about seven pounds of his mixed hay and five pounds of the corn fodder, one in the morning and the other in the evening and feed about twelve pounds of the following mixture the ration will be nearly balanced: 200 pounds bran, 100 pounds corn meal, 100 pounds gluten and 150 pounds linseed meal.

It is possible that if the prices had been given for the feeds it would have been possible to have figured one a little cheaper. However, this contains bran to give bulk, and with the linseed meal should have a good effect upon the digestive system. A satisfactory ration should always contain something succulent, such as silage or roots. Potatoes are not the most satisfactory roots to feed to dairy cows, but they are the one which the farmer often has. The trouble with feeding many potatoes is that they are inclined to scour the animal. However, I should think that the inquirer could feed these up to five pounds a day to each cow with satisfaction.—Prof. F. S. Putney, Penna State College.

MUNICIPAL RESTRICTIONS UPON SALE OF MILK

A. W. R., Montgomery Co., Pa., asks for a brief statement of the state law relative to the pasteurization of milk in city markets.

There is no state law in Pennsylvania requiring milk to be pasteurized before being offered for sale in city markets. The state law, in general, prohibits the sale of adulterated milk, and also of skimmed milk unless labeled as such, and empowers the proper branches of the municipal governments to inspect all milk offered for sale, to adopt necessary rules and regulations, and to require a license from persons who sell milk.

Each municipal government has power to enact reasonable ordinances in the exercise of its police power. Included within the valid exercises of this police power are regulations passed in the interest of the health, morals, and safety of the public. Unquestionably, ordinances regulating the sale of milk are within the police power if their requirements are reasonable and have a real tendency to protect the health of the people. There seems no doubt but that an ordinance requiring the pasteurization of all milk sold in city markets would be a reasonable regulation passed in the interests of the public health, and therefore a valid exercise of the police power.

It matters not that the person who offers the milk for sale resides outside of the city. If he takes the milk within the city for the purpose of selling it, he becomes subject to the municipal regulations, just as a person who enters the city in an automobile becomes subject to the traffic regulations, and the municipal authorities can prevent such sale unless their regulations are complied with, provided as above mentioned, that the regulations are reasonable.—G. G. & H.

GOOD HOLSTEIN PRICES

The Second Consignment Sale of the Liverpool Sale & Pedigree Company, January 27 and 28, drew a crowd of over 500. The contributors were mostly New York breeders with the addition of Bernard Meyers, of Finderne, N. J., and Patterson Brothers, of Wellsboro, Pa. The visitors came from many states of the Union, one of the largest buyers coming from Washington. A total of 178 animals was sold during the two days, and the total sales amounted to $48,180. The average was $270 which was certainly good, considering that many of the animals were young. Among the prices realized was $1,000 for the cow, Pauline Clyde Wayne, consigned by Stevens Brothers' Company and purchased by John Arfmann, of Middletown, N. Y.; $1,405, for the heifer, Finderne Countess Pontiac, consigned by Bernhard Meyers, and purchased by Oakhurst Farms, Gloversville, N. Y. The heifer calf, Doris King of the Pontiacs, was consigned by James Male, of New York. She was purchased for $810 by Jabez Smith of Newark Valley, N. Y., and was resold after the sale to William Bishop of Chimacum, Washington, for $900. Mr. Bishop was one of the largest buyers at the sale and his animals were of good individuality and high-class breeding.

The highest priced animal in the sale was King Pontiac Posch, a son of King of the Pontiacs from a 31-lb. granddaughter of DeKol 2d's Paul De Kol. He was purchased for $2,900 by C. W. Decker, of Newark Valley, N. Y. His consignor, Jabez Smith, re-purchased a half interest in this bull. The yearling bull, Sir Johanna Rag Apple De Kol, consigned by James Gibson of White Plains, N. Y., was purchased for $2,050 by Archie Reed, Jr., of Jamesville, Wis.

THE DAIRY COW AS A FARM RENOVATOR

The dairy cow is always at home. For three hundred and sixty-five nights and at least one hundred days she is kept where all her droppings can be saved. She returns to the soil a larger part of the fertility of the food she eats than any other living animal. In fact, 99 percent of all she eats except the small amount required to sustain life is returned to the soil. About 75 percent in her voidings is liquid and solid, and 24 percent is the by-products of her milk which are fed to other stock, and thus returned, less than one percent being sold as butter-fat.

When reckoning the profits of a dairy, these by-products are not often considered, but considering the increasing demand for commercial fertilizer on nearly all our farms and the depleted condition of many of them, the manure must be ranked high. Without the elements of fertility in the soil our receipts for fat would soon be gone. Three gallons of skim milk or butter milk, if properly fed, will produce one pound of dressed pork. The average cow will produce enough milk in a year to grow and fatten a two-hundred pound pig, with five bushels of corn to finish.

With proper care, the litter from these two animals will fertilize an acre of corn which will more than pay for the hauling and the tillage of the corn. Many of the profitable methods have been worked out on Eastern farms. There are few eastern farms of sixty acres that can not support 15 cows and if these were attended properly would yield more profit than if these acres were devoted entirely to grain.

I have mentioned only corn as a means of turning your manure into feed; in many places this could be more profitably done by raising alfalfa or sweet clover. Cattle may not readily take to this sweet clover, but when once they learn to eat it, they will leave alfalfa for it. It will seed itself for many years, unless pastured very hard. It is very rich in nitrogen as are all legumes and dairy cows do well on it. If dairy cows and legumes were on more of the eastern farms, there would be less occasion for costly commercial fertilizer and the soil would not suffer from their absence.—H. E. Roudabush, Center Co., Pa.

Injured Brain.—We have a bull that appears to be hurt in head, for he showed no bad symptoms until he had a fight with cow. This accident occurred last Saturday and on Sunday when let out of stable he appeared lightheaded. When turned out he usually walks in a circle, going to left. We poured sweet oil into his ear which appeared to make him some better. He has a good appetite, but seems unable to drink. W. W. M., East Waterford, Pa.—Give your bull 2 dr. potassium iodide at a dose, 3 times a day; also give ½ oz. bromide of potash at a dose, 3 times a day. His bowels should be kept open and active.

Another Oleo Question.—In the Court of Appeals there has recently been argued a question of peculiar interest, viz: Has the state a right to prohibit a person from selling or giving away with the sale of oleo, any coloring matter? The object would be to allow the customer to color the oleo for himself. The attorney general contends that the buyer would then be doing an act which the law sought to prohibit. He says the statute does not forbid the sale or gift of the coloring matter except at the precise time the sale of the oleo is made. It is an interesting proposition, to say the least.

Intensive Tillage.—No one farm implement has contributed more to the growth and possibilities of intensive tillage than the Cutaway harrow. Practical farmers are finding new uses for this machine every season, and its efficiency in old uses is demonstrated everywhere. A new booklet describing its construction and giving many valuable hints as to its use has recently been published under the title of "The Soil and Intensive Tillage." The booklet is free to our readers who will write to the Cutaway Harrow Co., 983 Main St., Higganum, Conn., asking for it.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.

Unadilla Silos Are Trustworthy

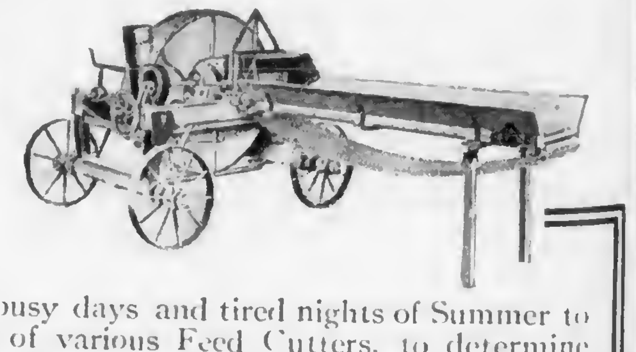
CAREFUL PLANNING BRINGS SUCCESS



Don't wait until your busy days and tired nights of Summer to investigate the merits of various Feed Cutters, to determine which line or which equipment.—These long Winter evenings afford the very best opportunity for thorough study and comparison.—Do it now.

WRITE TO-DAY FOR OUR FREE CATALOGUE OF WHIRLWIND SILO FILLERS and for those describing other makes—compare 'em point by point, machine against machine, and let your later purchase be governed by a carefully worked out Winter decision—that's a better scheme than the snap judgment of Summer and Fall rush.

Whirlwind Silo Fillers

differ from all others—they are the best—and we only ask for an opportunity to prove this to your satisfaction: five sizes, on skid or wheels, plain or traveling apron feed tables, three to forty tons per hour guaranteed capacity with 3 to 22 H. P. Gasoline Engine. To be included in a Whirlwind a piece of cast-iron must withstand at least 9000 lbs. per sq. inch, greater strains than the commoner grades used by others. Every part perfect and so guaranteed.

Remember it's a free catalogue.

Hood Farm, Lowell, Mass.
January 22, 1914.

The Quaker Oats Co., Chicago, Ill.

Gentlemen:—It will probably interest you to know that we have been feeding **Schumacher Stock Feed** to Sophie 19th, of Hood Farm, 189748. She finished her last record January 20, 1914, which makes her the Champion Jersey Cow of the world, and stamps her the greatest dairy cow living or dead. We consider **Schumacher Stock Feed** a splendid feed for dairy cows, and a strong factor in increasing the milk and butter production. Very truly yours,

Hood Farm, per J. E. Dodge, Mgr.

Sensational Record of Sophie 19th

For the year ending January 20, 1914.

Milk—17,557 lbs. ...12 ozs.
Butter—1,175 lbs. ..... 7 ozs.
Butter Fat—995 lbs. ...12 ozs.

Total Record for Five Years

Milk—64,253 lbs. ..... 2 ozs.
Butter Fat—3,781 lbs. ..12 ozs.
Butter—4,424 lbs. .....13 ozs.

FEED PROVES

Greater Than BREED

From The Philadelphia Record

The World's Champion Ayrshire cow—AUCHENBRAIN BROWN KATE 4TH—was tested under the supervision of the Pennsylvania Experiment Station. She gave during the year 23,022 lbs. of milk or 10,820 quarts at a cost of less than 1 3-4 cts. a quart, making an income from her milk, above cost of feed consumed, of $541.

It is said that this cow has made a quart of milk and a pound of butter at the least cost of food consumed by any cow of any breed.

Narberth, Pa., December 6, 1913

The Quaker Oats Company, Chicago, Ill.,

Gentlemen:—We have been feeding your **Schumacher Stock Feed** to our Ayrshire and Jersey cows which are on test for Official Records, and like it mixed with other grains. Our World's Champion Ayrshire Cow, AUCHENBRAIN BROWN KATE 4TH, who has just finished her year's work with a record of 23,022 lbs. milk and 1080 lbs. of butter, was fed **Schumacher Stock Feed** as part of her ration. We find that **Schumacher Stock Feed** is one of the best feeds we have ever used in our mixtures. Yours very truly,

(Signed) E. S. Deubler, Superintendent, PENSHURST FARM.

World's Records Smashed Again!

Many Breeds—BUT—All Fed One Feed!

Again and again, during the past year, the world has been astonished at the marvelous productions of milk and butter from single cows. Think of getting over 8¾ tons of milk and over ½ ton of butter from one cow in one year.

First one breed, then another, and still another have smashed all previous world's records, until in amazement we ask, "Is it possible," and "how can it be done?"

The answer no longer is "getting the right breed." Instead, "it's getting the right feed" and the right individual. Feed has proved greater than breed! This is conclusively proved by the fact, that regardless of the breed of these "Queens of the Dairy World"—be it Jersey, Holstein, or Ayrshire, which have "beaten" all records to date—they were all fed the same feed—the world famous, record-making, record-breaking—

Schumacher Feed

Therefore, we proudly—justly—proclaim that "Feed—SCHUMACHER FEED—proves greater than breed." Read the wonderful world's records just achieved by Sophie 19th of the Hood Jersey Farm, who finished her yearly test Jan. 20, 1914. Then read what Auchenbrain Brown Kate 4th, Queen of the Ayrshires accomplished—the cow which has the distinction of producing more milk and butter at least cost of any cow in the world. Then read the record of the first cow in the world to produce 40 pounds of butter in a week—Valdessa Scott 2nd. Then read the record of the second 40 lb. cow and note that all these remarkable, sensational performances were made with SCHUMACHER FEED as a base of their rations. Read their owners' letters. It needs no further evidence to convince anyone that SCHUMACHER FEED is the "best in the world." If it is "best" for the "best cows in the world" it certainly is best for your cows.

Try This Record-Breaking Feeding Plan

—a plan used by the World's Record makers, and you will be surprised at the results: Mix three parts SCHUMACHER with one part of any good high protein concentrate you are now feeding, such as Gluten, Cottonseed Meal, Distillers' Grains, Oil Meal, Malt Sprouts or Blue Ribbon Dairy Feed. Your cows will not only show a splendid increase in flow but in due time will show a splendid improvement in health, vigor and appearance. SCHUMACHER furnishes that stamina—vitality—ability—to stand up under heavy milk production, so necessary in profit-producing dairy cows.

FREE FEEDING FACTS If interested, write us for "Feeding Facts" and get some information worth hundreds of dollars to any dairyman or farmer.

THE QUAKER OATS COMPANY,
Dept. 21 CHICAGO, U. S. A.

[25]

If your dealer does not sell SCHUMACHER write us.

Valdessa Scott 2nd The First 40 Lb. Cow in the World.

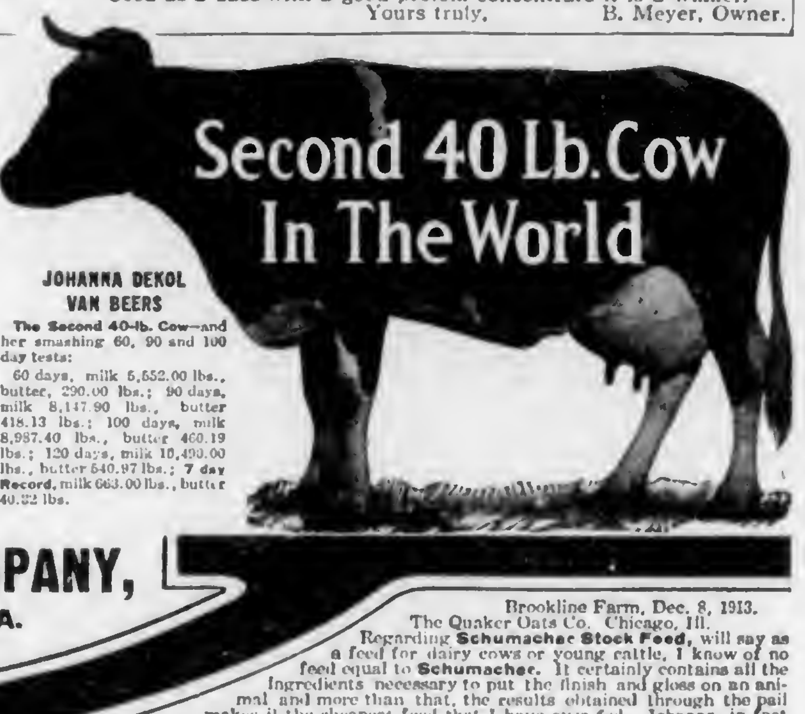
In 30 days' test she produced 2933.9 lbs. of milk and 165½ lbs. of butter. Her one day record is 108.6 lbs. of milk and 6 lbs. of butter. One week record (7 days) 695.1 lbs. of milk and 41.875 lbs. butter. Milk test 4.70% butter fat.

Finderne Stock Farm, Finderne, N. J.

The Quaker Oats Co., Chicago, Ill.

Gentlemen:—During the past two or three years we have been feeding your **Schumacher Feed** and have secured splendid results. **Schumacher** was incorporated in the ration of Valdessa Scott 2nd during her wonderful result producing test. Used as a base with a good protein concentrate it is a winner.

Yours truly, B. Meyer, Owner.



JOHANNA DEKOL VAN BEERS

The Second 40-lb. Cow—and her smashing 60, 90 and 100 day tests:

60 days, milk 5,552.00 lbs., butter, 290.00 lbs.; 90 days, milk 8,147.90 lbs., butter 418.13 lbs.; 100 days, milk 8,987.40 lbs., butter 460.19 lbs.; 120 days, milk 10,490.00 lbs., butter 540.97 lbs.; **7 day Record**, milk 663.00 lbs., butter 40.32 lbs.

Brookline Farm, Dec. 8, 1913.

The Quaker Oats Co. Chicago, Ill.

Regarding **Schumacher Stock Feed**, will say as a feed for dairy cows or young cattle, I know of no feed equal to **Schumacher**. It certainly contains all the ingredients necessary to put the finish and gloss on an animal and more than that, the results obtained through the pail makes it the cheapest feed that I have ever fed. Johanna, in fact all my cows are fed every day a ration of **Schumacher Feed.** To any one feeding cattle for show, I would especially recommend **Schumacher**

Yours truly, T. E. Getzelman, Prop., Hampshire, Ill

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

Chapter XX concluded.

“You mean, why do I not deny what you have no doubt heard?” he said. “What could one gain by that if you had heard the truth?”

Maud Barrington laughed softly. “Isn't the question useless?”

“No,” said Winston, a trifle hoarsely now.

The girl touched his arm almost imperiously as he turned his head again.

“Lance,” she said. “Men of your kind need not deal in subterfuge. The wheat and the bridge you built speak for you.”

“Still,” persisted Winston, and the girl checked him with a smile.

“I fancy you are wasting time,” she said. “Now, I wonder whether, when you were in England, you ever saw a play founded on an incident in the life of a once famous actor. At the time it rather appealed to me. The hero, with a chivalric purpose assumed various shortcomings he had really no sympathy with—but while there is, of course, no similarity beyond the generous impulse, between the cases—he did not do it clumsily. It is, however, a trifle difficult to understand what purpose you could have, and one cannot help fancying that you owe a little to Silverdale and yourself.”

It was a somewhat daring parallel, for Winston, who dare not look at his companion and saw that he had failed, knew the play.

“Isn't the subject a trifle difficult?” he asked.

“Then,” said Maud Barrington, “we will end it. Still, you promised that I should understand—a good deal—when the time came.”

Winston nodded gravely. “You shall,” he said.

Then, somewhat to his embarrassment, the two figures moved further across the window, and as they were silhouetted against the blue duskiness, he saw that there was an arm about the waist of the girl's white dress. He became sensible that Maud Barrington saw it too, and then that, perhaps to save the situation, she was smiling. The two figures, however, vanished, and a minute later a young girl in a long white dress came in, and stood still, apparently dismayed when she saw Maud Barrington. She did not notice Winston, who sat further in the shadow. He, however, saw her face suddenly crimson.

“Have you been here long?” she asked.

“Yes,” said Maud Barrington, with a significant glance towards the window. “At least ten minutes. I am sorry, but I really couldn't help it. It was very hot in the other room, and Allender was singing.”

“Then,” said the girl, with a little tremor in her voice, “you will not tell!”

“No,” said Maud Barrington. “But you must not do it again.”

The girl stooped swiftly and kissed her, then recoiled with a gasp when she saw the man, but Maud Barrington laughed.

“I think,” she said, “I can answer for Mr. Courthorne's silence. Still, when I have an opportunity, I am going to lecture you.”

Winston turned with a twinkle he could not quite repress in his eyes, and with a flutter of her dress the girl whisked away.

“I'm afraid this makes me an accessory, but I can only neglect my manifest duty, which would be to warn her mother,” said Maud Barrington.

“Is it a duty?” asked Winston, feeling that the further he drifted away from the previous topic the better it would be for him.

“Some people would fancy so,” said his companion. “Lily will have a good deal of money, by and by, and she is very young. Atterly has nothing but an unprofitable farm; but he is an honest lad, and I know she is very fond of him.”

“And would that count against the dollars?”

Maud Barrington laughed a little. “Yes,” she said quietly. “I think it would if the girl is wise. Even now such things do happen, but I fancy it is time I went back again.”

She moved away, but Winston stayed where he was until the lad came in with a cigar in his hand.

“Hallo, Courthorne!” he said. “Did you notice anybody pass the window a little while ago?”

“You are the first to come in thru it,” said Winston dryly. “The kind of things you wear admit of climbing.”

The lad glanced at him with a trace of embarrassment.

“I don't quite understand you, but I meant a man,” he said. “He was walking curiously, as if he was half-asleep, but he slipped round the corner of the building and I lost him.”

Winston laughed. “There's a want of finish in the tale, but you needn't worry about me. I didn't see a man.”

“There is rather less wisdom than usual in your remarks to-night, but I tell you I saw him,” said the lad.

He passed on, and a minute later there was a cry from the inner room. “It's there again! Can't you see the face at the window?”

Winston was in the larger room next moment, and saw, as a startled girl had evidently done, a face that showed distorted and white to ghastliness thru the window. He also recognized it, and running back thru the hall was outside in another few seconds. Courthorne was leaning against one of the casements as tho faint with weakness or pain, and collapsed when Winston dragged him backwards into the shadow. He had scarcely laid him down when the window opened, and Colonel Barrington's shoulders showed black against the light.

“Come outside alone, sir,” said Winston.

Barrington did so, and Winston stood so that no light fell on the pallid face in the grass. It's a man I have dealings with,” he said. “He has evidently ridden out from the settlement and fallen from his horse.”

“Why should he fall?” asked the Colonel.

Winston laughed. “There is a perfume about him that is tolerably conclusive. I was, however, on the point of going, and if you will tell your hired man to get my wagon out, I'll take him away quietly. You can make light of the affair to the others.”

“Yes,” said Barrington. “Unless you think the man is hurt, that would be best, but we'll keep him if you like.”

“No, sir. I couldn't trouble you,” said Winston hastily. “Men of his kind are also very hard to kill.”

Five minutes later he and the hired man hoisted Courthorne into the wagon and packed some hay about him, while, soon after the rattle of wheels sank into the silence of the prairie, the girl Maud Barrington had spoken to rejoined her companion.

“Could Courthorne have seen you coming in?” he asked.

“Yes,” said the girl, blushing. “He did.”

“Then it can't be helped, and, after all, Courthorne wouldn't talk, even if he wasn't what he is,” said the lad. “You don't know why, and I'm not going to tell you, but it wouldn't become him.”

“You don't mean Maud Barrington?” asked his companion.

“No,” said the lad, with a laugh. “Courthorne is not like me. He has no sense. It's quite another kind of a girl, you see.”

CHAPTER XXII

Colonel Barrington Is Convinced

It was not until early morning that Courthorne awakened from the stupor he sank into soon after Winston conveyed him into his homestead. First, however, he asked for a little food, and ate it with apparent difficulty. When Winston came in he looked up from the bed where he lay, with the dust still white upon his clothing, and his face showed gray and haggard in the creeping light.

“I'm feeling a trifle better now,” he said; “still, I scarcely fancy I could get up just yet. I gave you a little surprise last night?”

Winston nodded. “You did. Of course, I knew how much your promise was worth, but in view of the risks you ran, I had not expected you to run up at the Grange.”

“The risks!” said Courthorne, with an unpleasant smile.

“Yes,” said Winston wearily, “I have a good deal on hand I would like to finish up here and it will not take me long, but I am quite prepared to give myself up now, if it is necessary.”

Courthorne laughed. “I don't think you need, and it wouldn't be wise. You see, even if you made out your innocence, which you couldn't do, you rendered yourself an accessory by not denouncing me long ago. I fancy we can come to an understanding which would be pleasanter to both of us.”

“The difficulty,” said Winston, “is that an understanding is useless when made with a man who never keeps his word.”

“Well,” said Courthorne dryly, “we shall gain nothing by paying each other compliments, and whether you believe it or otherwise, it was not by intention I turned up at the Grange. I was coming here from a place west of the settlement, and you can see that I have been ill if you look at me. I counted too much on my strength, couldn't find a homestead where I could get anything to eat, and the rest mak be accounted for by the execrable brandy I had with me. Any way, the horse threw me and made off, and after lying under some willows a good deal of the day I dragged myself along until I saw a house.”

“That,” said Winston, “is beside the question. What do you want of me? Money in all probability. Well you will not get it.”

“I'm afraid I'm scarcely fit for a discussion now,” said Courthorne. “The fact is, it hurts me to talk, and there's an aggressiveness about you which isn't pleasant to a badly-shaken man. Wait until this evening, but there is no necessity for you to ride to the outpost before you have heard me.”

“I'm not sure it would be advisable to leave you here,” said Winston dryly.

Courthorne smiled ironically. “Use your eyes. Would any one expect me to get up and indulge in a fresh folly? Leave me a little brandy—I need it—and go about your work. You'll certainly find me here when you want me.”

Winston, glancing at the man's face, considered this very probable, and went out. He found his cook, who could be trusted, and said to him, “The man yonder is tolerably sick, and you'll let him have a little brandy and something to eat when he asks for it. Still, you'll bring the decanter away with you, and lock him in whenever you go out.”

The man nodded, and making a hasty breakfast, Winston, who had business at several outlying farms, mounted and rode away. It was evening before he returned, and found Courthorne lying in a big chair with a cigar in his hand, languidly debonair but apparently ill. His face was curiously pallid, and his eyes dimmer than they had been but there was a sardonic twinkle in them.

“You take a look at the decanter,” said the man, who went up with Winston, carrying a lamp. “He's been wanting brandy all the time, but it doesn't seem to have muddled him.”

Winston dismissed the man and sat down in front of Courthorne.

“Well?” he said.

Courthorne laughed. “You ought to be a witty man, tho one would scarcely charge you with that. You surmised correctly this morning. It is money I want.”

“You had my answer.”

“Of course. Still, I don't want very much in the meanwhile, and you haven't heard what led up to the demand, or why I came back to you. You are evidently not curious, but I'm going to tell you. Soon after I left you, I fell very sick, and lay in the saloon of a little desolate settlement for days. The place was suffocating, and the wind blew the alkali dust in. They had only horrible brandy, and bitter water to drink it with, and I lay there on my back, panting, with the flies crawling over me. I knew if I stayed any longer it would finish me, and when there came a merciful cool day I got myself into the saddle and started off to find you. I don't quite know how I made the journey, and during a good deal of it I couldn't see the prairie, but I knew you would feel there was an obligation on you to do something for me. Of course, I could put it differently.”

Winston had as little liking for Courthore as he had ever had, but he remembered the time when he had lain very sick in his lonely log hut. He also remembered that everything he now held belonged to this man.

“You made the bargain,” he said, less decisively.

Courthorne nodded. “Still, I fancy one of the conditions could be modified. Now, if I wait for another three months, I may be dead before the reckoning comes, and while that probably wouldn't grieve you, I could, when it appeared advisable, send for a magistrate and make a deposition.”

“You could,” said Winston. “I have, however, something of the same kind in contemplation.”

Courthorne smiled curiously. “I don't know that it will be necessary. Carry me on until you have sold your crop, and then make a reasonable offer, and it's probable you may still keep what you have at Silverdale. To be quite frank, I've a notion that my time in this world is tolerably limited, and I want a last taste of all it has to offer a man of my capacities before I leave it. One is long while dead, you know.”

Winston nodded, for he understood. He had also during the grim cares of the lean years known the fierce longing for one deep draught of the wine of pleasure, whatever it afterwards cost him.

“It was that which induced you to look for a little relaxation at the settlement at my expense,” he said. “A trifle paltry, wasn't it?”

Courthorne laughed. “It seems you don't know me yet. That was a frolic, indulged in out of humor, for your benefit. You see, your role demanded a good deal more ability than you ever displayed in it, and it did not seem fitting that a very puritanical and priggish person should pose as me at Silverdale. The little affair was the one touch of verisimilitude about the thing. No doubt my worthy connections are grieving over your lapse.”

“My sense of humor had never much chance of developing,” said Winston grimly. “What is the matter with you?”

“Pulmonary hemorrhage!” said Courthorne. “Perhaps it was born in me, but I never had much trouble until after that night in the snow at the river. Would you care to hear about it? We're not fond of each other, but after the steer-drivers I've been herding with, it's a relief to talk to a man of moderate intelligence.”

“Go on,” said Winston.

“Well,” said Courthorne, “when the trooper was close behind me, my horse went thru the ice, but somehow I crawled out. We were almost across the river, and it was snowing fast, while I had a fancy that I might have saved the horse, but, as the troopers would probably have seen a mounted man, I let him go. The stream sucked him under, and tho you may not believe it, I felt very mean when I saw nothing but the hole in the ice. Then, as the troopers didn't seem inclined to cross, I went on thru the snow, and, as it happened, blundered across Jardine's old shanty. There was still a little prairie hay in the place, and I lay in it until morning, dragging fresh armfuls around me as I burnt it in the stove. Did you ever spend a night, wet thru, in a place that was ten to twenty under freezing?”

“Yes,” said Winston dryly. “I have done it twice.”

“Well,” said Courthorne, “I fancy that night narrowed in my life for me, but I made out across the prairie in the morning, and as we had a good many friends up and down the country, one of them took care of me.”

Winston sat silent a while. The story had held his attention, and the frankness of the man who lay panting a little in his chair had its effect on him. There was no sound from the prairie, and the house was very still.

“Why did you kill Shannon?” he asked, at length.

“Is any one quite sure of his motives? said Courthorne. “The lad had done something which was difficult to forgive him, but I think I should have let him go if he hadn't recognized me. The world is tolerably good to the man who has no scruples, you see, and I took all it offered me, while it did not seem fitting that a clod of a trooper without capacity for enjoyment, or much more sensibility than the beast he rode, should put an end to all my opportunities. Still, it was only when he tried to warn his comrades he threw his last chance away.”

Winston shivered a little at the dispassionate brutality of the speech, and then checked the anger that came upon him.

(To be continued.)

Quick on the Trigger With a Snap-Shot Eye

THE crack trapshooter has to have steady nerves and muscles absolutely under control—always ready to swing his gun into place and bring down his claypigeon. This means trained, not to the minute, but to the split-second.

We present the names of some famous crack shots. They like to smoke, but take no chances on a tobacco that might “throw them off.” They use Tuxedo because it is mild, relaxing, steadying—strictly pure.

GEORGE W. MAXWELL
leading trapshooter
“I find complete enjoyment in Tuxedo. It's a nerve steadier and a sure fire, slow-burning tobacco.”
Geo W Maxwell

TOM A. MARSHALL
famous crack shot
“Tuxedo tobacco is unquestionably the acme of perfection; smoking Tuxedo makes life better worth living.”
Tom A. Marshall

FRED GILBERT
celebrated trapshooter
“The coolest, most fragrant tobacco to my experience—Tuxedo. Leads in mildness and purity.”
Fred Gilbert

Tuxedo
The Perfect Tobacco for Pipe and Cigarette

Tuxedo is made of only the finest, choicest, selected leaves of perfectly aged Burley tobacco. It is made by the original “Tuxedo Process” which removes *every trace* of *bite* and *sting* and develops *all* the wonderful mildness, fragrance and flavor of the Burley Leaf in a way that no other brand of tobacco has ever successfully imitated.

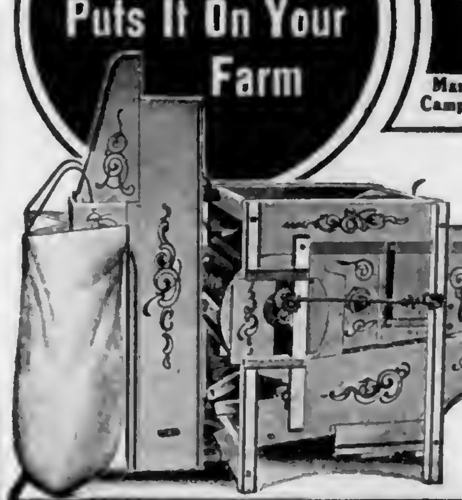
$1.00 Puts It On Your Farm

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain



THE CHATHAM Grain Grader and Cleaner

Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut.
Cleans the dirtiest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.)
Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet “slick as a whistle.”
Takes Buckhorn from Clover.
Sorts Corn for Drop Planter.
Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc.
Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Easiest running mill.

You can't afford to plant common Seed and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for **one paltry dollar.**

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my “Chatham,” send it back at my expense and I will return the dollar.

A “Made-to-Order” Machine

Every “Chatham” is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality.* That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience.

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this.

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my **Book** by **return mail.** Address nearest office.

NEW YORK PRODUCE

New York City, Feb 9, 1914.

The butter market showed little change. First class grade was scarce and well cleaned up at good prices. The cold weather has made the butter market unsettled and irregular. Receipts of fresh killed poultry show considerably lighter this week. Fruits and vegetables show little change.

Eggs.—State and near by hennery whites, fine to fancy, 39@40c; gathered whites, 39c; fair to good 37@38c; no grades, 33@36c fresh gathered firsts to extras, 30½@34c; seconds to thirds, 26@29c; no grades 20@23c; mixed 30@31c.

Butter.—Creamery, firsts to extras, 25½@27½c; thirds to seconds, 21@25c; state dairy, 19@27c; packing stock 15@19c; process 19½@23c.

Cheese.—Whole milk specials, 18@18½c do. common to fancy, 16@17¼c; skims 5@14¼c.

Dressed Poultry.—Turkeys, dry, 23@25c, chickens, 14@25c; fowls 12@18½c; old roosters, 13½c; ducks 10@16c.

Live Poultry.—Prices not settled.

Vegetables.—Cabbage, $22.00@25.00 ton. Green beans, $1.00@4.50 bas. Carrots $1@1.25 bag. Cucumbers, $1@1.75 doz. Lettuce 50c@$2 basket. Squash, $2.25@3 bbl. Celery, $1.50@2.00 per stan. case. Onions $2.50@2.75 100-lb bag. Tomatoes, $1.00@3.50 carrier. Peppers $1.25@1.75 per carrier. Beets, $3@4 per 100 bunches. Potatoes, $2.50@5.25 bbl. Sweet potatoes, $1.50@2.00 bbl. Eggplants, $2.50@3.50 box. Cauliflower $1.00@1.75 bas.

Fruit.—Apples, $2.00@6.00 bbl. Cranberries $9@13 bbl. Pears, $2@3.75 bbl.

Grain.—Wheat No. 2, red $1.01; No. 1, Northern, $1.03; corn, new, No. 3, yellow, new 59⅝c; oats, standard white 44½@45c.

YORK PRODUCE MARKET

York, Pa., Feb. 9, 1914.

The markets were well filled with buyers and farmers all of last week. Seasonable supplies were plentiful and prices remained unchanged except on butter and eggs. Butter is weak and several cents lower. Eggs declined from 8 to 10 cents per dozen.

Eggs.—24@34c.

Butter.—Country, 30@35c; separator, 35@38c. Milk, 6c per quart. Cream, 12c per pint.

Poultry.—Hens 14@15c lb; springers 15c lb. Dressed poultry, 40@75c each.

Vegetables.—Potatoes 8@15c ½-pk; 75@80c bu; cabbage 3@10c each; lettuce, 3@6c; beets, 3@5c bch; radishes, 5c bch; onions 5c bch., 12@16c per ½-pk; lima beans, 12@14c qt; sweet potatoes, 12@15 per ½-pk.; lard 14@16c lb; celery, 5@12c; peppers, 8@12c doz; turnips, 6@10c per ½-pk, soup beans, 10@12c qt; sauer kraut, 5@8c qt; apple butter, 18@22c qt.

Fruit.—Apples, 10@30c ½-pk; pears, 10@25c per ½-pk; chestnuts, 10@15c qt; walnuts, 15c per ½-pk.

Retail Grain Market.—Wheat, $1.05 bu; corn, 82c; oats, 55c; rye, 77c; bran, $1.40 cwt.; middlings, $1.50 cwt.

Wholesale Grain Market.—Wheat, 95c; corn, 70c; oats, 46c; rye, 67c.

WILMINGTON PRODUCE.

Wilmington, Del., Feb. 9, 1914.

Butter.—Print butter, 38@45c lb. Creamery roll, 35@45c.

Poultry.—Chickens, dressed, 18@25c; ducks, 18@20c.

Eggs.—38@45c doz.

Vegetables.—Potatoes 10@12c ¼-pk. Cabbage, new, 4c up. Sweet potatoes, 50c bas. Onions, 10@15c ¼-pk. Eggplants, 10c each. Peppers, 10@15c doz. Parsley, 1@5c bch. Lettuce, 8@10c bch. Beets, 5@8c bch, Cauliflower, 10@20c each.

Fruit.—Apples, 10@25c ¼-pk. Pineapples, 20@25c apiece. Grapes, 10@15c lb. Oranges, California, 25@30c doz. Florida, 35@50c doz. Bananas, 10@15c doz. Pears, 10@15c ¼-pk. Cranberries, 10@15c quart. Quinces, 20@25c ¼-pk. Grape fruit, 7@10c each.

PHILADELPHIA LIVE STOCK

Philadelphia, Pa., Feb. 9, 1914.

Beef Cattle.—There was a better inquiry for desirable stock and the choicest steers brought firmer values. Offerings were mainly of Virginia, Ohio and Lancaster Co., Pa., cattle in moderate but sufficient numbers. Cows and calves of the most satisfactory kinds ruled steady under a moderate demand.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	2,575	8,291	5,839

Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do.	6.50@7.00

Sheep and Lambs.—Current supplies showed a fair disposal at well maintained prices, the run of stock being rather moderate, the market closed in good shape.

Choice wethers	5.75@6.00
Good do.	5.00@5.25
Common to medium	3.00@4.25
Ewes, fat	5.00@5.50
Extra lambs	8.25@8.50
Good to choice, do.	8.00@8.25
Common to medium	5.50@8.00

Hogs.—The market closed with prices advancing. Trade was normal. Western, as to size and quality $12.50@12.75.

City Dressed Stock.—Every kind of choice and prime meat commanded full values, with inquiry seasonable. Steers, 11@13½c; heifers, 10½@13c; cows, 8@11c. Veal calves, 14@15c, country dressed calves, 11@15c; extra do., 15½c. Sheep, 9@11c. extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., Feb. 9, 1914.

Cattle.—The supply on sale was 100 loads against 130 loads the week before. Market ruled slow with prices about steady on choice heavy cattle, while the light and medium grades ruled 10 to 15c per cwt. lower. The bulk of the offerings was of light and medium grades. Heifers, fat cows and bulls ruled about steady on all grades except bolognas which were higher. Best fresh cows about steady, medium grades and springers lower. Arrivals this morning numbered 75 loads. The market was active and higher on all grades.

Good to choice	$8.80@9.15
Good 1,300-1,400 lb	8.40@8.70
Medium to good 1,200-1,300 lb	8.10@8.30
Tidy 1,050-1,150 lb	8.15@8.35
Fair to medium, 900-1,100 lb	7.50@7.85
Rough, half-fat, 1,000-1,300 lb	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700-900 lb.	5.50@6.50
Common to good fat bulls	5.00@7.50
Common to good fat cows	4.00@6.50
Heifers	5.50@7.75
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@90.00

Calves.—The supply of calves was fair and market closed 50 cents per cwt. higher under good demand. With 500 head on sale, the market was steady today.

Heavy and thin calves	$5.50@8.00
Veal calves	8.00@11.50

Sheep and Lambs.—The week's supply was liberal, and under fair demand sold steady all week. Twelve loads came in on active market today. Quotations are 25c higher.

Prime wethers	$6.10@6.35
Good mixed	5.40@5.65
Fair mixed ewes and wethers	4.25@5.00
Culls to common	3.00@3.50
Spring lambs	5.00@8.25

Hogs.—The week's supply has been fair and under good demand sold active and higher each day, closing 25 to 30c higher than Monday. Fifty double-deck loads arrived today. The market was steady to 5c higher.

Prime heavy	$9.25@
Prime medium weights	9.35@
Heavy mixed	9.25@
Best heavy Yorkers	9.35@
Light Yorkers	9.35@
Pigs	9.15@9.25
Common to good roughs	7.75@8.35
Stags	6.75@7.25

BALTIMORE LIVE STOCK

Baltimore, Md., Feb. 9, 1914.

Cattle.—Receipts for the week, 1,494 head against 2,169 last week.

Steers	$6.25@8.35

Sheep and lamb receipts 10,100 head. Market strong.

Sheep	$4.00@5.75
Culls	6.25@7.00
Spring lambs	7.25@8.25

Hog receipts 13,500 head. Market higher. Choice, $9.25@9.50; roughs, $8.15@8.50.

BUFFALO LIVE STOCK

Buffalo, N. Y., Feb. 9, 1914.

Cattle.—The basis during the week was about 15c higher than the opening on strictly choice kinds. The close was active and firm on best, easy on common grades. Today's receipts were 3,500 head; prices ruled 10 to 15c higher.

Choice heavy steers	$8.75@9.15
Medium	7.50@8.70
Yearlings	8.00@8.50
Handy butchers	7.75@8.35
Good to choice fat cows	6.00@7.00
Good to choice heifers	6.00@7.50
Butcher bulls	6.00@7.50
Feeders	6.25@7.00
Stockers	5.00@6.25
Cows and springers	30.00@90.00

Calves.—Opening was 75 cents higher or $11.75@12.25; common and medium grades firmer. Supply was liberal on close, and the basis $11.75@12. Today's receipts were 1,000 head, and market ruled strong.

Choice veals	$11.50@12.00
Lights and thin	6.00@8.75

Sheep and Lambs.—The opening was moderate with strictly choice lambs higher. On the close receipts were liberal and included a good supply of holdovers; market generally active. Good lambs active on the basis of $8@8.15. Yearlings in light supply, active demand and higher; basis, $6.50@7.25. Extreme heavy sheep light demand. Today's receipts were 15,000 head, market ruled steady.

Choice lambs	$8.25@8.40
Poorer grades	6.50@7.50
Yearlings	6.50@7.25
Wethers	6.00@6.30
Ewes	5.00@5.50
Sheep	3.50@5.75

Hogs.—Light opening receipts. Mixed hogs in good demand, good roughs firmer. Closed active and higher. Yorker basis, $9.15@9.25. Heavy hogs sold to local buyers at an advance. Today's receipts were 13,600 head, and market steady.

Heavies	$9.15@
Mixed and medium	9.15@9.20
Yorkers	9.20@9.25
Light Yorkers	9.20@9.25
Pigs	9.20@9.25
Roughs	8.15@8.40
Stags	6.25@7.25

Horses.—Offerings 600, demand quiet on advance. Today's receipts were 500 head. Choice heavy teams in fair demand at $600@650, medium grades, $100@500.—S.

PITTSBURGH HAY AND GRAIN MARKET

Pittsburgh, Pa., Feb. 9, 1914.

Hay.—The receipts of hay have shown quite a heavy decrease during the week and at this writing they are remarkably light, as are also billings in transit. The yards are cleaning up rapidly and while no noticeable advance is expected a stronger market is looked for. It is thought that it would be better to market a few cars now, as it is believed that there will be heavy shipments to this market later in the spring.

No. 1 timothy	$17.50@18.00
No. 2 timothy	14.00@16.00
No. 3 timothy	10.00@12.00
No. 1 light mixed	14.50@15.00
No. 1 clover mixed	13.50@14.00
No. 2 clover mixed	10.00@12.00
No. 1 clover	13.00@13.50
No. 2 clover	10.00@12.00

Straw.—Oat and wheat straw dull; a little inquiry for rye. Market quiet.

No. 1 oat	$8.75@9.00
No. 2 oat	8.00@8.25
No. 1 wheat	8.25@8.50
No. 2 wheat	7.75@8.25
No. 1 rye	9.00@9.25
No 2 rye	8.00@8.50

Ear Corn.—There is a good demand for sound No. 2 yellow ear, while receipts are but noraml.

New No. 2 yellow	69@69½c.
New No. 3 yellow	66@67c.

Shelled Corn.—Market does not seem to improve on this commodity; demand somewhat lax; supply sufficient.

New No. 2 yellow	70½@71c.
New yellow No. 3, natural	68½@69½c.
New sample	64@66c.

Oats.—While receipts are light, demand is only moderate; buyers holding off anticipating lower values.

No. 2 white	43@43½c.
Standard oats	42½@43c.
Standard No. 3 oats	41½@42c.

Mill Feed.—Very little inquiry; market dull.

No. 2 white midds.	$27.00@27.50
No. 1 brown midds	25.00@25.50
W. W. Bran, coarse,	26.00@26.50
W. W. Bran, medium	24.50@25.00

NEW YORK HAY MARKET.

New York City, Feb. 7, 1914.

Hay prices remain generally steady on all grades. There is a fair demand for the better grades. Receipts today were 1,463 tons. Timothy, No. 1, $1.05 bale; standard 97½@$1.00. No. 2, 90@95c; No. 3, 80@85c; clover 85@97½c.

Straw.—Straws remains generally quiet. Receipts 20 tons. Oats straw 50@75c bale; rye 80@85c.

NEW YORK MILK MARKET

New York City, Feb. 9, 1914.

The supply is considerably in excess of the demand, which is unusually slow for February. Those dealers who delayed installing pasteurizing apparatus in preparation for the enforcement on February 1, of the ruling of the Board of Health that, with the exception of certified and guaranteed milk, all milk sold in the city should be pasteurized, now find themselves in a predicament owing to the announcement by Dr. S. S. Goldwater, the new Commissioner of Health, that enforcement would not be postponed to suit the convenience of the delinquents. Some of the dealers had hoped to secure another postponement. Their plea was that they could not get the machinery in time. They have known for a long time that pasteurizing would ultimately be required, but have been hoping that something could and would be done which would make the expenditure of capital for machinery unnecessary. It is estimated that considerably more than 200,000 quarts of raw milk is entering the city daily contrary to the regulation. Pasteurizing will add perhaps 15 cents a can to the cost of preparing the milk for market. It is not expected, however, that this will immediately be added to the retail price. It is thought that ultimately, perhaps next fall, the retail price of bottled milk will go up to 10c. Some special brands are now selling at that rate. Farmers will probably receive $1.50 a can for their February milk.

The receipts of milk and cream in 40-quart cans for the week ending February 7, were as follows:

Railroad	Milk	Cream
Erie	42,731	1,889
Susquehanna	8,772	749
West Shore	16,010	649
Lackawanna	51,110	1,275
N. Y. Central (long haul)	77,725	1,398
N. Y. Central (short haul)	11,510	85
Ontario	42,115	2,688
Lehigh Valley	36,897	921
Homer Ramsdell Line	3,870	31
New Haven	9,364	81
Pennsylvania	2,374	311
Other sources	1,650	13
Total	304,128	10,123

ELGIN BUTTER QUOTATION

Elgin, Ill., Feb. 9, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter strong at 26½c.

CHICAGO HORSE MARKET

Horses were marketed much less freely than a year ago, but the demand was correspondingly small and prices no better, inferior animals being hard to dispose of around $75@100 per head, while prime to extra drafters of heavy weight were so scarce as to be almost nominal at $300@350. Few horses went as high as $275, with desirable wagoners going at $200@250, and drivers taken sparingly around $100@150, and occasionally at a higher price. Farm geldings moved off fairly at $125@195. While farm mares were wanted at $190@225. Several pairs of farm geldings went at $300@385.—F.

TOBACCO MARKET

The first advance in prices noted this season came during the week, probably owing to the interest incident to the proposed pooling movement. Heretofore the few sales that were made were at $8 to $10 per cwt whereas at present prices are at $10 and up. Another encouraging feature is the evident high quality of crop. It is also noted that the large factories have entered the market for supplies which is always the signal for packers to begin buying. The competition thus created and the other conditions noted form together an outlook more favorable than for some time. Following are representative sales made during the week. Fifteen acres seed leaf at $10; 13 acres seed leaf at $10.25 and 1 acre Havana at $13 and $1 per cwt.

Much interest centered in the meeting of the proposed Seed Leaf Growers' Company of Lancaster, as promoted by R. L. Kinbrough, of Lexington, Ky. However, a permanent organization was not effected. The organizer claims to have the support of 172 growers the names of whom were not divulged. In contrast with this claim it is rather noteworthy that but 40 growers attended the meeting. An expression of these showed that they would ask $10 per cwt. for wrappers and $2@4 per cwt for fillers. Mr Kimbrough explained the methods pursued by Kentucky growers in past years and the method by which he proposed to unite the growers of this state. It seems that if possible, members would sell their tobacco at shed as heretofore but at a price not below that stipulated by the organization; otherwise it would be delivered to the company's warehouse and there held and handled awaiting sale. While here the owner would be protected by a warhouse receipt upon which he could borrow money from local banks. The proposed contract covers a period of seven years and provides for public tobacco markets. The following scale of prices is included $10 and $2.50 per cwt for 1913; $11@$3 for 1914; $12@$2.50 for 1915; $13@$4 for 1916; $14@$4.50 for 1917 and $15@$5 for 1918.—H. E. Tweed, February, 9, 1914.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. When reply by mail is requested, it becaues private practice and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Thoroughpin—Bruised Leg.—I have a six-year-old horse that has thoroughpin. What can I do for it? I also have a mare that was kicked on hind leg, causing soreness and lameness. On account of standing so long on one leg she is now stiff in both legs. H. L. K., Roulette, Pa.—You will obtain fairly good results by applying 1 part red iodide mercury and 8 parts cerate of cantharides to thoroughpin, 3 times a month. You had better apply 1 part iodine and 10 parts lard to enlarged joint or thickened portion of leg of your mare, 3 times a week.

Wart on Shin.—I have a 4-year-old cow that has what appears to be a large wart situated between hock and foot of hind leg. This bunch appears to be growing and getting more tender as she limps whenever it touches the ground. G. L. E., Covington, Pa.—Either apply lunar caustic once a day or burn bunch with a red-hot iron every day or two, or cut off bunch and apply equal parts powdered alum and tannic acid, twice a day.

Bitter Milk.—I would like to know what to do for a cow that gives bitter milk for a period of three or four months before calving time. The cow is five years old and apparently healthy, a fine milker and due to freshen in April. She has daily exercise in the open air and access to plenty of fresh water. G. J., Flemington, N. J.—The very best you can do is to furnish your cow with a good wholesome food, keep her in a clean, well-ventilated stable and give her 3 drams of salicylic acid and 1 oz. of powdered charcoal at a dose in each feed, and salt her well. Look well to the utensils in which the milk is handled. Scald and store them in bright sunlight.

Warbles.—Nearly every year my cattle have been troubled more or less with grubs in their back. One of my neighbors recommends washing their backs with strong brine, but before doing so, I would like to have your opinion. B. T. H., Sharon City, Pa.—Many people apply strong salt and water to the backs of cattle in the fall to prevent or kill the larvae or ox warble grub. Warbles come from eggs deposited about the heels and breast and fore-legs of cattle in summer. These eggs are swallowed and seem to penetrate the walls of the gullet and work thru the tissues and lodge under the skin along the back of the animal. I have never thought it good practice to kill the grubs and allow them to decompose in the back of the cattle, but rather prefer to make the opening in the skin large enough so that the grub can be squeezed out, then killed, which of course will prevent any future multiplication of this pest. After squeezing out the grubs, I usually apply an antiseptic lotion such as 1 part bichloride mercury and 500 parts water, or 3 percent solution of carbolic acid or a good home-made healing remedy. It is always good practice to destroy the larvae or eggs that are deposited by the ox warble fly.

Leg Weakness in Poultry.—Several of my hens appear to be affected with leg weakness. Some of them are hardly aule to walk. L. T. S., Sandy Lake, Pa.—Leg weakness is not a disease, but the result of other ailments which cause more or less debility. Are you sure that your fowls are not lousy and have you applied kerosene to roosts to kill mites? Have you recently cleaned and whitewashed your roost? Their roosting place may be damp and with no sunlight. Increase their food supply, add a little ginger, cayenne pepper and salt to each feed.

Mange.—My hogs appear to have an itchy condition of skin and nearly all of them are inclined to rub. K. S. O., Espyville, Pa.—Mix 1 part sulphur, ½ part carbonate potash and 3 parts fresh lard. Then apply to itchy parts of body, 2 or 3 times a week. Give them 10 drops Fowler's solution at a dose in feed, 2 or 3 times a day.

FIRE PROOF STORM PROOF
EASY TO PUT ON LASTING AND ORNAMENTAL
Dickelman "Cluster" METAL SHINGLES
Furnish a perfect roof at low cost. Made of 99.9% pure, open-hearth iron, properly galvanized for lasting service. Easily and quickly laid with hammer and nails. Special side and end-lock makes them absolutely water-proof. Investigate sure by writing today for catalog about
"The Roof of Quality"
Tells why we can sell all "Dex" quality products under 15 year guarantee. Gives reasons why "Dex" Roofing cannot rust, split, crack or blow off. Shows how to lay all kinds of metal roofing. Let us mail you this useful book FREE! Write for it today. A post card will do.

Don't Feed the Soil — Feed the Plant
In the top eight inches of average soil there is enough plant food in the form of nitrogen to last for 90 years, in phosphoric acid for 500 years and in potash for 1000 years.
And yet that very spot may prove barren. Plants have to take up their food in solution, in the "sap of the soil." All this food may be locked up so tightly by nature that the plants can't get at it fast enough for the commercial farmer, and he has to put in the same food in the soluble form of fertilizer.
Just so, a fertilizer may, by analysis, have all the necessary elements and yet not give the plant full value because these elements are not readily soluble.
Put into your ground a fertilizer that will feed not your already overstocked soil but your hungry crops with food which is available and easily absorbed.
Bowker's Fertilizers
have chemically correct elements—there is a brand to fit every need. More than that, these chemicals are blended and mixed so that they are rendered water-soluble and go into your ground in the most available form. Most crops do most of their feeding in 60 days.
Write for our illustrated catalogue, based on forty years of experience. In writing, state what your crops are.
BOWKER FERTILIZER COMPANY 43 Chatham Street, Boston, Mass.

For Every Farmer

Who Wants Better and Bigger Garden Crops

HERE are two books---"Farmers' Encyclopedias," they have been called. You can get them both without cost.

The first--the Henderson Tested Seed Book, "Everything for the Garden"--contains 204 pages 14 pages in full color, fine enough to frame, folks tell us, over 1000 illustrations. Page after page of Prize Garden Truck and the *proof* that *you* can get better and bigger, more profitable yields.

The Garden Guide and Record is 67 years scientific garden *experience* condensed into 64 pages.

It is a *reference* book for the experienced farmer and a text book for those less expert in the profitable line of garden farming. Gives practical suggestions and definite knowledge for increasing yields. Also

For the Farmer's Wife

This book contains recipes for canning every kind of garden vegetable by Mrs. Rorer, the world-famous culinary expert. And remember, Mrs. Rorer's Cook Books have a big sale at $2.00 a copy.

How to Get These Books

But you can't buy either of these books.

They are gotten up to spread the gospel of better profits through **tested** seeds and hence you can get them free of cost.

Send us 10c in stamps or silver, mentioning the name of this paper and we will send you a collection of six packets of the Best Seeds we have—specialties of our own introduction. With these we will include the Seed Book, "Everything for the Garden." Here's what the specialty collection consists of—one packet each of the following world famous varieties:

Ponderosa Tomato
Scarlet Globe Radish
Big Boston Lettuce
Giant Spencer Sweet Peas
Mammoth Butterfly Pansies
Henderson's Invincible Asters

What's more, these packets are enclosed in a **coupon** envelope which, when emptied and returned to us, will be accepted as 25c cash payment on an order for Henderson's Tested Seeds amounting to $1.00 or over.

Now about the Garden Record and Guide. This is intended for our **customers only.** So with your first dollar order—on which you can use cash coupon envelope—we enclose this book without charge if requested.

ONLY ONE TO A PERSON

Of course this is purely an introductory offer. It is intended to give you the opportunity to prove the satisfaction and profit of using Henderson's Tested Seeds. So only one introductory packet is sent to a person.

TESTED SEEDS MEAN PRIZE CROPS AND PROFITS

"WE get as much fruit from one acre of your Ponderosa Tomatoes as from six of other varieties," one man writes.

"I have used all of your sweet corns and have found them excellent, but my favorite is Country Gentleman. It is absolutely the best and your stock seems to be so much superior to that of other dealers. I presume this is because you originated it."

'I have beaten my whole neighborhood with the Prosperity Peas I got from you," still another testifies.

These are samples of the results gotten with Tested Seeds.

The Henderson Seed Book, "Everything for the Garden," contains hundreds of such reports from practical farmers testifying to the EXTRA PROFIT obtained by using Henderson's Tested Seeds,—and don't forget there's a mighty sight of personal satisfaction as well as actual profit in raising Extra fine garden truck.

Remember Peter Henderson & Co. is 67 years old. Our business has increased steadily because our seeds get big results for our customers.

Today we sell more seeds to practical market gardeners than any other seed house in America--that's a fact you can't afford to over look.

Feeding Cattle on Eastern Farms.

By Prof. W. H. TOMHAVE,
Pennsylvania State College.

The feeding of beef cattle on the farms in the Eastern part of the United States has never been as extensively conducted as in the "corn belt." This is in part due to the system of farming and the lack of proper facilities and feeds to compete with the large feeding centers of the middle west. There are sections in the East, however, where it has for many years been a part of the business of farming. Instead of selling from the farms the corn and hay produced, they were fed to cattle with the result that the fertility of the soil was increased from year to year. While at times it seemed that such a practice meant a financial loss to the feeders, they were able to produce better crops, resulting in indirect returns which more than paid for the crops fed on the farm.

As an illustration of this type of farming may be cited Lancaster County, Pennsylvania, where the farmers have been feeding annually from 40,000 to 60,000 head of cattle. This county is known as the richest agricultural county in the United States and much of this distinction is due to the persistency with which these farmers have fed cattle from year to year in order to maintain the fertility of the corn and tobacco fields. Such a system of farming has made it possible to build fine homes and farm buildings and perfect a rich agricultural section.

If such a system of farming had been conducted in many other parts of the East there would today be very few deserted farms. It is obvious that deserted farms are primarily due to the depleted condition of the soil, caused by continuous cropping and selling all crops produced. With every ton of grain sold, there is a loss to the farm of from $4 to $6 worth of soil fertility, which is about 25 percent of the price received for the grain or hay. If the same grain had been fed to cattle it would have taken only about $1 to $6 worth of fertility for every ton of live animals sold. The live stock converts the grain crop into more concentrated form, with the increased valuation of the livestock; only about 5 percent would leave the farm from the fertility standpoint with stock feeding.

The feeding of beef cattle is not a "Get rich quick" system of farming. It is a system that cannot be successfully conducted unless it is consistently a part of the farm business. The farmer who has cattle in the feed lot the good years as well as the poor years is the one who can depend on a profit for a series of years. The East is particularly well adapted to the feeding of beef cattle because of the large amount of roughage produced. When this is fed to good cattle a market is provided for this roughage that cannot otherwise be obtained. The cattle will not have the degree of finish that is obtained by long grain feeding, yet the cheapness of gains made offsets the difference in price received when the cattle are sold. In many sections the farms are located some distance from the railroads, which makes it expensive hauling bulky crops to market. If these same crops were fed to beef cattle, the cattle, when ready for market, could be driven to the railroads and thus reduce the cost of transportation.

A LOT OF FEEDING STEERS WHEN FIRST PUT ON FEED.

THE SAME LOT OF STEERS WHEN FINISHED AND READY FOR MARKET.

The profits received from cattle feeding are largely determined by the type of cattle selected for the feed lot. Cattle of beef breeding are to be preferred. Steers of dairy or scrub breeding cannot be relied upon to make substantial gains in the feed lot, nor will they bring the price upon the market when sold. The scrubs are just as costly as feeders as they are in the dairy. An off-type steer is a poor feeder and a poor seller. The only time a person is warranted in putting cattle of such type in the feed lot is when they can be purchased on an exceptionally wide margin. Even under such conditions there is little satisfaction in working with cattle that do not make good use of the feed consumed. The margin between the price paid for cattle when put in the feed lot and the selling price will depend upon the value of the cattle and the price of feeds. It will generally range from 65 cents to $1.25 per hundred pounds.

The cost or value of the feed consumed is an important item in cattle feeding. The cheapest combination that can be fed must be considered, even tho the daily gains are not so large as from a more expensive combination. The combination from which the cheapest pound of gain can be produced is generally the one to feed. The method of feeding cattle in many regions of Pennsylvania and the East is the same as it was twenty years ago, not keeping pace with other lines. In most cases it is an expensive method, due to the combination used. A common Pennsylvania steer feeding ration is made up of corn, bran, hay and corn stover. This combination is usually fed as soon as the cattle are put in the feed lot and they are early put on a full grain ration.

This grain mixture is made up of about four parts of bran to eight to ten parts of ear corn, by weight. The bran is fed as a source of protein, which becomes very expensive at its present price of $25 per ton. It contains only about 12 pounds of protein for each 100 pounds, while cottonseed meal contains 37 pounds per hundred, or three times as much and only costs $10 more per ton. Not only can a saving be made by substituting two pounds of cottonseed meal for 4 or 5 pounds of bran, but also by feeding more roughage during the first two months of the feeding period and saving the grain for the latter part. On a recent visit to some cattle feeders, I found that the daily cost of feed per steer was about 26 cents per day per head just after the cattle were on full feed. This cost could be materially reduced by feeding cottonseed meal in place of bran and feeding only a small amount of corn and more hay and stover.

The cheapest and most satisfactory method of

(Continued on page fifteen.)

Cutaway (CLARK)

Disk Tools for Intensive Tillage

There isn't a farmer in America but who should own at least one CUTAWAY (CLARK) disk harrow or plow.

Over 100 Styles and Sizes

Ask us about the DOUBLE ACTION ENGINE HARROW, the DOUBLE ACTION—REGULAR, the DOUBLE ACTION—EXTENSION HEAD—(for orchard work), the SINGLE ACTION—REGULAR, the SINGLE ACTION—EXTENSION HEAD—(for orchard work), the BUSH AND BOG PLOW, the CORN AND COTTON HARROW, the RIGHT LAP PLOW, the CALIFORNIA ORCHARD PLOW, or the one-horse harrows and cultivators, whichever it may be that you need. Ask your dealer to show you a CUTAWAY (CLARK) machine. Do not accept a substitute. Write us for catalog.

The Cutaway Harrow Company
Maker of the original CLARK disk harrows and plows
983 Main Street, Higganum, Conn.

BOOK FREE "The Soil and Intensive Tillage"

The disks are forged sharp

Sows Fertilizers QUICKLY EVENLY

Sows broadcast or in rows all kinds of commercial fertilizers—nitrate, phosphate, guano, lime, ashes, etc. Distributes it fast and evenly in amounts from one hundred to several thousand pounds per acre. Simple and strong. Gauge is easily and quickly set.

The Chicopee Line

STEVENS

Fertilizer Sower

Has only force feed which will sow successfully all kinds of commercial fertilizers in large or small quantities. No springs or gears in box. Order one this season. We'll refer you to a dealer if none near you. Send today for 64-page Catalog of Chicopee Line tools—the line of 61 years' sterling reputation. There's an implement for every farm need.

Belcher & Taylor Agricultural Tool Co.

Care and Treatment of Seed Potatoes

Identifying Irish Cobblers.

By E. A. ROGERS, Cumberland Co., Me.

In my first article I tried to bring out some of the causes of getting a poor stand of plants even when good seed had been used. There is a great deal of complaint of mixed seed, especially Irish Cobblers, and the loss from mixed seed alone runs into hundreds of thousands of dollars.

Where a late variety, like the Green Mountain, is mixed with an early one like the Cobbler, the loss is almost in direct proportion to the percentage of Green Mountains that are mixed in. This is especially true where the Cobblers are to be dug as early as they will make a crop. On the other hand, if digging is delayed for the Green Mountains to mature, the Cobblers will ripen off and the crab grass will take possession and the cost of digging is greatly increased.

There is but little excuse for the Northern seed grower to raise mixed Irish Cobblers, and there is but little more for the Southern grower to plant them mixed after he has received them. I know of no potato so easily made true to name as is the Irish Cobbler. It is a harder proposition for the grower in the South to true them up than it is for the grower in the North, for the reason that the southern grower plants very early, before heavy frosts cease. Yet I am satisfied that it will pay anyone who is making potato-growing a considerable part of his season's crops to have a proper building to prepare his seed potatoes in.

Take Irish Cobbler potatoes and spread them out, one deep, in the direct rays of the sun, and in four or five days they will turn almost purple in color. A Green Mountain or most all white sprouts which includes the Early Eureka, will turn green; a very light green at first, and will be in this light green stage when the Cobbler shows purple. Following this practice, one can pick out his Cobblers nearly as easily as tho they were apples.

As the southern grower plants very early he claims he has no time for this, which I know to be the case. Hence the need of a building as mentioned above. This building should be made with plenty of window space, as it is the sun's rays that turn the Irish Cobbler purple. If they are allowed to green up slowly in a light place, without the direct rays of the sun, the difference in color will not be marked, and separation will be more difficult, if not impossible. Such a building should be fitted for heating and the temperature kept around 60 degrees, and the potatoes kept here a week or ten days before cutting and planting. If one is cramped for room, the potatoes can be spread six inches or even a foot deep on the floor if they are shoveled over as often as every two or three days; this, of course, after the Cobblers have been separated from any other variety that may be mixed with them.

I am firmly convinced that such a building will pay for itself many times over in a very few years. In fact, I believe that the increase in the crop of a single year will more than pay all the cost of such a building which can be used for other purposes ten months in the year. A gain of ten days in maturity is one of the advantages in having such a building. Potatoes will make a greater gain by being in the warmth and light for ten days previous to planting than they possibly can make by being in the soil. If one will take two barrels of seed tubers which are hard and eyes started but little, and plant one on April first and spread the other in a building such as I have described for ten days, and then plant, the last planted will mature first and in most cases will give a greater yield.

So far I have not spoken of disease. There is much of this in a great deal of so-called seed stock, and there is but little need of it in the case of most of the diseases we now have to contend with. No grower should plant diseased stock, for the diseased portion will never make him any money. It might far better be thrown away in the beginning than to be planted and left to contaminate that which was free. The writer has had black-leg, fusarium, early and late blight, and knows from actual experience what it means. This was before he learned how to get rid of those diseases. In our crop of 1913, if we have a trace of either, I have been unable to find it up to present writing, and we are using from a bushel to a bushel and a half of potatoes every week in my family. It required but little work and was not costly to accomplish this.

Living so far north, I do not need a greening-up house, as I can spread my seed tubers outdoors before they have started to sprout with no danger of freezing. Outdoors is really the only fit place to put potatoes intended for seed after they have once begun to sprout in the cellar. Where possible, north or south, when potatoes intended for planting begin to sprout they should be gotten out and first soaked for two hours in a solution of formaldehyde, one pint of the 40 percent solution to 30 gallons of water. I believe this to be much more effective than the gas treatment. This soaking will kill all disease germs that there may be on the outside of the tubers and also any sprouts that may have started. Now if the potatoes are spread out in the light and sun for ten days or until the eyes begin to get lively again, each eye has the same chance and the plants will come up much more even. If these potatoes are spread out on a turf where but little grass grows and are kept raked over so that the eyes on the under side cannot root into the ground, they will keep in fine condition for planting until wanted; in our section they will keep until killed by October's frosts.

Could the writer have the cutting of the seed done just to suit him, he would not have any of it cut over 48 or less than 24 hours ahead of the planter. This of course is impossible at times. Each man cutting should have two knives, ground very thin. I have never yet been able to buy a knife thin enough for this purpose without grinding. A pint glass preserving jar filled with strong solution of the formaldehyde should be handy to each one cutting, and when any potato is cut into that shows any discoloration whatever, which may be an evidence of three or four diseases, it should be thrown away and the knife placed in the jar of formaldehyde and the other knife used to cut the next tubers. In this manner nearly all diseases will be eliminated. This has proved to be the case with the writer, and while at the beginning as high as 25 percent of the seed tubers were thrown away, the present indications are that the loss from this source will not be over a fraction of one percent the coming season.

Land plaster or sulphur should be dusted upon the tubers when cutting, shaking them up until all the cut surfaces are covered. I prefer the sulphur as it seems to keep wire-worms and grubs away from the seed better than gypsum, but is more disagreeable to one's eyes when planting, especially on a windy day. The potato grower who will follow out these directions, whether he lives north or south, using at all times his own common sense and judgment will find that a poor stand of plants or a poor crop will become a rare occurrence with him. With a quarantine against all foreign potatoes, it is now up to the American grower to produce enough for the country's needs, and he has a right to do this at a profit provided he uses those methods which will insure him a paying crop.

A NEW GET-RICH-QUICK SCHEME EXPLAINED

A Seed Swindle

During the last few weeks the Seed Laboratory of the New Jersey Agricultural Experiment Stations has been uncovering one of the most flagrant cases of seed adulteration and misrepresentation, so far reported. The details of the scheme are given to the public that those who have occasion to buy seed may be warned and that those who have bought some of the seed herein described may be informed of the quality if they have not already carefully examined their purchase.

The first intimation of this new bunco game came from Warren County about the middle of December, 1913, in the form of a sample of seed which analyzed about 20 percent of red clover seed and 80 percent German millet seed. This sample represented a lot of seed sold by a Mr. O. J. Rice, who claimed to be a representative of the Rice Seed Co., dealing in tested seeds and having seed arms in Cambridge, New York. This statement and the argument that the price of best grade clover seed such as e offered would be greatly increased by pring, made it possible to sell a con- derable amount of seed.

Investigation showed that after the ders were secured, Mr. Rice sent an der to one of the well-known seed rms in New York City for so many bu- els of clover seed and so many of erman millet. When these were re- ived the two kinds were mixed and e individual orders made up from the ixture. To supply the orders taken a certain section of Warren county, r. Rice ordered 27 bushels of German illet and one and a half bushels of red over seed. The gross profit on bushel of this mixture in which e proportions of each were deter- ned by actual analysis was about 4.71. It is interesting to note in is connection that if Mr. Rice had un- ertaken to sell good clover seed at the te of $9 per bushel, he would be los- g $2.40 on every bushel sold, since bushel of 60 lbs. at 19 cents per pound st him $11.40 at New York.

Since the first reports of sales of this rt were received, other similar samples nd reports have been received from Middlesex, Sussex, Ocean and Bergen unties. Some variations have also een reported, the principal one being e introduction of Australian clover, hich gives two or three cuttings a sea- n. Several were induced to try this the considerate price of 30 cents a und. When this seed was examined y the seed analyst, it was found to be ne other than crimson clover seed hich should not cost above 10 cents a und. In looking over the analyses ade of samples received at the seed boratory prior to November first, 1913, instance was reported where a party d purchased parsley seed at 80 cents pound from Mr. Rice and had received rimson clover seed. At the time this curred, it was thought that there must ave been an error in shipping and no re attention was given to the matter. Present developments lead one to think hat the error was committed in buy- g from Mr. Rice. He is now in the ands of the law. In default of bail e is awaiting the action of the Grand ury of Middlesex County.

There are several valuable lessons in is case. First, it is not good business buy seed, fruit trees or gold bricks from agents who have no standing in e community or who cannot furnish tisfactory references to your bank or other responsible parties. The banks re responsible to a certain extent for he protection of your account from cer- ain of our population. It is safer to uy from local merchants or other es- ablished and reliable firms from whom ou can obtain satisfaction in case of ecessity without hiring a detective to cate them. Secondly, in the case of his particular commodity, it should be ealized that the profits from the sale f a few bushels of good seed are so mall that an agent could not pay ex- enses unless he charged exorbitant ates. Otherwise he must resort to adul- eration of some form to unduly increase he profits. Then too, the farmer should ake it a point to know what his crop eeds look like or else submit samples o the Seed Laboratory before purchase nd also after purchase to check the rst sample.

The Seed Laboratory does not attempt say what shall be sold in the State, or can it issue injunctions against armers restraining them from buying nferior goods from unreliable sources. ut if the farmer will make the best of is opportunities and use the Seed La- oratory as indicated, it will then be lmost impossible for agents or others ngaged in selling seeds to take unfair dvantage of his lack of thoro know- edge of all farm seeds.—John P. Hel- ar, Seed Analyst, New Jersey Experi- ent Station.

FARM EXPERTS AND EXPERT FARMERS

With the passage of the bill for agri- ultural extension work by both houses f Congress we have presented to us fresh the question of more farm ex- erts, more people at fancy pay to tell us how we are to do things; more peo- le to add to that already large army ho are intent on getting the American farmer to make two blades of grass grow where one grew before without any regard as to whether the growth of that extra blade will be profitable or who is to get the benefit of it after it is grown.

It must be remembered as a basic roposition in connection with this whole subject that there is no moral or legal obligation resting upon the farmer to feed any one but his own family. It seems to have been taken for granted that as a class the farmers were expected to in some way produce enough to feed the rest of mankind. No such obligation exists. But even if they did carry this responsibility, it can be shown from the government's own figures that if you compare the last ten years with an equal period 40 years ago, you will find that the farmer is producing more food in proportion to the population than he did then.

To compare the last two or three years with a like period farther back is an unjust comparison because of the wide variation both in climatic conditions and in amount of equipment. Cows are scarce now, why? Because no longer ago than in 1904 and 1905 dairymen, as here in Lancaster County, Pa., had to take, during certain months in the year, 20 and 21 cents a pound for butter fat. We could not begin to produce it for that, and as that same relative price held everywhere gradually cows were discarded and calves were slaughtered that should have been raised for breeders. At that time we heard no howl from anywhere about the low cost of living. The condition was allowed to go on until the destruction of the herds and the shifting to milk production equalized matters and the farmer has adjusted his dairying to a profitable basis. That's good business isn't it?

It can also be shown from the census reports that the American farmer has not impoverished his land, the statement of many of these uplifters to the contrary notwithstanding. The following table is taken from the census reports:

	Yield per acre in bushels. 1890-1900	Yield per acre in bushels. 1900-1910
Corn	24.56	25.79
Wheat	13.27	14.28
Oats	27.19	29.69
Rye	14.31	16.13
Barley	23.26	25.89
Buckwheat	16.87	19.06

There are no ten-year figures for potatoes, but by comparing the census of 1899 with 1909 we find that while the acreage has increased 24.8 percent, the bushels per acre have increased 42.4 percent.

The report of the House Committee to the House makes this statement: "To teach the farmers the best methods of increasing production is exceedingly important, but not more vitally so than is the importance of teaching him the best and most economical methods of distribution." Here is a great fallacy that our congressmen will not seem to recognize. With the exception of the truck farmer and the small fruit farmer, the American farmer is essentially a wholesaler. Even Mr. Lewis made this mistake in his Parcel Post argument, exhaustive as it was. The average farmer will not bother his head about distribution. That is a city problem and must be worked out by the cities. Some of these rural uplift organizations in our cities might well occupy themselves with this problem.

The dairy business was once almost entirely an individual and retail business, but now largely wholesale. The raising of cereals was once a community business between producer and consumer; now it is almost entirely a wholesale business, as far as the farmer is concerned. It is so with hay, potatoes, cattle, hogs, poultry, eggs, and largely with fruits. And while he is interested in abolishing unnecessary middlemen, all the experts in Christendom can not make a retailer of him.

If what has been brought out is true, then what kind of teachers do we need? We need expert farmers. We need men who in each community work out the methods suited to that particular locality. Those are the real teachers who have been leading the advance in farming. Neighbors copy from these men in every community. Instead of this we are offered farm experts, young men fresh from college with no experience; well versed in theory, but not knowing the essential variations between theory and practice. If this agricultural extension work is to amount to anything, in these older farming communities at least, it must be handled by men who have worked on farms for at least five years, not as managers of millionaire-fad farms, but where they are compelled to make good. If a man can show that he is an expert farmer, his fellows will readily take his advice; but if there is a suspicion that the person offering advice is not a practical expert farmer, they will take his counsel no more than would a manufacturer put a foreman over his men who did not understand the business in hand.—John A. McSparran, Lancaster Co., Pa.

Eighty Years of Faithful Service to the American Public

The Mitchell-Lewis Motor Company has the enviable record of *eighty years of faithful service to the American public.* Bear this in mind when you get ready to buy a car, for it operates as *insurance of quality.*

Eighty years of faithful service is an asset *of no uncertain value.* This company held the respect of the early settlers of the western country because of absolutely honest merchandise in the shape of farm wagons. It established its standing before automobiles were known. When it embarked in the automobile business, it clung to the policy that made its farm wagon business famous. And its automobiles are famous, *for the same satisfying reason.*

You've got something behind you when you buy. Our standing and prestige constitute a *bulwark of safety.* Add to this the remarkably fine character of the Mitchell Models and your purchase is *as solid as the Rock of Gibraltar.* Ask any farmer in America what he thinks of the old Mitchell-Lewis Wagon Company. Ask any one of thirty thousand Mitchell automobile owners what he thinks of the Mitchell-Lewis *Motor* Company. Their reputation and reliability are precisely the same.

The Mitchell Models for 1914:

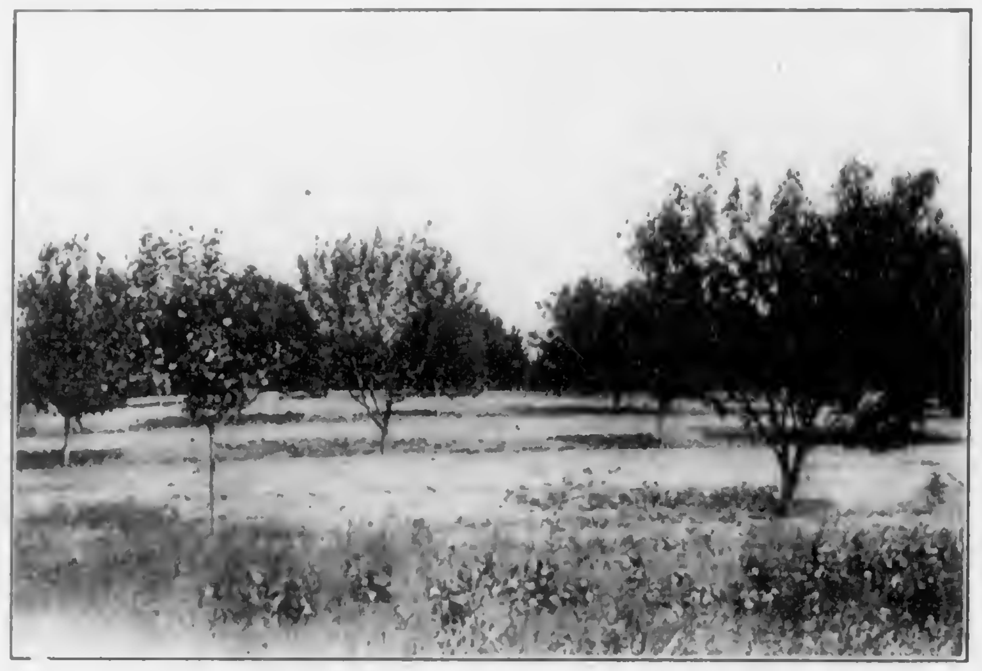
Horticulture

RUNNING A FRUIT FARM

Prof. F. C. Sears, Professor of Pomology, State College of Agriculture, Amherst, Mass., speaking at the New York State Fruit Growers' Convention on his six years' experience in running Bay Road Fruit Farm, at Amherst, Mass., "which" as he explains, "is an orchard started in 1908 by Prof. Waugh and myself and which now comprises about 125 acres" gives some interesting information.

Choice of Varieties

There is a better distribution of the labor required where one plants several varieties of any fruit and several different kinds of fruit. If he enlarges his list of varieties, and still more if he includes several classes of fruits in his plantings, his season of labor is very decidedly extended. In the matter of picking, for example, instead of having it all come in two weeks, the last of September and the first of October, his picking season extends from July to the middle of October, a very decided advantage. Another point which has influenced us in increasing our list of varieties somewhat and in planting other than the apple, is that it enables one to hold his customers better. For the grower who is catering to a personal market the ability to offer a choice of varieties is certainly worth considering.



A PEACH AND APPLE ORCHARD INTERCROPPED WITH ASPARAGUS. SET WHEN THE TREES WERE PLANTED. ORCHARD IS HEALTHY AND VIGOROUS.

Looking at the subject in this way, while we have made apples our leading fruit, we have also set peaches, plums and quinces, and we expect to add grapes and cherries. Our list of important varieties in apples is, in the order of ripening: Yellow Transparent, Red Astrachan, Oldenburg, Wealthy, McIntosh, Hubbardston, Sutton, Palmer Greening, Wagener, Rhode Island Greening, Baldwin. Of course, we have set many more of some of these than of others. Probably five-sixths of the plantings are made up of Baldwins, McIntosh, Wagener, Rhode Island Greening and Palmer Greening.

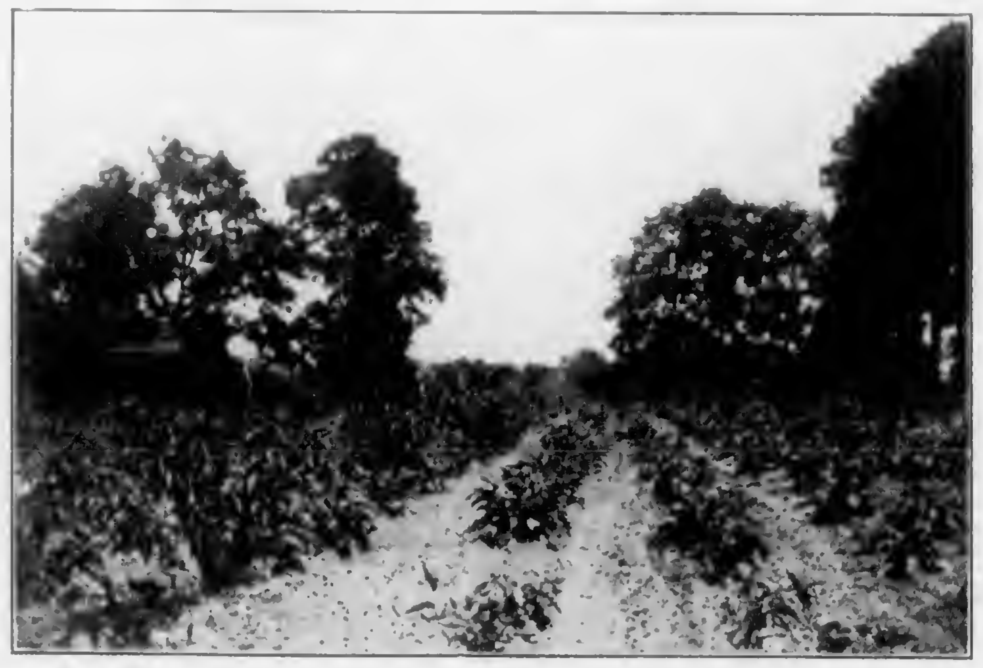
In peaches we have set Greensboro, Carman, Champion, Belle of Georgia, and Elberta. This gives a good succession altho not a perfect one. There are breaks in the line which we want to fill and in particular we need a variety that is later than Elberta.

Inter-crops for the Young Orchard

To be satisfactory a crop must first of all leave the trees in as good or better condition than they would have been without it, and second, it must be profitable to the owner. This is a difficult crop to get. At least we have found it so. To be satisfactory to the orchard the crop must require good cultivation, must not spread out so as to shade the trees or rob them of food, and it is very desirable that it should make its greatest growth at a different period from the trees. In order to be profitable to the owner it must be a crop which he can use to advantage on the farm or which he can sell for cash. We have not considered it advisable to go into truck crops and we are therefore restricted to general crops that can be sold for cash. Those which we found most satisfactory under our conditions are: Soy beans, corn, potatoes, cabbage, squash, and strawberries. Even strawberries we find objectionable in anything but very young orchards because they prevent cross-cultivation, and still further because they require to be kept on the land two years. It is impossible to keep the trees in as good condition where the land cannot be given thoro preparation in the spring.

Cover Crops In The Orchard

The most important offices of a cover crop are the following, arranged roughly in order of their importance: 1st, to add humus to the soil; 2nd, to prevent washing of the soil; 3rd, to check the growth of the trees; 4th, to add nitrogen to the soil. In addition to this, if the crop is to be used on an orchard of any size, and if the owner is not a millionaire, the seed must be reasonably cheap. At the present time the following are our most promising crops: Buckwheat, barley, dwarf Essex rape, turnips, soy beans, and rye. One great advantage of buckwheat is that it will grow almost anywhere and that it leaves the soil in fine condition; also that it tends to re-seed itself from year to year so that one saves on the bill for seed. One practice we have found helpful in getting a good growth of cover crops is to apply a little fertilizer when the cover crop is sown. In fact, we are even contemplating changing the time for applying our orchard fertilizers from early spring to the date at which the crop is sown, for, of course, in the long run, the trees get the plant food which is taken up temporarily by the cover-crop.



EGGPLANTS INTERCROPPED IN FIRST YEAR PEACH ORCHARD.

A point in favor of turnips and dwarf Essex rape is the low cost of seed. Two pounds will sow an acre and the former costs about 35 cents a pound while the latter can be bought for about 8 cents. Where one is sowing a large acreage this low cost of seed looks very attractive. A further advantage of turnips is, that under anything like favorable circumstances a good many of them will grow large enough to be marketable. One can then go thru the patch and pull out enough to more than pay for the cost of the crop and still have a good stand to act as a cover.

Orchard Implements

While we have a great many different implements, the three which we use the most are the light-draft orchard harrow, the California orchard plow and the orchard cultivator. The first mentioned is a light form of spring-tooth harrow, mounted on wheels, and will come nearer to doing all the work in the orchard in one day than anything else I have ever seen. Our teams have done as much as ten acres in a half day.

The California orchard plow consists of a gang of four disks at the end of a long beam and its strong point is that one can get close up to the trees with the plow and still keep the team well away. We have found it better than any plow we have yet tried. The orchard cultivator is an implement with rigid teeth and is especially useful where there is hard work to be performed; that is, where the soil is heavy or the weeds bad. Under such conditions the light-draft harrow will not work satisfactorily.

Spraying

We start in the spring with pruning and dormant spraying and this is followed by spraying our apples for codling moth. If we grew all peaches we should leave out this latter work. Then later on we spray our peaches with self-boiled lime-sulphur which comes at a time when there is little to do in the apple orchard. Then all of our low lands are seeded down to hay, a crop that lends itself admirably to the equitable distribution of labor because haying comes in just as we are thru spraying and is out of the way just in time to begin picking the earliest peaches.

Marketing

We have worked principally to develop a family trade in fruits and personally I believe that is by far the most valuable type. I had rather sell a man 5 barrels at $4.00 per barrel than two boxes at $2.50. On the other hand we must not over-look the fact that the less fruit one sells a customer at one time the more that customer is willing to pay. At two apples for five cents (a very reasonable price where one is buying a few apples to eat) a barrel of apples (estimated at 350 apples) will sell for $8.75. In particular I believe that if growers could persuade their grocery-men to handle the fruit on a commission, some form of small basket or carton would be very profitable. This plan not only gives the advantage of better prices to the grower, but it gives him a certain control over the price which is very desirable.—W. H. Jenkins, Delaware Co., N. Y.

INTERCROPPING ORCHARDS WITH TRUCK CROPS

Intercropping the young orchard of apple, peach or pear is really necessary where farmers own their land at high cost, and, in fact, intercropping with crops that are not exhaustive guarantees a certain amount of fertilizing and cultivation which a hard-pressed farmer might neglect in connection with land devoted to an orchard alone, which is necessarily slower of return.

In a young orchard the area between trees is not affected by young roots and a crop grown between them cannot rob the trees for the first two or three years, if not grown too close. Indeed, intercrops do not take all the fertilizer the farmer puts on them and some of this will benefit the trees as they grow. It is never wise, however, to use a succession of intercrops on an orchard in one season working the ground from early until late, as a market gardener would do. One large grower of apples and peaches who intercrops his young orchards lays down this rule: Never intercrop a bearing orchard with any crops that

Make Every Inch of Soil Produce the Maximum at Lowest Cost

IN ORDER to make your soil produce its maximum yield, you should supply a fertilizer "made to order" to meet your individual soil and crop conditions.

Consumers Brands for General Farm Use

comprise special distinct compositions of plant food elements for forage crops, root crops and cereals to meet just your individual soil and crop requirements. They supply just the constituents your particular soil may need for some special crop. You pay for no unnecessary plant food elements.

Early Crop Odorless Fertilizer

is prepared especially for the market garden trade for vegetables, small fruits, greenhouse and garden crops. It supplies the four plant food elements needed for these crops in soluble form, mixed in such proportions as to meet your particular soil and crop requirements. Although soluble, it is so prepared in granular form as to prevent leaching and wasting. It produces quick growth and early maturity, which means *bigger profits.*

Holden's Special Fertilizers

For Florists and Gardeners for Greenhouse Work

These fertilizers are prepared by men who have made a life study of greenhouse fertilization in such a manner as to furnish just the plant food elements which your compost lacks. For this reason you save the cost of such plant food elements as your particular soil or crop may not require.

Mak-Gro Odorless Plant Food

A clean, high grade, granular fertilizer for potted house plants, window boxes, flower beds, small fruits, lawns and general home garden use—**made for the amateur.** A splendid side line for florists operating their own stores.

Agricultural Chemical and Fertilizer Materials

We are prepared to furnish all high grade agricultural chemicals and fertilizer materials in any quantity. **We make a specialty of Genuine Thomas Phosphate Powder (Basic Slag).**

Planet Jr.

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. It is light, handy, and adapted to almost every garden use. Has leaf guard for close work, and a durable *steel* frame. Light enough for a woman to use.

The up-to-the-minute time and labor savers in field and garden. Planet Jr implements are the product of more than 40 years' experience of a practical farmer and manufacturer. Get them for scientific work and big results. $2 to $100.

FREE Our new 72-page illustrated catalogue contains valuable advice about tools for each kind of cultivation. Write postal today.

S L ALLEN & CO
Box 1202E Philadelphia

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. The plow opens furrows for manure, seed, etc., and can be reversed for covering. Crops can be worked both sides at once until 20 inches high. Steel frame. Just the tool for the onion-grower.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has automatic feed-stopper, seed index, and complete cultivating attachments. The hoes are of a special patented form which run close to row without danger to leaves or roots. Steel frame. Two acres a day can be easily worked with this tool.

No. 8 Planet Jr Horse Hoe and Cultivator

The best-known cultivating implement made. It is so strongly built that it withstands incredible strain, yet it is light and easy to handle. Has new steel wheel which prevents clogging with stones and other trash. Cultivates to any depth and adjusts to any width. Opens and closes furrow, and hoes right up to plants without danger of injuring them.

Fire-Fly Garden Plow

Especially useful to owners of small gardens, and to chicken-raisers for plowing up scratching yards. Its light weight makes it easy for women or children to use also. Enables the owner of a family garden to do all the work in spare minutes.

Potato Profits

A certain loss in potatoes has been turned into a profit of $30 an acre by more and better cultivation. Keeps the soil mellow, retains the moisture and kills the weeds.

IRON AGE Riding Cultivators

Carry every possible adjustment of points, gangs, wheels and frame to care for any row crops in any soil and especially for potatoes.

All steel but pole and neckyoke.

Built for wear and convenience.

See them at your dealers and write us for booklet on "Two-Horse Riding and Walking Cultivators."

Ask also for Iron Age Farm and Garden News.

demand cultivation later than August 1st, as later cultivation tends to make the trees grow new wood instead of perfecting the fruit buds for next year's crop. Peas, beans, watermelons, cantaloupes and early tomatoes are safe crops to employ for this purpose. Young orchards not yet bearing may be hurt by late stimulation of young growth which cannot harden before winter and therefore winter kills.

When the trees get large intercropping may have little advantage, for either it will rob the trees of moisture, especially in bearing years, or the trees will rob the crop.—M. Robert Conover, Monmouth County, N. J.

PREPARING FOR TRUCK CROPS

Mr. H. F. Thompson, a successful truck farmer of Massachusetts says that the aim of the trucker is to grow good crops and to grow them quickly and that herein lies his profit. He urges the use of more lime, or rather a return to the use of lime, to sweeten acid soils. He does not approve the use of burnt lime, but of ground limestone or of ground oyster shells, believing it impossible to raise alfalfa, clover or crimson clover on acid soil otherwise.

To get needed nitrogen and organic matter in the soil to hold the moisture, plowing under cover crops and using stable manure is advocated. Crimson clover as a cover crop is to be preferred, planting in the early fall and turning under in the spring; if this is winter killed, vetch is the next best and rye the last resort. Crimson clover takes from the air 100 pounds of nitrogen to the acre and fixes it in the soil; the market value of nitrogen in commercial fertilizers is 20 cents a pound.

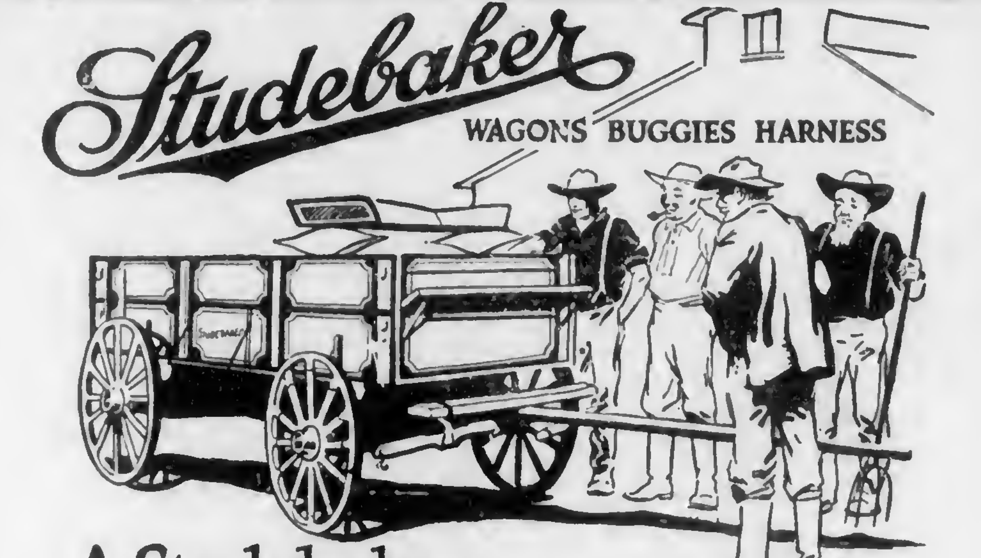
Stable manure, declares Mr. Thompson, is the best of fertilizers and is worth about $2.75 a ton, containing at the price paid for plant food in the commercial fertilizer, $2.75 worth of nitrogen, phosphate and potash; but it is ahead of the commercial fertilizer in that it furnishes humus for the soil holds the moisture, and decomposes more rapidly, having with it the bacteria needed to furnish plant food for the plant roots. A farmer can afford to sell anything else on his farm, but he cannot afford to sell an ounce of stable manure according to this grower, and he can, on the other hand, afford to buy it. He should keep his manure carefully, and not throw it out in a heap, and allow it to heat or leach out.

Mr. Thompson shows that commercial fertilizer has its base in Chilean nitrates, Florida or Carolina phosphate rocks, and German kainit or sodas. Others are made from ground bone, dried fish, dried blood, and ground hoofs, horns and leather. He recommends all except the last. Mr. Thompson states that one farmers' exchange in New Jersey bought $140,000 worth of commercial fertilizer in one year.—D. T. Hendrickson, Monmouth County, N. J.

CONTROL OF A FEW INSECT DISEASES

Dr. T. J. Headlee, State Entomologist of New Jersey, believes that farmers can guard against white grubs, wire worms and cut worms, which attack the potato tuber, by a proper rotation of crops. These pests tend to collect in grass lands. The flea beetle is one of the most injurious enemies of the potato plant. In the worst cases, to get rid of the pest, he advises putting Bordeaux mixture on in such a way that it will reach the lower as well as the upper part of the leaf.

Among the insects which affect the peach are the plum curculio and peach tree borer. The first may be taken care of in the course of the regular spraying schedule, beginning to spray at the time the petals drop and keeping the peach fruit covered with a poison for a month or six weeks after the petals drop. The peach tree borer worms into the trees. In California they have successfully used a coating of asphaltum applied warm with a brush to the trees as a protection against this disease. This is put on in the spring. Apple trees attacked by codling moth and plum curculio. Fifty percent of the apples knocked down before ripening are due to the latter. Dr. Headlee recommends a regular spraying schedule, the first at the cluster cup stage, the second when the blossoms fall, the third ten days after the blossoms fall, giving fruit and foliage a careful coating; the fourth three weeks after the blossoms drop, and the fifth and last spraying for late fall and winter varieties, ten weeks after the blossoms fall.—D. T.



Studebaker
WAGONS BUGGIES HARNESS

A Studebaker that served 4 masters in 49 years and still on the job

NEARLY half a century of usefulness is the life history of a Studebaker farm wagon, at present owned by Levi Dallas of Topeka, Ind. A letter received by Studebaker states:

"I bought a Studebaker wagon in July, 1864 from Mr. Walsh, your dealer at that time at Goshen, Ind. I had the wagon eight or ten years, then sold it to a neighbor, John S. Yoder. The wagon was then sold to Thomas Cullet. When Mr. Cullet died the wagon was sold to Levi Dallas who lives two miles east of Topeka, who now owns the wagon and who is using it right along."

THIS IS CONCLUSIVE PROOF

It is economy to buy a Studebaker Wagon. Suppose the wagon now owned by Mr. Dallas which was purchased in 1864—cost at that time $110.00—divide the amount into 49 years—the wagon has cost $2.24 per year—and every year it continues to give service it reduces the cost per year.

If some other make of wagon had been purchased at a cost of $90.00 and that wagon had lasted the usual life of such a wagon—ten years—or to be liberal let us say 20 years—divide the cost into 20 years—that wagon would have cost $4.50 per year, or twice as much as the Studebaker wagon, even though the Studebaker cost $20.00 more at the time of purchase.

The same thing holds good today. Don't let a dealer sell you a wagon "just as good" as a Studebaker, even if you could buy it for $25.00 less.

Studebaker has been building wagons for over sixty years and there are thousands and thousands of farmers all over the country who are using Studebaker Wagons today that were purchased anywhere from 35 to 50 years ago.

And remember, Studebaker Buggies and Harness are just as reliable as Studebaker Wagons.

Poultry

SPROUTING OATS IN QUANTITIES

Sprouted oats has become a great favorite as a green food with poultrymen, many using it entirely. It is very easy to raise as it can be grown successfully in almost any place where the temperature can be kept in the neighborhood of sixty degrees. However, to grow it in quantities, and to be sure of a constant supply, as is necessary on poultry farms, it is needful to have an especially arranged place. The accompanying photograph shows a small hot house now being very successfully used for that purpose by a large poultry farm in Chester County, Pennsylvania. The walls of this house (a lean-to) are of concrete and the frame of iron and wood construction, such as can be purchased in various sizes from any green house builder.

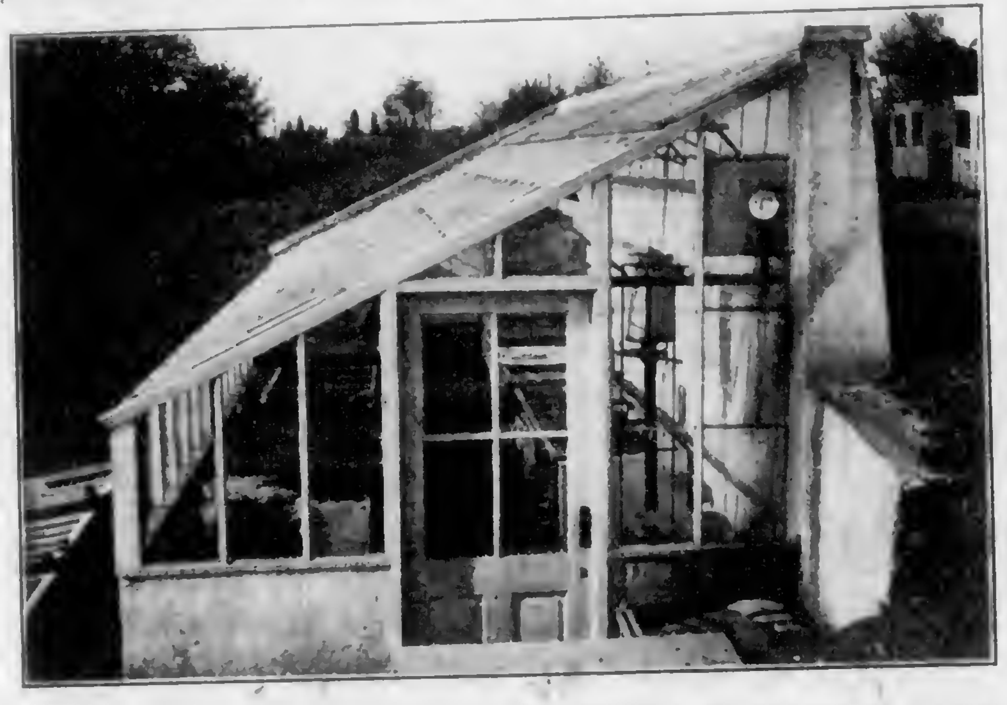
This house has an interior measurement of ten feet wide by thirty feet in length. Along the back and front wall are arranged frame works of angle iron one inch in width bolted together and so arranged as to form slides for wooden drawers. These drawers are two and a half feet square and four inches deep with wire bottoms of the smallest mesh cellar window wire. To keep the wire from tearing off and to make a smooth surface, so as to facilitate the sliding of the drawers in and out, half-inch strips are nailed on top of the wire around the edge of the bottom of the trays where they come in contact with the angle iron slides. It is also best to place one such strip across the center of the wire bottom to help support it and to use as heavy a guage wire as can be obtained. The iron frame work and wire bottom trays are to be preferred to the wooden frame and wood or burlap bottom trays, as with the former there is no trouble of any account with mould, but with the latter such trouble is very common; and nothing will cause more disorders and deaths in poultry than mouldy feed. The slides for the drawers are six inches apart leaving a space of an inch between the drawers. They are placed this close together to keep in the moisture and as far as possible to prevent the air from passing over the oats when first spread out in the drawers and drying it out. The back of the frame work is covered with galvanized iron for the same purpose and sheets of this material are provided to lay across the top when the oats is first placed in the trays, these sheets being removed after growth commences.

The house is heated with hot water heat, the pipes for which pass in back of the galvanized iron on the frame work. There is a passage way of four feet between the front and back row of trays to allow for tending and obtaining with least trouble the oats for feeding. The trays are placed five in height, which is about the height of the average hot house bench. Thus if a table were placed on top of the frame work the house would answer a two-fold purpose. The floor is composed of cinders two feet deep so as to give quick drainage of the water dropping from the drawers when the oats are sprinkled. Four supports 4 by 6, (four-inch side up) two on each side, are placed in the cinders, to which the legs of the frame work for the trays are fastened.

The oats are first soaked in a tub of warm water for about 8 hours. Less soaking than this will cause poor sprouting, while more than half a day will do the same. After the soaking it is dumped into a half barrel which has a perforated bottom to allow the water to drain off. The barrel is then covered with a sack and the oats allowed to remain there, being sprinkled with warm water and turned over with a fork night and morning, until small hair-like roots are noticed shooting out of the oats, at which time they are ready for the trays. In these they are spread out to about an inch or two thick. The set of trays when first started should be kept well protected from the sun and air, which will dry the oats out, thus ruining the germinating qualities. When the shoots have grown about an inch long the trays should be exposed to the sun and air so as to make them green and cause them to grow longer. To do this every other tray should be removed, thus giving the desired space. If the trays are not separated the oats will eventually grow up filling all the space, then heat and burn, making it unfit for use. During growth the oats should be sprinkled night and morning with warm water. Never use hot water for that will scald the oats and kill them. It is unnecessary to turn the oats after it has been placed in the trays. In fact I have found that it does much better if left undisturbed, altho this is contrary to popular practice.

The oats is usually ready for feeding in about ten days, when it is from 4 to 6 inches high. The best way to feed it is to break the oats up in to chunks about the size of a brick and feed on the floor of the house or in the yard once a day, giving one tray to every 300 or 400 hens. It should not be torn up in small pieces, for, in this way the hens will most likely swallow it in such chunks as to cause a crop bound condition which can not happen with the large pieces because the hens pulling it apart themselves only get one or two grains at a time.

Perhaps it would be well to add in closing that oats should not be sprinkled the day it is to be fed and under no circumstances should mouldy oats be fed. To keep down the mould the trays and tubs in use should be scrubbed frequently with scalding water and exposed to the sun. If this is done and your frame and trays are constructed so far as possible of metal you will have but little trouble with bad oats.—J. Raymond Kessler, Chester Co., Pa.



SMALL GREENHOUSE FOR SPROUTING OATS FOR POULTRY ON WEIGHTMAN POULTRY FARM, CHESTER COUNTY, PA.

Nursery Stock.—The Maple Bend Nursery Catalog is one of the most business like that has come to our attention this season. It gives descriptions of stock, prices and hints on growing in condensed, direct statements which tell you just what you want to know. It is sent free upon request to T. B. West, Lock Box 137, Perry, O.

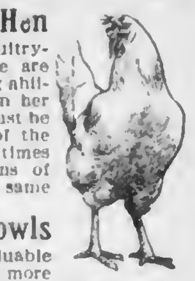
Dollars For You 14 varieties, land and water fowls. 200 egg strain. Send 2c stamp for catalog. Maple Cove Farm, Rt. 21, Athens, Pa.



Listen to the Cackling Hen
It's a welcome sound to the poultry-keeper. But all hens that cackle are not profitable layers. The laying ability of a hen depends largely upon her anatomical construction. She must be of the "laying type" regardless of the breed. Some hens will lay four times as many eggs per year as other hens of the same breed under exactly the same care and feed.
Keep Only Profitable Fowls
"The Call of the Hen" is a valuable book for every poultry raiser. It is more than a book—it's practically a course of instruction in scientifically selecting and intelligently breeding fowls. Mr. Walter Hogan—the author—gives in this book the results of half a century of careful experimenting in selecting and breeding for heavy egg production. His discoveries show that in every breed there are three distinct types of fowls—the meat, the dual purpose, and the laying type.
"The Call of the Hen" shows you how to pick each profitable layer from the rest of the flock—how to pick for breeders those that will reproduce their laying ability in their progeny.
Send To-Day For This Valuable Book
Mr. Hogan's article on "Prepotency" is alone worth many times the price, $2.00, of "The Call of the Hen." He has absolute proofs that "Prepotency" is the vital factor in breeding and his work verifies his methods and discoveries. Send $2.00 to-day—this is a straight cash offer—no premiums or other inducements—the book will prove in itself the biggest value you ever received.
The Poultry Item, Box P, Sellersville, Pa.

The Dairy

HOW TO DETERMINE DAIRY TYPE IN COWS

(Excerpts from a Lecture by Hugh G. Van Pelt, of Iowa.)

There are five essential points that must be present and well developed in the external form of a cow if she proves herself a profitable producer of milk and butterfat under present conditions. These are the indications of constitution, capacity, nervous temperament, blood circulation and ability. Therefore in selecting and breeding cows it must be borne in mind that, as important as any four of the essential points may be, they are to a great degree worthless unless accompanied by the fifth.

To avoid confusion and the overlooking of one or more of the significant features of development or the lack of it in any part, it is well to acquire a systematic method of examining the animal. It is always advisable to take in the general appearance of the animal first, for in many instances this is all that is necessary. To the experienced eye the first impression shows it to be faulty in one or more of the essential qualities. This first impression is always gained with greatest accuracy from a reasonable distance while the animal is standing or walking broadside to the observer.

The comparative width across the hips and length in the rump is usually apparent enough so it may be determined by the eye rather than by measurement with the arms, altho in cases where animals are nearly the same in these parts the latter procedure is sometimes advisable. The examination of the mammary system should now take place and if possible should be made in detail by the use of both the senses of sight and touch for many are the indications of ability that escape the eye, and as a rule enough mistakes occur where both faculties are put to work. In completing the examination of a cow it is always advisable to milk or see some one else milk her in order to determine certainly that there are no defects that are not apparent when the udder is full. Many a man has purchased a cow and never discovered her worthlessness in one of more quarters of her udder until she has been paid for and no recourse remained.

Strength of constitution depends primarily upon the amount of pure fresh air that enters the body and the manner in which it is utilized by the lungs in purifying the blood. Quite as important as an indication of vigorous constitution is the size and capacity of the thorax or the chamber in which the heart and lungs are located. Smallness or lack of development in this part of the body prohibit greatness of heart and lung development, resulting in limited stamina, vigor and ruggedness. To insure ample room for the fullest growth of the heart and lungs the cow should be extremely deep from the top of the shoulder to the floor of the chest, fairly broad in the chest, deep in the region of the heart girth and well sprung in the fore rib.

It may be said that usually the cow with eyes that are bright and clear, and horns that are rather heavy at the base and tapering gradually to a point, is more vigorous than the one with the dull sunken eyes and horns that are almost as small at their base as near the point.

The capacity of the dairy cow refers to the total amount of food she can consume and digest in a given time without injuring her future usefulness. It depends upon the size and strength of her organs of mastication and digestion. Capacious cows are always more ravenous feeders than cows lacking in the development of this characteristic and for this reason less difficult to feed. Feeders of all classes of farm animals realize that the animal with the large mouth is a good feeder; that this qualification has come to be one of the recognized indications of capacity. The animal with a small pointed mouth and a small muzzle is always difficult to feed, being dainty and indifferent to the efforts of the feeder to tempt its appetite.

Great milk production points to the significance of an adequate and roomy space where the foods may be stored and digestion carried on. This entails a large barrel, one that is long, broad and deep. These specifications are insured by length from the shoulder to the hip bone, broad, flat, well-sprung, deep ribs. On the other hand, it often occurs that close-coupled cows, those with short bodies that are broad and deep, are excellent feeders and good producers, and if there is to be any sacrifice made in the dimensions of the barrel it is better that length rather than any of the other proportions be overlooked.

The condition and efficiency of the organs of digestion may be determined by the handling qualities of the animal. By carefully lifting the hide from the body there is at once conveyed to the touch one of two sets of conditions; either the hide is soft, pliable and elastic and the hair covering it soft and silky, or the hide is hard, stiff and so tightly drawn over the body that it is impossible to lift it away from the ribs. Such hide is usually covered with hair that is coarse, harsh and wiry, standing out from the body rather than lying smoothly. When the former condition exists, not only quality of all parts of the body is indicated but an efficient digestive tract is also assured. The animal will consume its food, digest it quickly and be ready for more. But when the hide is covered with harsh, wiry hair there is something wrong with the digestive appartus, either temporarily or permanently, and even tho the animal is a gross feeder the best use will not be made of the food.

The term nervous temperament used in referring to the disposition of the cow means the inherent propensity to work, to eat food, digest it and convert every available ounce of it not required for maintenance into milk products. Nervous temperament does not imply that the cow is nervous in the generally accepted meaning of the term, nor does it mean that she is excitable, fretful or hard to manage; but that she is especially strong in the development of the nervous system. It naturally follows that such an animal is always alert, active and responds readily to all surroundings whether they be favorable or adverse.

It is this nervous temperament that enables the dairy cow to endure for a long period greater work than her form, appearance and size would indicate. It is the quality that gives the Arabian horse the endurance which enables him to make long journeys with little food and water. The same characteristic is termed stamina when found in the horse bred for speed. In the dairy cow this trait stimulates the function of milk making. Temperament is always reflected in the eye of an animal. A large, bright, prominent, placid, alert eye with an intelligent expression gives assurance of nervous temperament as represented by these parts.

Prominent hips and ribs that are apparent to the eye and freedom from breefiness or superfluous fat over the entire body are all important indications, for they denote that the nervous temperament has stimulated the conversion of the food into milk and butter fat rather than into beef, which would be the case if the animal was endowed with a phlygmatic temperament. Add to these points style, activity and freedom of carriage, alertness and consciousness of all surroundings and you may guarantee that the cow possessing these is a worker.

The volume of blood which circulates past the digestive apparatus and, in turn, thru the udder or milk-making factory has much to do with the amount of milk and butterfat produced. The volume of circulating blood and the direction in which it flows are indicated by the escutcheon, mammary veins and milk wells. The escutcheon that is long and wide, extending down over a portion of the udder, is an indication of a large amount of blood passing into the udder, taking with it large amounts of nutrients.

Invariably the greater the development of the mammary veins designated by their length, size and tortuousness, the larger and more numerous the milk wells, the more productive the cow. Veins range in size from that of a man's thumb to those only large enough for the insertion of the small finger. These features point to the fact that a wonderful volume of blood has passed thru the udder.

Ability, used in describing the cow, refers to her powers of performing her required function of milk giving. Altho ability is synonymous with capacity the difference in meaning is great enough to justify their use in differentiating between the cow's receptiveness for food and her power for manufacturing the nutrient from the food into milk products. Size, form and texture of udder development are the principal indications. Size should be sought in length and breadth of udder rather than in depth, for several reasons. Largeness of udder gained by depth results in a pendent udder, one that hangs from the body and dangles or swings between the legs. Such udders are disagreeable to milk.

Of all forms of the udder the most desirable is the one symmetrical and uniform in the development of each portion. Each quarter and half should correspond with the other, and be so closely connected as to make the juncture almost invisible. With size added to the udder of this form there is ample room for the placement of four easily milked teats of medium size set far apart, one for each quarter. As for the true length of udder, the best indication is the length from the hip bone to the pin bones. When the cow is fresh and her udder is full, a plumb bob ropped downward from the point of the ip bone falls immediately in front of the udder. Consequently, if the length from the hip bones to the pin bone is great, the length of the udder will be correspondingly great. Even tho in certain individuals that droop at the rump the udder is not very perceptibly faulty it may be taken as a rule that if offspring are continuously bred from animals of this conformation the associated characteristics will in time follow.—J.

EXAMINATION OF CATTLE FOR INTERSTATE SHIPMENT

"Under what conditions can I ship milk cows or heifers from New York to Pennsylvania? Would they have to be tested by a New York veterinary or a Pennsylvania veterinary, or both? C. A. G., Brockton, N. Y."

All cattle over six months old, except for immediate slaughter going from New York to Pennsylvania or vice versa, must be subjected to a physical examination and a tuberculin test by a qualified and licensed veterinarian. He may reside in Pennsylvania or New York. Before his examination and test can be accepted his honesty and reliability must be certified by J. G. Wills, State Veterinarian, Albany, N. Y., or C. J. Marshall, State Veterinarian, Harrisburg, Pa.

The examination and test must have been made within a few days previous to shipment and must show that each animal is free from tuberculosis. Special arrangements may be made for a permit to bring cattle into Pennsylvania and have them tested and examined by communicating with the State Veterinarian of Pennsylvania, before the cattle are shipped. A record of the examination and tuberculin test or the permit must accompany the cattle in transit. A copy of the examination and test must be sent to the State Veterinarian at Harrisburg within one week after the cattle are received in Pennsylvania and the duplicate sent to the State Veterinarian of New York. —M.

VALUE OF DETAILS

Many farmers have entered the dairy business with fascinating hopes and lively expectations and later found an ending with disappointment and failure. The reasons assigned for the failure are as various as the men who give them, but nine times out of ten the thing that directly contributes to the failure is a waning interest in attending to the minor things that go with the management of the herd.

Nothing contributes more to the health and productivity of dairy cows and young things than daily attention to their needs. The spasmodic enthusiast who feeds and cares for his cattle according to his immediate impulse is seldom a successful dairyman. Good care can not be handed out in big packages. The animal which is comfortable, without thirst or hunger from day to day, and not subjected to debilitating influences, maintains a healthy, steady advance in growth, flesh and milk production. Every day or week of neglect is followed by stagnation of nutritive processes and the loss of flesh condition and milk yields. In a hundred ways the income from the dairy may be lost by the man who is too busy here and there to attend to all the details. The dairyman can never shake off responsibility; his uniform management every day alike, measures his success.—W. K.

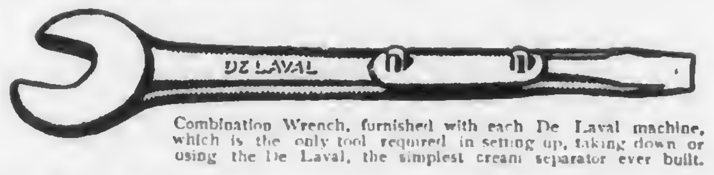
The Simplest CREAM SEPARATOR Ever Built —

DE LAVAL

EXCELS ALL OTHERS not only in thoroughness of separation, sanitary cleanliness, ease of running and durability, but as well in its great simplicity.

THERE IS NOTHING ABOUT THE OPERATION, cleaning, adjustment or repair of a modern De Laval which requires expert knowledge or special tools.

NOR ARE THERE ANY PARTS WHICH REQUIRE frequent adjustment in order to maintain good running or to conform to varying conditions in the every day use of a cream separator.



Combination Wrench, furnished with each De Laval machine, which is the only tool required in setting up, taking down or using the De Laval, the simplest cream separator ever built.

THERE IS NOTHING ABOUT THE MACHINE THAT cannot be taken apart, removed or replaced by any one who can use a wrench or screw driver. In fact, the only tool which is needed in the use or the operation of a De Laval Cream Separator is the combination wrench and screw driver illustrated above, which is furnished free with every machine.

Away With Churns!

Use the "Fayway"—Get More and Better Butter Stop Old-Fashioned, Wasteful Churning!

$1.00 Brings It

This marvelous machine is NOT A CHURN—it's a BUTTER MAKER! Does the work in half the time of the best churn. Gets MORE butter and BETTER butter from the *same cream* than by any other known process. The greatest MONEY MAKER for farmers and dairymen ever introduced. Makes your butter *bring more per pound!*

Revolutionizes Butter Making!

Fayway TRADE MARK **Butter Separator**

The "Fayway" System produces butter by an entirely different process—no "whipping" or "beating" with paddles or blades. *A stream of air blows the billions of butter globules to the top*—gets ALL the butter-fat!

Made in 3 Sizes

How It Works Just pour in the cream, turn the crank a few minutes and—*presto!*—there's the *butter!* Actually *fun* to make butter with the "Fayway"—all drudgery *abolished!*

Amazing Results

"Fayway" butter has a beautiful waxy texture. Tastes better, keeps longer, brings 5c to 10c more per pound than ordinary "churned" butter, and you get more of it.

Our $1.00 Deposit Trial Offer

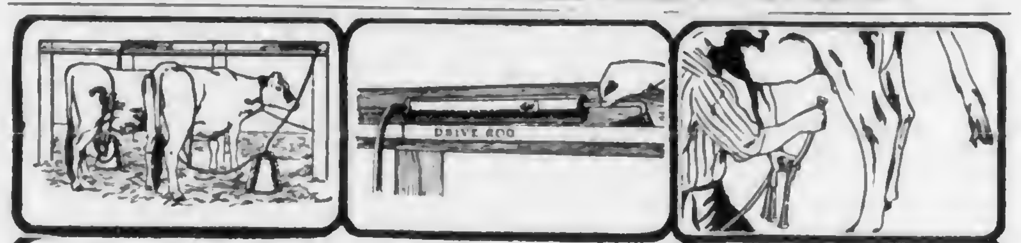
We don't ask you to take our word. We want you to SEE with your own EYES how the "Fayway" makes butter. Send for our $1.00 Deposit Plan on which we will ship this amazing machine for a free trial in your own home. If it doesn't do exactly what we claim, back comes your dollar!

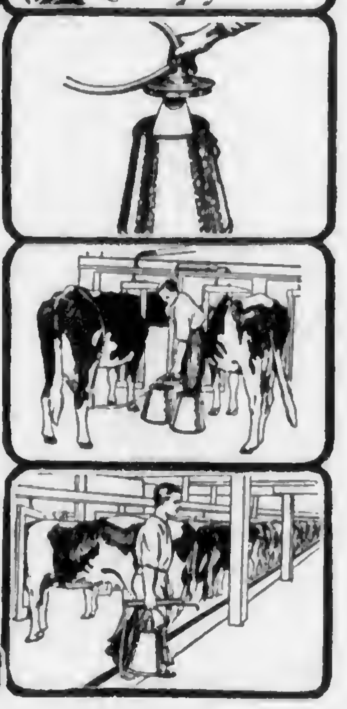
Don't send any money, but

Write for Free "Fayway" Book

This book tells all about the FAYWAY—the greatest invention since the cream separator was brought out. Let us tell you about Fayway Butter Clubs.

THE BLANTON & McKAY CO., 437 Carr Street, Cincinnati, Ohio





A one-minute change
—and the HINMAN MILKER is at work again

The operator is weighing and recording each cow's milk. No time is lost changing and adjusting the machine. It's so simple—light—and easily handled. The operator is milking from 20 to 25 cows per hour and doing a thorough job. Nothing to watch and worry about—just the simple, silent, steady operation from start to finish—and the work is done.

Moving the HINMAN

An Hour's Recreation To Milk 25 Cows with the Hinman

Watch the Hinman operate and draw your own conclusions. An outfit is near you—investigate. The HINMAN is original. It meets all requirements of any dairyman.

It is the only milker using a drive rod; rapid-pail-changing idea; separate machines; valve chamber—no vacuum in pail. It takes care of itself.

Let the HINMAN help you to get more money out of your dairy. 65,000 cows milked daily. Agents everywhere.

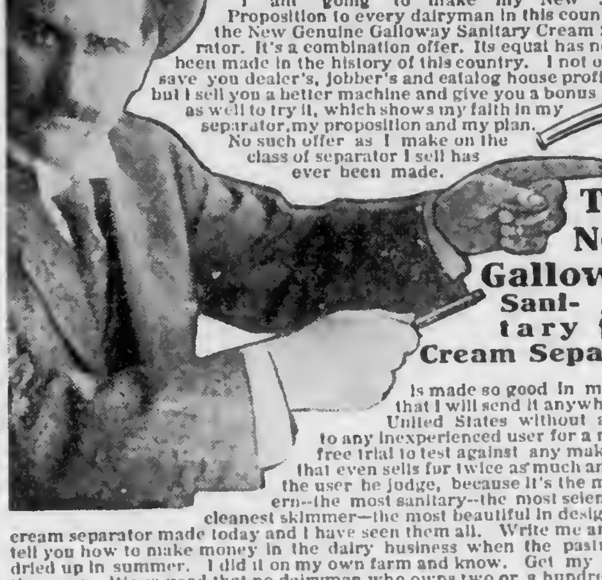
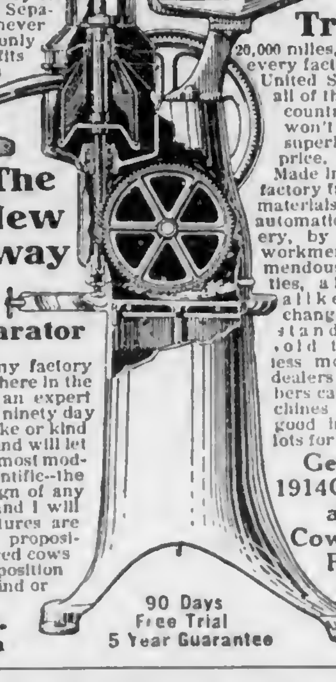
LISTEN! Read This Twice



For five months starting February first I am going to make my New Special Proposition to every dairyman in this country on the New Genuine Galloway Sanitary Cream Separator. It's a combination offer. Its equal has never been made in the history of this country. I not only save you dealer's, jobber's and catalog house profits but I sell you a better machine and give you a bonus as well to try it, which shows my faith in my separator, my proposition and my plan. No such offer as I make on the class of separator I sell has ever been made.



The New Galloway Sanitary Cream Separator

is made so good in my factory that I will send it anywhere in the United States without an expert to any inexperienced user for a ninety day free trial to test against any make or kind that even sells for twice as much and will let the user be judge, because it's the most modern—the most sanitary—the most scientific—the cleanest skimmer—the most beautiful in design of any cream separator made today and I have seen them all. Write me and I will tell you how to make money in the dairy business when the pastures are dried up in summer. I did it on my own farm and know. Get my proposition now. It's so good that no dairyman who owns two or a hundred cows can afford to be without it. All I ask you to do is to first get my proposition before you decide to purchase any cream separator of any make, kind or at any price. Just drop me a postal. Address

Travel 20,000 miles, look over every factory in the United States and all of the foreign countries—you won't find its superior at any price.

Made in our own factory from finest materials on best automatic machinery, by skilled workmen, in tremendous quantities, all parts alike, interchangeable, and standard and sold to you for less money than dealers and jobbers can buy machines not as good in carload lots for spot cash.

County Demonstrators A number of counties of the East have had a year or more of experience with the county agent or demonstrator service. If the Lever bill becomes a law, as now seems probable, this service will be greatly extended in the next few years. Enough work has already been done to make possible a few general conclusions as to the practical value of the plan and indicate some of the possibilities in its future extension. It is a well known fact that a considerable number of farmers have little confidence in the county agent plan. The article on page 3 of this issue presents the views of a leading farmer of this state on the service. We believe that he presents the views of quite a proportion of our farmers and his objections carry weight which must be taken into consideration by the agents and the institutions back of them. It is perfectly natural that there should be objection to the plan and even some prejudice against it until all may become acquainted with the real purposes of the work and the agents have had an opportunity to prove themselves. But it is significant that objection has been greatly reduced and in most cases entirely removed in those counties that have had a trial of the agent plan, and in many counties the previous prejudice has turned to enthusiasm in favor of the work. A feature, however, which should be particularly significant to the men and institutions having the work in charge is that the counties that have seemed to profit most and are in heartiest support of their agents have taken up their work on lines that include more than mere production methods. It is an easy matter to present figures to show that crop yields and acreage production might and should be increased. But the practical minded farmer must be shown how such increase in production is going to increase profits before there will be any enthusiastic response to demands for improved methods. The teachers and the statisticians may know that better methods mean larger returns with less labor and less acreage, but they must demonstrate the fact before there will be any considerable following of their counsel. The easier and more logical way is thru organization work looking to the elimination of waste and leaks and the return to the farmer of a larger net profit on the things he has to sell. The farmer has long known that he is at a disadvantage thru lack of organized effort. He has sought for a remedy but has lacked the organization and the leadership necessary to find or provide a way. The county agent plan provides a leader, and if he is of the proper caliber and is so inclined, he can provide the organization. When he has assisted in bringing to his patrons a larger relative return for the things they raise, he will have less difficulty in inaugurating better systems of production. Much of the success of the county agent system will depend upon the agent's ability to "size up" the needs of his county as a whole and direct his attention towards meeting those needs. The South undoubtedly needs specialization on production methods. Certain counties in every state in the East and North need it; but in every case the first need is organization for effective local work in the things which will be of the greatest value to the county as a whole. The agents themselves must appreciate this fact and the state and federal institutions behind them must recognize it. This means that these institutions must give greater attention to economic lines than they have in the past, and be prepared to back up their agents in organization work as well as in research and scientific work. It must be expected that there will be some mistakes and some failures. The field is an entirely new one, and there are no precedents to be followed; but the progress made by a few counties in a few months under the county agent plan shows possibilities of the service which are worthy of support.

Parcel Post Endangered The express companies, thru friends in Congress, are still stubbornly fighting parcel post. The Senate committee on post offices, in its revision of the post office appropriation bill, reported February 13, proposes to take from the Postmaster General the right to change rates and limits of weight for parcel post service. Members of the committee charge that the recent decrease in rates and increases in weight limits are causing a deficit in postal revenues which will have to be met out of general funds, and that the power of fixing weight limits and rates should rest with Congress. The Postmaster General replies that the recent changes have resulted in increased revenues, and that the parcel post service is now self-supporting. These are the assertions on both sides. To anyone knowing of the long fight that was waged against parcel post by the express companies and their "friends" in Congress, it is readily apparent that the question of cost of the parcel service is of minor importance in this controversy. The recent advance in weight limit from 20 to 50 pounds made the postal service a very serious competitor of the express companies, and the apparent preference of the public for the postal service has renewed the efforts to curtail further expansion. The change in the administration of the law proposed by the Senate committee would benefit no one but the express companies. There could be no mistaking of motives in such a change, and the public should not hesitate to express its emphatic disapproval of any interference with the complete development of the parcel post. The service was delayed long after other countries were enjoying its advantages. Now that it has finally been established and we have a Postmaster General who shows a genuine desire to make it of maximum value, the congressional members should be made to understand that they must keep hands off.

Farm Animals Statistics on numbers and value of farm animals on farms and ranges on January 1, 1914, recently issued by the U. S. Department of Agriculture, are interesting as showing the trend of farm live stock population in the past four years. They show a steady decrease in meat animals, the heaviest decline being in beef cattle. Compared with January 1, 1911, horses have increased in numbers 685,000 and in total value, $31,657,000. The average price of horses has declined $2.14 in the past four years but the increased numbers raise their aggregate value. Milk cows show comparatively little change in numbers in the four-year period, there being 20,737,000 head on January 1, 1914, as compared with 20,823,000, on January 1, 1911, a decrease of 86,000 head. The average price per head, however, has increased from $39.97 in 1911 to $53.94 in 1914, making an increase per head of $13.97, and an increase in aggregate value of $286,278,000. Cattle classed as other than dairy cows decreased 3,824,000 head in the four-year period. The average price per head increased $10.59, making an increase in aggregate value of $301,119,000. Sheep and swine are the two classes that have decreased both in number and value. Sheep showed a decline of 3,914,000 head in the four years; an increase of only 13 cents in average price per head, making a decrease in aggregate value of $8,732,000. Swine decreased 6,687,000 head; average price per head advanced $1.03, making a decline of $2,219,000 in aggregate value.

PENNSYLVANIA WINNINGS AT NATIONAL CORN SHOW

The National Corn Show now open in Dallas, Tex., is the most extensive in scope and variety of any yet held, and the quality is fully up to that of last year. The show is comfortably housed in the substantial permanent buildings of the Texas State Fair Grounds. Eastern entries are making a very favorable showing. The Pennsylvania exhibit is in charge of Prof. Frank D. Gardner, of State College. The state exhibit was late in arriving and had to be rushed to get it installed. It is also lacking in a number of entries for which premiums had been offered. The management did not get the premium list from the presses until the opening day of the exposition, and states were not fully advised as to premiums to be offered.

Leading Awards

Judging began February 9, and was still in progress at the date of mailing this report. National Sweepstakes for best 10 ears of any kind of corn was won by Indiana and National Sweepstakes Single Ear was won by Illinois. Eastern Zone and Pennsylvania winnings were as follows:

Eastern Zone

Grand Championship.—10 Ears Any Corn.—A. B. Twining, Forest Hill, Md. Grand Champion Ear, A. B. Twining. Yellow Dent, Single Ear—A. B. Twining. White Dent, Single Ear—B. W. Buckman, Wrightstown, Pa. Other Dent, Single Ear—Harry B. Herr, Lancaster, Pa. Flint, Single Ear.—Harry Rockwell, Canton, Pa.

Sweepstakes, 10-Ears: Yellow Dent—Jesse L. Eisiminger, Waynesburg, Pa. White Dent—A. B. Twining, Md. Other Dent—Harry B. Herr. Flint—J. J. Sheehan, Canton, N. Y.

Pennsylvania

Ten Ears Yellow Dent.—1st. Jessie L. Eisiminger; 2nd. Burton Bayard, Waynesburg; 3rd. Leasure Eisiminger, Waynesburg.

Ten Ears White Dent.—1st. Benjamin Harris, Newtown; 2nd. Dr. Vallie Hawkins, Fawn Grove; 3rd. B. W. Buckman, Wrightstown.

Ten Ears Any Other Dent.—1st. Harry B. Herr; 2nd. David B. Landis, Lancaster; 3rd. Valley Hill Farm, Phoenixville.

Champion Ten Ears, Any Variety.—Jesse L. Eisiminger.

Ten Ears Flint Corn.—Harry Rockwell, Canton.

Single Ears—Yellow Dent.—1st. Leasure Eisiminger; 2nd. Burton Bayard; 3rd. A. and T. Crowell, Avondale.

Single Ears—White Dent.—1st. B. W. Buckman; 2nd. Dr. Vallie Hawkins; 3rd. W. B. Cloud, Kennett Square.

Single Ear—Any Other Dent Corn.—1st. Harry B. Herr; 2nd. David M. Landis; 3rd. Valley Hill Farm.

Single Ear—Flint.—1st. Harry B. Rockwell.

STATE CAPITAL NEWS

Forthcoming Bulletins.—Bulletins are to be issued shortly by the State game commission giving information regarding species of hawks and owls. The placing of a bounty on some kinds of hawks has led to the killing of useful ones and to people getting into trouble for killing protected birds. Dr. Surface will put out a new bulletin on San Jose scale and the parasites which kill it, giving the results of the latest studies on the subject, while the department of agriculture is contemplating one on the soils, another on the cheese industry and some valuable information on wages.

Paying For Fairs.—Auditor General Powell and State Treasurer Young have begun the payment to counties of shares of the state funds as reimbursement for aid to agricultural exhibitions or county fairs. This payment was for sometime in question as it was doubted whether the appropriation complied with the very strict provisions of the organic law and the "specific appropriations" act, but an opinion from the attorney general's department and a few precedents appear to have straightened matters and about half of the $100,000 available is being paid.

Auto Revenue Controversy.—Renewed steps are to be taken by the State Highway Department and the attorney general's office to obtain some of the hundreds of thousands of dollars paid in for licensing of automobiles for use in maintenance of State main highways this summer. The last mandamus suit was sidetracked because it made a demand for money under an act which did not go into effect until later. This new proceeding will be for a certain share of money known to have been paid since January 1 and will open the way for a court determination of the much mooted question as to whether the money was legally appropriated by the legislature of 1913 or whether some one made a colossal blunder in imagining that it could be counted in as available for road improvement in 1913 and 1914.

Supervisors' Meeting.—Supervisors in charge of township roads thruout the state are holding conventions at county seats just now and practically two thirds of them have been organized into associations. At these meetings the beneficient purposes of the township bureau act with its free advice and plans and specifications are explained, but up to date no use of road drags, scrapers, road rollers or stone crushers bought by the Highway Department last year and not likely to be used this year because of the lack of funds, has been offered to the township authorities. If some of the machinery lying along the roads or stored in various counties could be put into the hands of township supervisors with a representative of the State Highway Department to instruct in its uses after the weather moderates and the road working season opens it would be of great value.

Getting Together.—People who have suffered from the results of laws passed in pursuance of political propaganda and who saw the jockeying over the employment bills and the fight over the liability bill last session will note with particular pleasure the efforts of the department of labor and industry to get people interested in various phases of the women and children's employment laws on a basis of understanding what each side wants and of then formulating legislation plans.

Grade Crossings.—The Public Service commission has completed a set of regulations for the crossing of steam and electric railroads and hereafter all drafts of cars being shifted must carry a rear light. It is expected that a new set of rules governing over 10,000 or more grade crossings in the State will soon be given out.

The Chicken Hoax.—Singular as it may seem some of the State offices here have been receiving complaints about the activities of some individuals who have been victimizing people in rural districts thru pretension of being chicken inspectors, in some cases fowls or eggs as "samples" having been secured. The only persons authorized to act on any inspection work which might include chicken coops or barnyards are agents of the State Live Stock Sanitary Board, and these officers are supplied with badges or other evidences of official position and must show them on request.

More State Police.—It seems highly probable that owing to the demand of people in rural districts for more state police an increase of the constabulary will be authorized by the next legislature, although opposition will be encountered from the members from industrial districts. Unfortunately, in spite of the service of the state police the prejudice against them is as strong as ever in certain sections of the state altho farming communities are now reported as anxious to have the presence of the troopers.

Using Forest Reserves.—Father Penn's forest reserves are being variously utilized. In addition to the new penitentiary now being erected on the reserves in Centre county it is proposed to locate on state lands the new reformatory for women and girls and the cottage colony for feeble minded women. The former institution is to be similar to that at Huntingdon for boys and the latter will relieve counties from the care of women of child bearing age who are obviously feeble minded.—Hamilton, Harrisburg, Feb. 16.

NEW JERSEY FARM NEWS

Good Crops at State Farm.—Last year was another season of bumper crops at the farm connected with the State hospital for the insane. The total value of the farm products was $31,832.42, as against $30,612.47 for 1912.

Appropriations For Water Ways.—Congressman Thomas J. Scully, of the Third District, who is the first Jerseyman ever to serve upon the important Rivers and Harbors Committee, has been successful in securing total appropriations for the rivers and harbors of New Jersey of $2,050,800. The farmers of the State should welcome these appropriations with joy, for it means the revival of the steamboat industry. That will mean for the farmers, lower freight rates, lower charges for cartage, because the truckmen can secure the produce at convenient wharves instead of having to make the long trip to the railroad yards in Jersey City or Camden; and also that the produce will reach the market fresh and dustless, thereby commanding a higher price.

Weights and Measures.—William L. Waldron, superintendent of this State department says that every thing should be sold by weight. He regards such a system as practicable. In 1913 the total number of devices tested and sealed by his department was 294,999, of which 13,374 were condemned and confiscated as below the standard. There were 199 prosecutions during the year, the fines collected aggregating $4,617. Under the basket law of last year the department has confiscated thousands of odd-sized baskets which have been replaced by standard sizes. It is suggested that the basket law be amended by imposing penalties and compelling basket manufacturers to mark legibly on each basket its capacity.

Campaign for Good Seeds.—The State-wide campaign for good seeds is on in earnest, and already a seed salesman has been arrested for a test case. This man sold a farmer two bushels of seed guaranteed to be red clover. The seed was transmitted to Prof. J. D. Helyar, State Seed Analyst, and he discovered that the seed was composed of 56.03 percent German millet, 42 percent clover, and the rest was weed. The mixture cost the salesman $4.29 a bushel and he sold it for $9. This same salesman also offered the farmers a seed he called Australian clover at 30 cents a pound, which Mr. Helyar says is really crimson clover worth about ten cents a pound. Other complaints have been made of similar transactions and further arrests will probably follow. Efforts will also be made to strengthen the present seed law before the Legislature adjourns.

Farm Exhibit Cars.—The Pennsylvania Railroad has sent out two farm exhibit cars for the purpose of interesting the farmers in more scientific methods and the improvement of their crops, both in quality and quantity. More perishable freight was shipped out of South Jersey last year than from the whole of Florida. These exhibition cars are under the charge of H. L. Lippincott, the chief agriculturist of the railroad. An expert from the State experiment station and a dairy expert are accompanying the cars, the second one of which is given over entirely to a display of dairy products.

Standard Cranberry Barrel.—The State Cranberry Growers' Association and the State department of weights and measures have both endorsed the bill by Senator White, of Burlington county, fixing a standard size for cranberry barrels. The bill provides that the standard cranberry barrel shall measure, Head, 16 1-4 inches in diameter; staves, 28 1-2 inches long, and not more than 4-10 of an inch thick; bilge, 58 1-2 inches outside circumference; distance between heads, 25 1-4 inches. Such barrels, the bill provides shall be branded or stenciled in a durable manner "Standard." This act is to take effect July 1, 1915.

New Road Bills.—Several new road bills have been introduced. One of the measures authorizes the appointment of a counsellor-at-law from the attorney-general's department, the State commissioner of public roads, one member of the Senate and one member of the House of Assembly as a commission to revise the laws relating to the improvements of roads, and appropriates $1,500 for the work. The other bills amend the road improvement act by providing that any county engineer holding office at the time of the adoption of the act shall be eligible for appointment as State engineer and the county supervisor shall be eligible for appointment as State highway foreman without examination; directs the commissioner of public roads to designate the route of the Lincoln highway; authorizes the appointment of county engineers as State resident engineers and assistant engineers; provides that the State shall aid in the construction or operation of bridges taken over under the provisions of the road improvement act of 1912; provides that the State shall pay the State engineer and his assistant when actually working for the State. Another of the bills amends the road improvement act of 1912 by providing that contracts shall be awarded to the lowest responsible bidder, whenever the board of freeholders shall deem it advantageous to secure bids on different classes of construction, or on guarantee of the duration of a pavement.

Urges More Normal Schools.—A. J. Rider, treasurer of the State Board of Agriculture, after careful consideration, and discussion with educators and others, makes the announcement that the State should provide a normal school in the Southern part of the State where teachers would be trained exclusively for service in the rural schools.—D. T. Hendrickson.

NEW YORK LETTER

Farmers' Week at Alfred.—From February 23 to 26, the sixth annual Farmers' Week exercises will be held at the State School of Agriculture at Alfred University. There will be about 70 lectures during the week besides which there will be a special program for teachers on one day and for women on another. The pricipal speakers will be Commissioner Huson, acting director Stocking, Dean Baker and Prof. Alva Agee, of New Jersey.

Dr. Schurman's Plan.—President Schurman of Cornell has recently suggested a scheme for a state wide campaign of agricultural education. He would have the agricultural college the "brains" of the system with other centers of education which would be in the nature of agricultural departments of high schools rather than as separate secondary schools of agriculture. The teachers in these agricultural departments would co-operate with the Farm Bureau agents and thus form an effective educational combination.

Great Store of Apples.—One does not get an accurate idea of the apple growing industry in this state by casual reading. Here are some condensed facts about the apple crop. There is at the present time in cold storage at the principal points in the western apple districts of the state about 517,000 barrels and 25,000 boxes. This last item is full of meaning which is that Western methods of packing are being adopted on a large scale. The 25,000 boxes are all in storage at Canandaigua. In view of the fact that the greater part of the crop has already been marketed, the apples now in storage really represent only a small part of the entire crop of the western New York apple district. It has been figured that it will require 3450 cars to move the stored crop which if made up in a solid train would extend 26 miles. The three largest storage quantities are at Albion, 78,000 barrels; Lockport, 67,000 barrels; Medina, 64,000 barrels.

News Items.—Gov. Glynn has named the state commission on the milk laws. Dr. Herman Biggs, state health officer, is at its head. State master Vary and secretary Giles of the state grange are on the committee. Gov. Glynn has sent a special message to the legislature on the necessity of establishing co-operative enterprises thruout the state, appointing experts in co-operation to instruct farmers how to organize, and to organize receiving stations in the large cities and shipping stations in the country to facilitate selling more direct to consumers. The legislature will not appropriate any money for the erection of more new buildings at the state fair grounds this year. The fair commission has decided not to hold a two weeks' fair. The state canals carried 2,602,035 tons of freight last year, of which 564,677 tons were thru freight. The Erie canal carried 1,788,453 tons.—D.

John Deere Two Way Plow

The Sulky with the Steel Frame and Patent Auto Foot Frame Shift.

A Few Strong Features

1 All Steel and Malleable Frame—Steel Arch: Strong—Light—Durable, Alignments Permanent.
2 Patent Auto Foot Frame Shift: Perfect Control—accurate width of cut.

Guaranteed STEEL ROOFING Right From the Factory

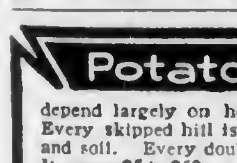
When you buy roofing from us you know before-hand just exactly what you are going to get. Your order will be filled under

Our Guarantee

that every sheet must be perfect, full weight, brand new, or it doesn't cost you a cent.
This kind of roofing is always cheapest in the end. We sell it to you for the same or less money than the ordinary competitive quality roofing. We sell you direct at exactly the same price your dealer would have to pay us and besides

We Pay the Freight

Our price list shows exactly what your roofing would cost laid down at your railroad station. Send today for catalog and samples Free.
The Ohio Galvanizing & Manufacturing Company
28 Ann St., Niles, Ohio



Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters

often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "100 Per Cent Potato Planting" and copy of Iron Age Farm and Garden News.

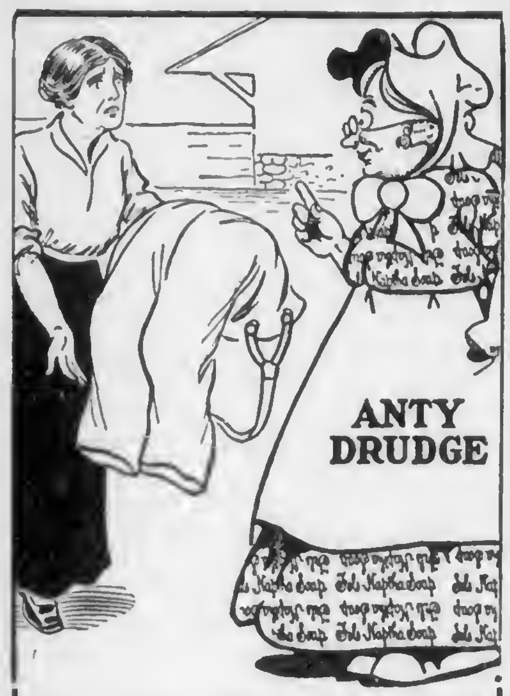
Wm. Galloway, Pres. William Galloway Co., 199 Galloway Sta., Waterloo, Iowa



Mrs Cornlassel: "Oh, dear! Just look at this! And smell it! John caught a skunk in the hen house last night—and his shirt and trousers are ruined. He didn't know what it was in the dark. I'll *never* get the smell out."

Anty Drudge: "Well—I don't know. That's one thing I've never meddled with. But if anything will bring out both stain and smell, it's Fels-Naptha Soap. Let's try it anyway. I see you have a box. That's right. I always tell everybody to keep plenty on hand."

Never be sure that a thing is ruined until you have tried washing it with Fels-Naptha Soap. If Fels-Naptha in cool or luke warm water doesn't do the work, you might as well throw the article away.

Fels-Naptha dissolves grease, makes dirt disappear and takes out all kinds of stains. Clothes washed with Fels-Naptha do not have to be rubbed hard nor boiled and are cleaner, sweeter and whiter than ever before. It does all kinds of housework easily, thoroughly and in less than half the time it used to take.

Just follow the easy directions on the red and green wrapper.

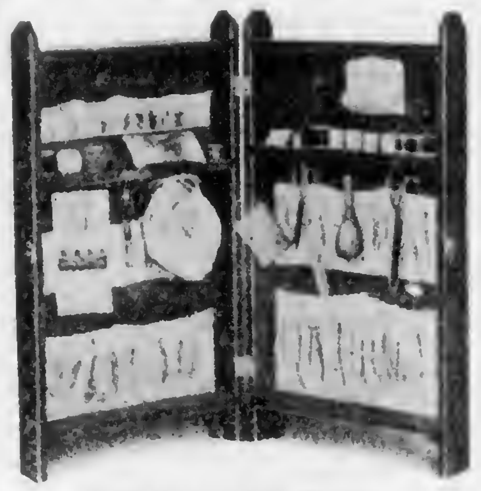
Better buy it by the carton or box

Fels & Co., Philadelphia.

Household

HOME-MADE SEWING SCREEN

Where there is no regular room in the house which can be set apart for sewing, a corner of a hall can sometimes be fitted up with the conveniences needed for satisfactory work. If the man of the house is handy a device which is easily made and which will surely be appreciated by any young housekeeper is a sewing screen, made as shown in the illustration. A convenient size is thirty-six inches high, thirty-six inches wide when open and about five to six inches deep. About nine inches from the top of the frame a strip is placed across each panel which helps to strengthen it and also acts as a very convenient spool shelf. A row of screw hooks on the under side makes places for hanging scissors, or any other sewing tool that can be hung up.



HOME-MADE SEWING SCREEN.

The screen may be made of pine or oak. For the covering of the sides use burlap such as is used in wall decorations. It comes in a variety of colors and is comparatively inexpensive. Finish the edges with upholsterers' tape and brass tacks.

The pockets on the inside of the screen can be made of cretonne, or sateen to match the burlap. These hold unfinished sewing, stockings that need darning, cotton and wool for mending, patterns, materials and all the small accessories of the modern sewing room. Such a screen can be carried upstairs or out on the porch or from room to room in half the time that is ordinarily spent in getting together the sewing materials.

MARYLAND HOMEMAKERS' WEEK

Over 120 Maryland women enjoyed the whole or a part of Homemakers' Week, January 12-17, at their Agricultural College. The subject of "Fibers and Textiles" was effectively presented by Mrs. C. W. Foulk, of Ohio, whose articles on "Facts about Foods" are features of our current issues. The light that she threw on all wool and cotton values, and the real nature of so-called bargains was a revelation to many of her hearers. The simplicity of the tests that she illustrated for determining textile quality made one wonder why more people do not study how to protect themselves better instead of guessing at every purchase and grumbling at the high cost of things. What could be easier to make than the fat test between linen and cotton? Take some samples, rub in a little olive oil. If the cloth remains opaque, you have cotton; if it becomes transparent, it is linen. But possibly you don't care about carrying a bottle of olive oil around with you while shopping. Well, then, use a little tube of vaseline instead. Make the test right at the counter where you buy.

Probably the lantern-slide illustrated evening lecture by Mrs. Foulk on "The Kitchen" was the most fascinating of the series. We followed step by step the changes which bring about happiness and lessened drudgery in the farm home. What a difference a window rightly placed may make. The farm woman may have a pretty view, flowers and trees in sight, and plenty of sunshine, or she may be looking out on a dreary backyard, messy and unkept, as farm yards too often are. She advised us to have the wall paper or the paint light colored, yellow or buff, because dark colors show smoke more and are depressing. Eliminate every dust catcher. Stuff the cracks. Have the wood trimming as plain as possible. Life is too short to be spent wearing out dust cloths. When you need artificial light in the kitchen, have your lamp in a bracket where it will throw the light directly on what you are doing. Don't lean over either the sink, the wash tub or the stove. Have them set high enough to suit you, not as the man who puts them in thinks they ought to be. Two pictures showed the right and wrong position at the sink. Have a clock in the kitchen. Learn to time your cooking. Measure accurately, time your cooking properly, for cooking by instinct and guesswork is sinful in these days of science applied to the homely things of every day. The lantern slides showed very graphically good and poor kitchen arrangement and equipment, cupboards, etc.

"Canning Fruits and Vegetables" was an absorbing topic, for here more than almost anywhere else time and temperature have been worked out with painstaking accuracy. Why the jelly don't jell or the tomatoes don't keep is something the good housekeeper discovers for good and all. Neither does she despise knowing how to use or buy meat to advantage. Mrs. Foulk put her students hard at work by having a butcher cut up the whole side of a steer on a table before them, and then quizzing them as to where each piece belonged.

Associated with Mrs. Foulk during the week was Miss Lena Bumpas, a Texas domestic science teacher, who is working for a degree at Ohio State University, who gave a most satisfactory demonstration of the "Chemistry of Cleaning," and of the "Preparation and Handling of Vegetables for The Table." Cooking cabbage without making so much odor in the house was one of the riddles made plain by the advice to cook it without the lid on, which allows the fumes from the sulphur content of this vegetable to gradually disappear in the air if one has enough ventilation in the kitchen at the time.

Dr. Martha B. Lyon, of Washington, D. C., supplemented the lectures on the making of the home with a series of talks on "Home Nursing," "Care of Babies," "Poisons and Their Treatment," "Bandaging," "Emergency Work, and Artificial Respiration." These lectures, like those of Mrs. Foulk, were so deftly illustrated and the opportunity for questioning and practice so readily given that every woman present had a chance to make sure on any doubtful points before the lecturer proceeded. Nothing like knowing what to do for that reckless boy of yours, whether he has a stone bruise or falls into the ice pond.

Whether they planned meals with Mrs. Foulk or peeked at horrid little bacteria thru Dr. Appleman's microscopes while learning why bread doesn't always rise or why milk will sour or butter won't come, our Maryland homemakers, present and future, thoroly enjoyed their educational vacation. The week—all too short—at their agricultural college has made them hope that soon there will be courses for their girls as well as for their boys at Maryland Agricultural College to train them in the labor to which they shall give their lives. A large degree of the credit for arranging this year's as well as last year's Homemakers' Week Course is due to Mrs. H. J. Patterson, wife of Pres. Patterson of Maryland Agricultural College.

Rubber Hanger.—In the winter season, when there are so many overshoes and gloves to be taken care of, I find the spring clothes pins excellent helps. I fasten a stout cord to each and suspend the pin from hooks on which coats are hung. A pair of overshoes, gloves or caps can be harmlessly nipped by these spring clothes pins, thus keeping them off the floor and in pairs. Longer cords can be used to bring the pins within reach of children.—Mrs. H. B. Walker.

PENNSYLVANIA FARMER PATTERNS.

Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.

"You've always told me the truth."

Drawn expressly for Montgomery Ward & Co. by Hanson Booth

From the very first word in the first Montgomery Ward & Co. tiny folder down to the last letter in the latest Big Catalogue, customers have been told the *absolute* truth. Not one picture, not one description has been tinted or tainted with exaggeration or deception.

Every article listed in Ward's catalogue is *delivered* just as described—and every description is accurate to the minutest detail.

There's no danger of *self-deception*—you don't depend upon your eyes to find faults or to measure merits. The word of Ward means absolute fidelity and makes full value as certain for the uninformed as for the best posted buyer.

Montgomery Ward & Company's Catalogue is a big volume of value and variety, as well as a book of *truth*. No matter where you live it places right at your finger tips the world's most complete assortment of dependable merchandise. It saves your dollars, not only because it quotes lower prices but because it gives you goods that render longer and more satisfactory service. It enables you to choose almost any necessity or luxury desired by man, woman or child. It's a big fifty acre store—a store with miles upon miles of counters and shelves laden with the best offerings of many nations—a store whose door swings back at your command—where thousands of competent clerks stand ready to serve you, swiftly, silently without argument or suggestion to sway your selections—where every buy is a bargain and every transaction is stamped with satisfaction.

Have this "Big Store" in your home. Give yourself and family the benefits and delights of dealing where every trade is founded on truth—where every promise is promptly fulfilled—where you *save* when you *spend*. Use attached coupon *now*.

MONTGOMERY WARD & CO.

NEW YORK CHICAGO KANSAS CITY FORT WORTH PORTLAND

Grange

NEW YORK STATE GRANGE MEETING

The 41st session of the New York State Grange was held in Poughkeepsie on February 3 to 6, and comprised 570 voting delegates. Fully as many others were present as visitors. According to the secretary's report the fully paid up membership in the State at the end of the fiscal year, September 30th, 1913, was 107,986, a gain of 4,321 during the past year. There was membership in arrears on the above date 1,307, making a total actual membership of 109,293. The number of Granges is 838; 32 having been organized the past fiscal year. The financial statement shows receipts for the year, $31,441.49.

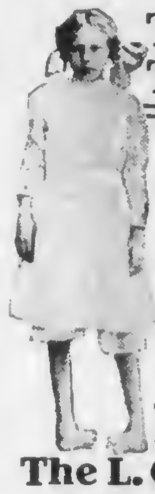
Master's Address.—In his opening address, State Master Vary said that New York continues to lead in membership and contributes about one-twelfth of the total receipts of the National Grange Treasury. Speaking of co-operative efforts by the State Grange, he spoke of grange fire insurance as one of the most successful. One grange company reports a saving to the members during the past twenty year of $668,360, an average annual saving of $33,418. It has been demonsrated over and over again that the farmers are amply competent to conduct the business of fire insurance on co-operative lines. Concerning the State Grange Purchasing Agency, the State Master remarked that the amount of business for the year ending December 31, was $392,000, but this amount, large as it seems, does not average high according to the number of granges in the state. Considerably less than one-half of the granges have taken advantage of the opportunities offered. Over $31,000 worth of seed was purchased, the saving on this item alone amounting to many hundred dollars.

In regard to reforms in our methods of assessment and taxation, Mr. Vary suggested three ways in which the burden of excessive taxation may be materially lessened. First by equal and just assessment and taxation laws, duly enforced, requiring all property to pay its just share. Second, by retiring to private life a large number of useless political office holders. Third, by reducing the salaries of a large number of others to a plane somewhere commensurate with their abilities and duties.

Election.—The biennial election of officers was held. Principal officers are as follows: Master, W. H. Vary, Watertown, N. Y.; Overseer, S. J. Lowell, Fredonia, N. Y.; Lecturer, F. E. Alexander, Pulaski, N. Y.; Treasurer, W. L. Bean, McGraw, N. Y.; Secretary, W. N. Giles, Skaneateles, N. Y.

Roads.—The Committee on Good Roads deplored the application of so much of the highway funds to the construction of trunk lines in the state. The waste and misappropriation of much of these funds was also deplored, and the construction of more market roads was desired.

Legislative Matters.—The committee on legislation reported on a variety of subjects. The following propositions were adopted. Use of traction engines on highways only under certain restrictions. Appropriation of state moneys for new buildings at Geneva Experiment Station. Amending drainage laws so as to secure drainage rights across lands whose owners may be opposed. Amending the Commission Merchants' bill to require such dealers to keep record of sales and to notify shipper of same. Recommending an enactment of Assembly bill No. 61, relative to equipment of railroad trains. Approving the federal prohibition of the manufacture of malt or spirituous liquors. Asking for a county option bill to control the liquor traffic in counties. Asking the public Service Commission for better service on rural telephone lines. Approving a fine of $25 for Sunday hunting. Asking for legislation to preclude brokers in farm lands from demanding a commission on sale, unless they had a written contract with the owner. Asking for the increase of jurors' fees in justices' courts from 25 cents to $2 per day. Approving the censorship of all songs offered for sale in the State. Favoring the extension of time limit for stock in transportation from 24 to 28 hours before unloading. Asking the state to pay all just claims for cattle killed by the state.—D.



These Pictures Tell The Story

Gertrude Snyder, thirteen years old, daughter of Robert Snyder of Natrona, Pa. was born with Club Feet and was brought to this Sanitarium in May, 1911. The position of her feet at that time is shown in left picture, while the position and condition of her feet at the present time, after treatment at this Sanitarium, is shewn in picture on right. Write Mr. Snyder; he will be glad to tell you of his experience.

The correction was made without Chloroform, Ether or any General Anaesthetic. Plaster Paris was not used.

The L. C. McLain Orthopedic Sanitarium

This thoroughly equipped private Sanitarium is devoted exclusively to the treatment of crippled and deformed conditions, such as Club Feet, Infantile Paralysis, Hip Disease, Spinal Diseases and Deformities, Wry Neck, Bow Legs, Knock Knees, etc.

Let us advise you regarding any crippled, paralyzed or deformed child or person in whom you may be interested. It will cost you nothing, and in view of over 30 years' experience our advice should be valuable.

A book entitled Deformities and Paralysis, also a book of references, with testimonials from practically every state in the Union, will be sent, free of charge.

The McLain Orthopedic Sanitarium
905-R Aubert Avenue, St. Louis, Mo.

Better Than Expected
The rocker is much nicer than I expected. My neighbors say the chair alone would cost me $5 at stores. The products also are very good indeed.
Mrs. E. J. Bailey, Alton, Ill.

30 Days' Trial Before You Pay

After you have had the Rocker and Grocery Products 30 days, if you are thoroughly satisfied, you send us only $5.00. If not satisfied, write us and we will take them away, pay all freight charges so you won't be out one cent. We make this remarkable offer to induce you to try our Products and see how you can get hundreds of useful articles in Furniture, Clothing, Silverware, Jewelry, Dishes, Glassware—anything for the home without extra cost.

Send No Money—Just the Coupon

Write your name and address plainly in the coupon below—give two references, your pastor and banker, or a business man—mail it to us. We will ship the $5.00 worth of Products and Rocker immediately. When you get them, if for any reason they are not satisfactory after you have tested them 30 days or before the 30 days are up, you can return them at our expense. You are not obliged to keep them. We leave everything to you.

Description of Rocker

This rocker is made of selected hardwood, is screw fastened in the most approved manner, which any furniture man will tell you is the most satisfactory way of putting a chair of this kind together. Back is artistically shaped, has seven turned spindles joining the top and bottom panel. Front and back posts also are turned. Arms are shaped, strongly fastened to back and seat. The finish of this rocker is equal to that of a chair selling for $5.00 to $10.00. It is finished in the very best American Quartered Oak and the polish is superb. You would pay as much or more at a furniture store as our price of $5.00 for a rocker as good as this one, and you would get no products with it. It is 38 inches high, 24 inches wide and 15 inches from the floor.

EEDING CATTLE ON EASTERN FARMS

(Continued from page one)

ding cattle is where corn silage is l. It not only furnishes the feed in more succulent form, but it also rees the cost of making a pound of in. It makes it possible to elimie from the ration the corn during early part of the feeding period. e only grain necessary is the cottond meal and what corn is in the silage. y may be fed in addition to the sil. While the daily gains are not so ge as when grain is fed from the bening, the cost of a pound of gain is terially reduced. This is especially e when the cost of corn and grain ds are high as at the present time.

lany Pennsylvania farmers grind the corn for their fattening cattle. Such ctice is expensive and involves an litional amount of labor which is not overed by additional gains for the l consumed. It is more desirable to tinue feeding broken ear corn until e late in the winter, when shelled n is to be preferred.

attle feeding cannot be successfully ducted when ear or shelled corn ed unless hogs are allowed to follow cattle in the feed lot. There is conerable corn that passes thru the cat undigested and is lost unless hogs present to consume the waste. The e of the pork produced is often the fit to be derived from feeding cattle. s value will vary with the amount of n fed and the length of time they ow the cattle. The additional profit m feeding cattle, due to the pork duced, at the Pennsylvania State Col last year, amounted to about $2.25 steer. It is customary to allow t two hogs for every three steers the cattle are on full feed.

elter is an important consideration. is necessary to build new shelter ould be put up in the form of innsive, open sheds in preference to nsive barns. When expensive barns built the overhead charge for shels high. Another point to be conred is that cattle will do better in sheds than in the warm basement s. If the cattle can be kept out e open most of the time, but prod from the cold winds, sleet and , they have a better appetite and also less subject to disease. In a s of tests on the open shed as comd to warm basement barns at the nsylvania State College, the results in favor of the open shed, six out even years. The following table ng the results for the winter of 1910 1911 is similar to those obtained for years:

	Barn Lot	Open Lot
per cwt. gain .	$11.05	$10.03
gain, lbs ...	2.136	2.362
cost per cwt.	$ 6.63	$ 6.46
value per cwt.	7.60	7.75
l per steer ...	10.69	14.67
rns per bu. corn	0.99	1.108

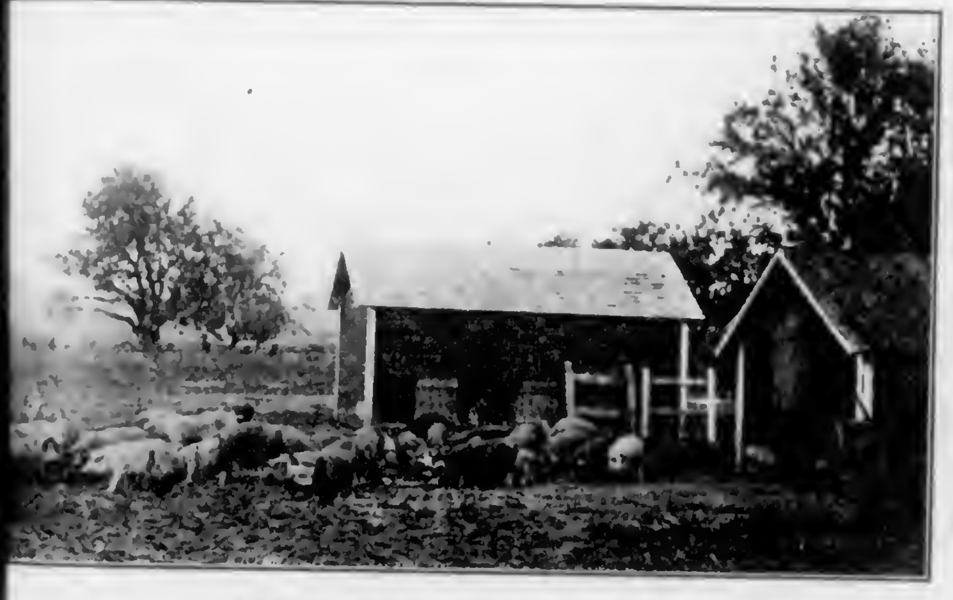
is table indicates that it is poor my to house feeding cattle in warm ment barns. However, if basement her barns are a part of the buildon the farm, it is not necessary to sheds and permit these barns to lle. These can be so arranged that cattle can go in and out at will. ment barns with open doors or sides ected with small yards can be subted for open sheds with entire sattion. Large yearly profits can not xpected from feeding cattle. It however, give good returns for all fed, provide a market for many lable products, keep up the fertility of the soil and result in large crop yields from year to year.

SMALL MOVABLE BUILDINGS

Movable farrowing houses of sundry types are to be found everywhere. Their chief value resides in their handy movability. But movable buildings of larger size are rare.

Soon after having come to the farm a dearth of hog shelter, coupled with the inadvisability of erecting a large permanent house led us to plan the largest building that we thought could be moved with comparative ease. Two of these were put up, 16 feet long, 8 feet wide, and 6 feet high to the plate, with gable roofs of shingles. The frame is of oak thruout, sills being 4 by 4 inches and all other timbers 2 by 4 inches. First-class house siding was used, and the buildings thoroly painted three coats. The cost of these buildings including labor was about $35 each. Since that time we have built two others of same dimensions, except being four feet shorter; one with a shed roof, which we have learned to prefer. This latter house has a matched floor, and is used generally for temporary storage, such as seed and fertilizer in a distant field, cement on site of construction, grain at threshing, hog feed, cooker fuel, etc.

The larger houses are subdivided so as to accommodate three sows at farrowing time, removable gates being used; each building containing three outside doors (small), one of which (in the end) contains a supplemental door above, which when open provides an entrance six feet in height. These buildings are provided with temporary floors in three sections, made of old lumber, and used principally at spring farrowing. At most times the partition gates and floors are not in use. At spring farrowing we usually store straw above the pens in these houses by laying a few loose boards or rails across the gates, which are 40 inches high. When not otherwise in use, these buildings have provided shade for sheep or cows in the pasture, for young chicks, for storage of all kinds. They may be filled with corn for late fall feeding.



A GROUP OF MOVABLE FARM BUILDINGS.

Altho one of these buildings is provided with runners, yet we never use them, for we have found it much easier and less racking on the building to use two flat sleds connected by a chain. Our sleds were made by taking sawed oak fence posts that had rotted off at the ground, for runners. This makes them about four feet long. Each end is mortised an inch on top to admit a 2 by 4 inch cross piece to be spiked on, also four feet. Both ends of the runners are sloped so as to make the sled reversible. We block up the house, place the sleds, move, and get the building down easily in an hour. Sleds facilitate easy turning; reversible sleds provide for making "Y's" where the turn is too short to be made in the usual way.

In moving such buildings at first we used three horses, but now we never use but two. To avoid accidents never hook on the team until all is ready to start. When having arrived at the new site, the first thing to do is to take off the team. We have had these movable buildings all over the farm; we can easily provide farrowing quarters in any field, or shade for hogs in summer, just where it is needed. Five years' use has not seemed to rack the buildings in the least, altho they have been moved more than a dozen times, and often as much as a half a mile. Windows are likely to get broken, so we use none. We have preferred shingle roof on account of being cooler in summer.—G. P. Williams, Delaware Co., O.

It's a Pleasure to Farm in the South

NATURE coöperates with you at every turn in the Southeast. Crop failures are hardly known.

You are favored with 200 to 300 growing days, which allow two and three crops from the same land each season.

Expensive Irrigation is unnecessary, as 45 to 60 inches of rain, well distributed through the growing season, fall annually.

The assortment of crops raised in the Southeast is the greatest anywhere in America. From the tropical citrus fruits to the finest varieties of apples, peaches, pears, grapes and numerous other fruits and nearly every known variety of grains, vegetables, grasses and legumes can be produced somewhere in the Southern Railway territory.

And with all these superior advantages Southeastern land now averages less than one-half the price of farms in other parts of America.

$15 to $50 An Acre Buys Excellent Homesteads

where the climate is exceedingly agreeable and healthful, where railroad communication is of the highest order and transportation to Northern markets but 24 to 48 hours. Life in the rural sections of the South is all that could be desired. Modern highways and telephones, the best of high and agricultural schools, good churches and trading centers—all these advantages are to be had in this growing section.

INVESTIGATE SOUTHERN CONDITIONS

Avail yourself of the low Homeseeker's Rates. Write for particulars. Learn of the favorable conditions in the South. Ask for the "Southern Field" magazine, state booklets on Virginia, North or South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee and Kentucky. Let us know the state and line of farming in which you are interested.

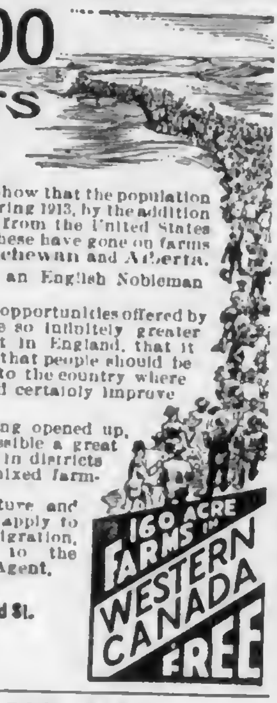
400,000 Settlers a Year



160 ACRE FARMS IN WESTERN CANADA FREE

Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms to Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

F. A. Harrison, 210 N. Third St. Harrisburg, Pa.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXII (concluded)

"Fate, or my own folly, has put it out of my power to denounce you without abandoning what I have set my heart upon, and after all it is not my business," he said. "I will give you five hundred dollars and you can go to Chicago or Montreal, and consult a specialist. If the money is exhausted before I send for you, I will pay your hotel bills, but every dollar will be deducted when we come to the reckoning."

Courthorne laughed a little. "You had better make it seven fifty. Five hundred dollars will not go very far with me."

"Then you will have to husband them," said Winston dryly. "I am paying you at a rate agreed upon for the use of your land and small bank balance handed me, and want all of it. The rent is a fair one in face of the fact that a good deal of the farm consisted of virgin prairie, which can be had from the Government for nothing."

He said nothing further, and soon after he went out Courthorne went to sleep, but Winston sat by an open window with a burned-out cigar in his hand staring at the prairie while the night wore thru, until he rose with a shiver in the chill of early morning to commence his task again.

A few days later he saw Courthorne safely into a sleeping car with a ticket for Chicago in his pocket, and felt that a load had been lifted off his shoulders when the train rolled out of the little prairie station. Another week had passed when, riding home one evening, he stopped at the Grange, and as it happened found Maud Barrington alone. She received him without any visible restraint, but he realized that all that had passed at their last meeting was to be tacitly ignored.

"Has your visitor recovered yet?" she asked.

"So far as to leave my place and I was not anxious to keep him," said Winston, with a little laugh. "I am sorry he disturbed you."

Maud Barrington seemed thoughtful. "I scarcely think the man was to blame."

"No?" said Winston.

The girl looked at him curiously, and shook her head. "No," she said. "I heard my uncle's explanation, but it was not convincing. I saw the man's face."

It was several seconds before Winston answered, and then he took the bold course.

"Well?" he said.

Maud Barrington made a curious little gesture. "I knew I had seen it before at the bridge, but that was not all. It was vaguely familiar, and I felt I ought to know it. It reminded me of somebody."

"Of me?" and Winston laughed.

"No. There was a resemblance, but it was very superficial. That man's face had little in common with yours."

"These faint likenesses are not unusual," said Winston, and once more Maud Barrington looked at him steadily.

"No," she said, "of course not. Well, we will conclude that my fancies ran away with me, and be practical. What is wheat doing just now?"

"Rising still," said Winston, and regretted the alacrity with which he had seized the opportunity of changing the topic when he saw that it had not escaped the notice of his companion. "You and I and a few others will be rich this year."

"Yes, but I am afraid some of the rest will find it has only further anxieties for them."

"I fancy," said Winston, "you are thinking of one."

Maud Barrington nodded. "Yes. I am sorry for him."

"Then it would please you if I tried to straighten out things for him? It would be difficult, but I believe it could be accomplished."

Maud Barrington's eyes were grateful, but there was something that Winston could not fathom behind her smile.

"If you undertook it. One could almost believe you had the wonderful lamp," she said.

Winston smiled somewhat dryly. "Then all its virtues will be tested tonight, and I had better make a commencement while I have the courage. Colonel Barrington is in?"

Maud Barrington went with him to the door, and then laid her hand a moment on his arm. "Lance," she said, with a little tremor in her voice, "if there was a time when our distrust hurt you, it has recoiled upon our heads. You have returned it with a splendid generosity."

Winston could not trust himself to answer, but walked straight to Barrington's room, and finding the door open went quietly in. The head of the Silverdale settlement was sitting at a littered table in front of a shaded lamp, and the light that fell upon it showed the care in his face. It grew a trifle grimmer when he saw the younger man.

"Will you sit down?" he said. "I have been looking for a visit from you for some little time. It would have been more fitting had you made it earlier."

Winston nodded as he took a chair. "I fancy I understand you, but I have nothing that you could expect to hear to tell you, sir."

"That," said Barrington, "is unfortunate. Now, it is not my business to pose as a censor of the conduct of any man here, except when it effects the community, but their friends have sent out a good many young English lads, some of whom have not been too discreet in the old country, to me. They did not do so solely that I might teach them farming. A charge of that kind is no light responsibility, and I look for assistance from the men who have almost as large a stake as I have in the prosperity of Silverdale."

"Have you ever seen me do anything you could consider prejudicial to it?" asked Winston.

"I have not," said Colonel Barrington.

"And it was by her own wish Miss Barrington, who, I fancy, is seldom mistaken, asked me to the Grange?"

"It is a good plea," said Barrington. "I cannot question anything my sister does."

"Then we will let it pass, tho I am afraid you will consider what I am going to ask a further presumption. You have forward wheat to deliver, and find it difficult to obtain it?"

Barrington's smile was somewhat grim. "In both cases you have surmised correctly."

Winston nodded. "Still, it is not mere inquisitiveness, sir. I fancy I am the only man at Silverdale who can understand your difficulties, and what is more to the point, suggest a means of obviating them. You still expect to buy at lower prices before the time to make delivery comes?"

Again the care crept into Barrington's face, and he sat silent for almost a minute. Then he said, very slowly, "I feel that I should resent the question, but I will answer. It is what I hope to do."

"Well," said Winston, "I am afraid you will find prices higher still. There is very little wheat in Minnesota this year, and what there was in Dakota was cut down by hail. Millers in St. Paul and Minneapolis are anxious already, and there is talk of a big corner in Chicago. Nobody is offering grain, while you know what land lies fallow in Manitoba, and the activity of their brokers shows the fears of Winnipeg millers with contracts on hand. This is not my opinion alone. I can convince you from the papers and market reports I see before you."

Barrington could not controvert the unpleasant truth he was still endeavoring to shut his eyes to. "The demand from the East may slacken," he said.

Winston shook his head. "Russia can give them nothing. There was a failure in the Indian monsoon, and South American crops were small. Now, I am going to take a further liberty. How much are you short?"

Barrington was never sure why he told him, but he was hard pressed then, and there was a quiet forcefulness about the younger man that had its effect on him.

"That," he said, holding out a document, "is the one contract I have not covered."

Winston glanced at it. "The quantity is small. Still, money is very scarce and bank interest almost extortionate just now."

A Familiar sight the world over

Enough "Bull" Durham is sold in a year to roll approximately 32,000,000 cigarettes every day.

"Bull" Durham is distinguished from all other tobaccos by a wonderful, sweet, mellow *flavor* and *fragrance*, irresistibly attractive and satisfying. No other tobacco product *can* have this "Bull" Durham flavor and fragrance. They are produced by a generations-old process known only to the manufacturers of "Bull" Durham. Every visitor who approaches Durham, N. C., where "Bull" Durham is manufactured, is impressed with this delightful, distinctive fragrance that envelops the whole city. There is nothing else like it in the world.

GENUINE

"BULL" DURHAM

SMOKING TOBACCO

(Enough for forty hand-made cigarettes in each 5-cent sack)

Enough "Bull" Durham is sold in a year to make approximately *12 BILLION* cigarettes—as many as all brands of ready-made cigarettes in this country *combined*—and the sales are steadily *growing*. Proof that millions of smokers *prefer* the cigarettes they roll for themselves from "Bull" Durham, to any ready-made kind.

Get a sack of "Bull" today and "roll your own" for complete, healthful *enjoyment* and lasting *satisfaction*.

Ask for FREE book of "papers" with each 5c sack.

FREE An illustrated Booklet, showing correct ways to "Roll Your Own" Cigarettes, and Book of cigarette papers, will both be mailed to you, *free*, on postal request. Address "Bull" Durham, Durham, N. C.

Barrington flushed a trifle, and there was anger in his face. He knew the fact that his loss on this sale should cause him anxiety was significant, and that Winston had surmised the condition of his finances tolerably correctly.

"Have you not gone quite far enough?" he said.

Winston nodded. "I fancy I need ask no more, sir. You can scarcely buy the wheat, and the banks will advance nothing further on what you have to offer at Silverdale. It would be perilous to put yourself in the hands of a mortgage broker."

Barrington stood up very grim and straight, and there were not many men at Silverdale who would have met his gaze.

"Your content is a little too apparent, but I can still resent an impertinence," he said. "Are my affairs your business?"

"Sit down, sir," said Winston. "I fancy they are, and had it not been necessary, I would not have ventured so far. You have done much for Silverdale, and it has cost you a good deal, while it seems to me that every man here has a duty to the head of the settlement. I am, however, not going to urge that point, but have, as you know, a propensity for taking risks. I can't help it. It was probably born in me. Now, I will take that contract up for you."

Barrington gazed at him in bewildered astonishment. "But you would lose on it heavily. How could you overcome a difficulty that is too great for me?"

"Well," said Winston, with a little smile, "it seems I have some ability in dealing with these affairs."

Barrington did not answer for a while, and when he spoke it was slowly. "You have a wonderful capacity for any one to believe in you."

"That is not the point," said Winston. "If you will let me have the contract, or, and it comes to the same thing, buy the wheat it calls for, and if advisable sell as much again, exactly as I tell you, at my risk and expense, I shall get what I want out of it. My affairs are a trifle complicated and it would take some little time to make you understand how this would suit me. In the meanwhile you can give me a mere I O U for the difference between what you sold at, and the price today, to be paid without interest and whenever it suits you. It isn't very formal, but you will have to trust me."

Barrington moved twice up and down the room before he turned to the younger man. "Lance," he said, "when you first came here, any deal of this kind between us would have been out of the question. Now, it is only due to tell you that I have been wrong from the beginning, and you have a good deal to forgive."

"I think we need not go into that," said Winston, with a little smile. "This is a business deal, and if it hadn't suited me I would not have made it."

He went out in another few minutes with a little strip of paper, and just before he left the Grange placed it in Maud Barrington's hands.

"You will not ask any questions, but if ever Colonel Barrington is not kind to you, you can show him that," he said.

He had gone in another moment, but the girl, comprehending dimly what he had done, stood still, staring at the paper with a warmth in her cheeks and a mistiness in her eyes.

(To be continued.)

AN EDITOR ON DUTY

Most anybody can be an editor, says the Boston Globe. All an editor has to do is to sit at his desk six days in the week, four weeks in the month, and twelve months in the year, and "edit" stuff as this:

"Mrs. Jones, of Lone Creek, let a can opener slip, last week, and cut herself in the pantry."

"A mischievous lad of Bungtown threw a stone and struck a companion in the alley last Tuesday."

"Joe Doe climbed on the roof of the house, last week, looking for a leak, and fell, striking himself on the back porch."

"While Harold Green was escorting Miss Violet Wise from a church social, last Saturday night, a savage dog attacked them and bit Mr. Green on the public square."

"Isaiah Trimmer, of Lebanon, was playing with a cat, Friday, when it scratched him on the veranda."

"Mr. White, while harnessing a broncho, last Saturday, was kicked just south of the corncrib."

Anybody can "edit" a newspaper. It's the easiest job and softest snap in the world.—Kansas Industrialist.

Corn Is Our Greatest Crop

It is worth more than any other crop
It costs more than any other crop

A big item in this cost is over one hundred million dollars' worth of actual potash, which the corn crop takes from American soils every year—more than eight times the total importations of

POTASH

The corn plant uses over a pound and a quarter of potash for every bushel of ears produced.

It uses more than twice as much potash as phosphoric acid.

Supplement the manure or clover sod by 400 to 600 lbs. per acre of a fertilizer containing at least as much potash as phosphoric acid—0-8-8 or 0-8-10—or broadcast 300 lbs. acid phosphate and 100 lbs. muriate of potash per acre after plowing and before harrowing, and drill in with the seed 100 lbs. per acre 2-8-8 goods. On muck lands broadcast 100 to 200 lbs. muriate of potash per acre.

To drive away cut worms and root lice, drill in 100 lbs. Kainit per acre with the seed. Potash makes more sound ears in proportion to the stalks. It makes much more and much better corn for either crib or silo. **Potash Pays.**

We sell potash in any amount from one 200-lb. bag up.

Write for prices and for free pamphlet on profitable use of fertilizers.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., Feb. 16, 1914.

Receipts of fancy print butter well cleaned up at top prices. Eggs were firm due to an expected falling off of receipts on account of present stormy weather. The demand was sufficient to absorb the limited receipts of fancy poultry stock. Fruits and vegetables show moderate offerings and firm prices.

Butter.—Western creamery, 31c; extras, 29c; firsts to seconds 25@27½c; special prints 35@38c; near-by prints, 32c.

Eggs.—Candled, 32@34c doz; extras, 30c. Current receipts at $8.10 per standard case.

Poultry.—Fowls, 19@20c; old roosters, 12@13c; pigeons, 25@30c pair.

Dressed Poultry.—Western fowls, 12@18c; roosters, 14½c; turkeys, 20@26c; squabs $2@4.85 doz.

Vegetables.—White potatoes, Pa., 70@85c bu. Onions, $2.75@3 per 100-lb bag. Peppers $2@2.25 per carrier. Eggplant $2.50@4.00 per crate. Lettuce $1@2.50 hamper. Beets, new 5@8c bch. Sweet potatoes, 40@55c bas. String beans, $2.00@3.50 hamper. Squash, $1.50@2.00 box. Cucumbers, Florida $4@6 hamper. Celery, 50@65c per doz. stalks. Cabbage, new $1.50@$2 ½-bbl crate, Cauliflower, $1.50@1.75 hamper.

Fruit.—Apples $3.50@6 bbl. Pineapples, per crate, $2.50@3.50. Pears, 50@75c bas. Grapes $4@7 keg; cranberries, $2.50@3.50 crate; lemons, $2.50@4 per box; grape fruit $2@4 per box; oranges, $2@3 per box.

Hay and Grain.—No. 3 hay, large bales, $17.50@18.00; No. 1 medium, $17@17.50; no grade, $10.00@12.00. Clover mixed hay, light mixed at $16.00@16.50. Straw No. 1 new straight rye, $16.50; No. 2 do., $15@15.50; No. 1 tangled rye straw new $12; No. 2 do., $11.00@11.50; No. 1 wheat straw, $9.50@10.00; No. 1 oat straw, $10.50@11.00; new shelled corn No. 2 yellow, 71½@72½c. Wheat, No. 2 red, 98@98½c No. 1 Northern, $1.03@1.04; No. 2 white oats, 45@45½c; No. 3, white, 45@45½c. Standard white, 44½@45c.

Coffee.—Rio 7s 9½c; Santos 4s 12⅛c. Mild Coffee.—Cordova, 13@16c.

Sugar.—Cut loaf, $5.10 cwt.; cubes, $4.35; powdered, $4.20; granulated, $4.10; standard granulated, $4.15; crystal A, $4.10.

Flour.—For 196 lbs. in wood, winter clear, $3.75@4.00; do straight, $4.20@4.40; favorite brands, $4.75@5.15; rye flour, Pa., $3.50@3.60 per bbl.

Hides and Skins.—Steers, abattoir, 16¾@17¾c; do country, 15c. Cows, country, 15c. Bulls, abattoir, 14½c; do. country, 13c. Calf skins, Nos 5 to 12 and up, $1.55@2.75; do green, 14@15c.

NEW YORK PRODUCE

New York City, Feb. 16, 1914.

With a short supply butter values are higher. Owing to the recent stormy weather egg prices are rather irregular altho there is a fairly well established advance. There is little demand for poultry, and receipts are rather light. Cold weather conditions have made uncertain values in fruits and vegetables.

Eggs.—State and near-by hennery whites fine to fancy, 39@40c; gathered whites, 39c; fair to good 37@38c; no grades, 34@36c; fresh gathered, firsts to extras, 30@31c; seconds to thirds, 26@29½c; no grades 20@23c; mixed 30@31c.

Butter.—Creamery, firsts to extras, 28@32c; thirds to seconds, 21½@27c; state dairy 20@22c; packing stock 16@19½c; process 20@23c.

Cheese.—Whole milk specials, 18@18½c do. common to fancy, 14½@17¾c; skims 5@14¼c.

Dressed Poultry.—Turkeys, dry, 23@25c; chickens, 14@25c fowls, 12@18½c; old roosters, 13½c; ducks 10@16c.

Live Poultry.—Prices not settled.

Vegetables.—Cabbage, $22.00@26.00 ton. Green beans, $1.50@4.50 bas. Carrots $1.75@2 bag. Cucumbers, $1@$2 doz. Lettuce 50c@$4 basket. Squash, $2.25@3 bbl. Celery, $1.50@4.00 per stan. case. Onions $2.75@3 100-lb bag. Tomatoes, $1.00@4.00 carrier. Peppers $2@2.75 per carrier Beets, $3@5 per 100 bunches. Potatoes, $1.75@5.50 bbl. Sweet potatoes, $1.50@2.00 bbl. Eggplants, $2.50@3.50 box. Cauliflower $1.00@1.75 bas.

Fruit.—Apples, $2.00@6.00 bbl. Cranberries $9@13.50 bbl. Pears, $2@3.75 bbl.

Grain.—Wheat No. 2, red $1.02; No. 1, Northern, $1.04¾; corn, new No. 3 yellow, 69¾c; oats, standard white 45@45½c.

PHILADELPHIA LIVE STOCK

Beef Cattle.—The market shows a better tone and choice steers brought good prices. Lancaster, Pa., and Ohio cattle were principally in evidence. The better class of cows as well as the most desirable calves closed a fraction firmer.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	3,934	8,358	4,948
Previous week	2,575	8,291	5,839

Best Steers	$8.80@9.00
Choice steers	8.60@8.75
Good	8.40@8.50
Medium steers	8.00@8.25
Common steers	7.50@7.75
Bulls	5.25@6.85
Fat Cows	6.20@7.00
Medium cows	4.75@5.75
Thin cows	3.00@4.50
Milk cows	45.00@75.00

Veal calves steady to firm.

Best calves	$11.50@12.25
Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do.	5.00@8.00

Sheep and Lambs.—There was a fair disposal of stock with the best lambs a trifle easier.

Choice wethers	5.75@6.00
Good do.	5.00@5.25
Common to medium	3.00@4.25
Ewes, fat	5.00@5.50
Extra lambs	8.25@8.50
Good to choice, do.	8.00@8.25
Common to medium	5.50@8.00

Hogs.—The market closed firm at the prices with a good absorption of arrivals. Western, as to size and quality $12.50@12.75.

City Dressed Stock.—Every kind of choice and prime meat commanded full values, with trade normal. Steers, 11@13½c; heifers, 10½@13c; cows, 8@11c. Veal calves, 14@15c; country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., Feb. 16, 1914

Cattle.—With only a supply of 75 loads compared with 100 loads the previous week and a good demand the market ruled 10 to 25 cents per cwt. higher. The light and medium grades sold at the most of the advance. Several buyers for weighty cattle were in the market and the good weight cattle sold from $8.90 to $9.15. The quality of the cattle on sale this week was better than last week. Heifers, fat cows and bulls were in demand and sold at about the same advance as steers. Fresh cows and springers slow and lower. With 125 loads on sale this morning, the demand was moderate, and the market slow and lower on all grades.

Good to choice	$8.90@9.00
Good 1,300-1,400 lb	8.30@8.70
Medium to good 1,200 1,300 lb.	8.10@8.35
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900 1,100 lb	7.60@8.00
Rough, half fat, 1,000-1,300 lb.	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700 900 lb.	5.50@6.50
Common to good fat bulls	5.00@7.50
Common to good fat cows	4.00@6.50
Heifers	5.50@7.75
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@90.00

Calves.—Receipts of calves fair and with good demand market closed 50 cents higher than Monday's prices. With 400 head on sale, today's calf market was steady.

Heavy and thin calves	$5.50@8.00
Veal calves	8.50@12.00

Sheep and Lambs.—The supply of sheep and lambs has been fair; with a good demand sheep ruled steady to strong, while the demand for lambs has not been so good and the close for the week was 15c per cwt. below Monday's prices. The demand for sheep today was only fair, tho the market was steady. Lambs were lower.

Prime wethers	$6.10@6.25
Good mixed	5.40@5.65
Fair mixed ewes and wethers	4.25@5.00
Culls to common	3.00@3.50
Spring lambs	5.50@8.00

Hogs. — The supply of hogs has been liberal; the market ruled steady during the early part of the week but the close for the week was 10 cents lower on all grades. Today's hog market was steady with 55 double-deck loads on sale

Prime heavy	$9.10@
Prime medium weights	9.10@
Heavy mixed	9.15@
Best heavy Yorkers	9.15@
Light Yorkers	9.15@
Pigs	9.00@9.05
Common to good roughs	7.75@8.35
Stags	6.75@7.25

BUFFALO LIVE STOCK

Buffalo, N. Y., Feb. 16, 1914

Cattle.—The cold weather and the active opening of the week restricted receipts and put the market in good condition on choice butcher grades. On the close the basis was unchanged. The supply was light and the market firm at the week's opening figures. Today's receipts were fairly liberal, totaling 3,750 head. The market was active and stronger.

Choice heavy steers	$9.00@9.25
Medium	8.25@8.75
Yearlings	8.00@8.50
Handy butchers	7.50@8.50
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.50@8.00
Butcher bulls	6.00@7.50
Feeders	6.25@7.00
Stockers	5.00@6.25
Cows and springers	35.00@85.00

Calves.—The trade was fair during the week with moderate receipts. The opening basis was $11@12 for choice veals. On the close the supply was light, the demand good and the market 50@75c higher. All grades were firm and the basis $12.50@13 on choice. With 800 head on sale, today's market was steady.

Choice veals	$12.50@13.00
Lights and thin	6.00@8.75

Sheep and Lambs.—The trade opened fair considering the liberal receipts and the demand was generally good for choice lambs; yearlings were scarce and sold higher during the week. The basis was $6@7.35. On the close the market was steady with liberal offerings. The best lambs brought $7.75@8. Yearlings were in fair demand and easy—the best brought $6.75@7. Choice handy sheep were firm. Wethers firm at $6@6.25. Today's run of 20,000 head was heavy but the market was generally steady to 25c higher.

Choice lambs	$8.00@8.25
Yearlings	7.00@7.25
Wethers	6.25@6.40
Ewes	5.75@6.00
Sheep	6.00@6.25

Hogs.—The active opening of the week put the market in fair shape, owing principally to the cold weather. York weights were firm and heavies were firm and higher. On the close the demand was light and the market 20@30c lower. City and country buyers took but a moderate number. Common grades were slow and lower. The basis on Yorkers was $9.05@9.10. Receipts this morning numbered 20,000 head. The market was steady to higher.

Heavies	$9.00@9.15
Mixed and medium	9.15@9.20
Yorkers	9.15@9.20
Light Yorkers	9.15@9.20
Pigs	9.15@9.20
Roughs	8.00@8.25
Stags	6.50@7.50

Horses.—The supply was fair, 600 head. Fair demand for choice heavy work teams. Best young, well matched, heavy teams, $650@700; medium, $500@600.—S.

NEW YORK MILK MARKET

The condition in the milk market was complicated last week by the heavy snow storm. Delayed trains on Sunday and Monday caused a shortage on the latter day of more than 5,000 cans. The farmers in some cases could not get their milk thru the drifts to the railroads and some of the roads, the New York Central Lines in particular, had great difficulty in moving their trains. Some of the big companies, the Borden and the Sheffield Farms in particular, were unable to supply all their customers and there was a shortage of certified milk for the babies. The February demand is normal, but the supply far exceeds it. It is expected that delinquents in the pasteurization of their supplies will soon find at the hands of the Board of Health how unsatisfactory it is to fail to take time by the forelock. Receipts of milk and cream in 40-qt. cans for the week ending February 14, were as follows:

Railroad	Milk	Cream
Erie	43,298	1,757
Susquehanna	9,475	546
West Shore	15,750	712
Lackawanna	51,675	1,290
N. Y. Central (long haul)	78,003	1,274
N. Y. Central (short haul)	11,570	86
Ontario	41,905	3,138
Lehigh Valley	36,984	886
Homer Ramsdell Line	3,350	25
New Haven	8,690	112
Pennsylvania	2,450	350
Other sources	1,655	14
Total	304,805	10,190

BALTIMORE LIVE STOCK

Baltimore, Md., Feb. 16, 1914.

Cattle.—Receipts for the week, 1,494 head against 2,108 last week.

Steers	$6.25@8.35

Sheep and lamb receipts for the week were 2,196 head against 4,470 last week. Fair supply; market steady.

Sheep	$3.50@6.25
Lambs	5.75@8.45

Hog receipts for the week were 14,930 head against 15,549 last week.

Light Western	$9.50@9.55
Heavy to medium	9.35@9.40
Near by	9.25@9.40
Pigs	9.00@9.25

Calves.—Receipts for the week were 308 head, against 219 head last week. Fair supply, market higher at $6.50@11.50.

ELGIN BUTTER QUOTATION

Elgin, Ill., Feb. 16, 1914.

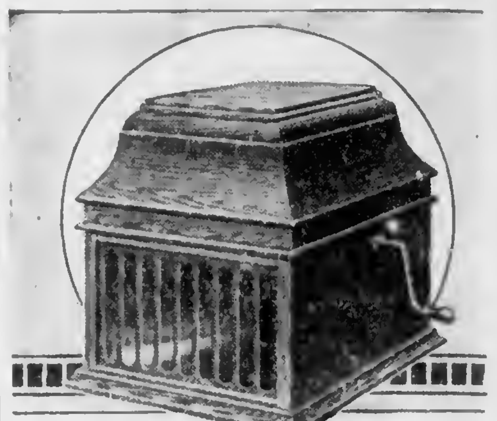
The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 30c.

TOBACCO MARKET

The sale of the new crop continued in a very limited way, several of the larger concerns having withdrawn their buyers and local packers waiting for lower prices. With the present improved conditions these packers may not realize their hopes. Some communities sold a part of their crop as follows: Manor Township 300 acres at $8@9; Leacock township one-third of crop at $8@9.50; West Lampeter, one-half of crop at $8.50@10, Rohrerstown, small sales at $9@10; Conestoga, one-half of crop at $8@10.50; Gap, large sales at $8@9 per cwt. At East Lampeter not much is sold and the same is true at Quarryville, Paradise and Ephrata.

The tobacco and corn show held under the direction of the Lancaster County Tobacco Growers' Association was a great success. The entries in all classes were numerous and worthy. Following are prize winners: Broad leaf filler—First, Geo. Hibshman; second, J. A. Herr; third, H. K. Landis. Broadleaf binder—First, L. H. Gochenauer; second, J. J. High; third, C. Mellinger. Broadleaf wrapper—First, Wayne Hartman; second, L. H. Gochenauer; third, J. S. Reynolds. Havana wrapper—First, M. H. Good; second, A. S. Shaubach; third, M. H. Good. An interesting feature of the show was an exhibit of some fifty samples of tobacco grown in various parts of the country from Wisconsin to Florida. Owing to the success of the exhibit it was proposed to hold a state wide tobacco show at some future time.

An enthusiastic meeting of the tobacco organization was held during the show. This meeting was attended by some 200 growers many of whom were not memebers but simply attending the exhibit. It was announced that the findings of the joint committee of this and the local dealers' association relative to the best methods of tobacco culture would be published soon. A matter of far greater interest, however, was the presence of Mr. Kimbrough, the organizer, and the presentation of some of his plans to aid the grower. He said that farmers must organize and suggested his plan of establishing warehouses and appointing sales agents. He outlined the organization methods of the burley section of Kentucky and Ohio and stated that growers there received $15 to $18 per cwt. for tobacco that, had they not been organized, would have sold at $6 per cwt. He said that, in time, the Seed Leaf Tobacco Growers' Company will be organized and launched after which he will, if desired, cease further activities.—H. E. Tweed, Feb. 16, 1914.



The New Edison Phonograph

Mr. Edison's *Latest* Invention

Now Shipped

FREE

An offer introducing ***The New Edisons.*** Write quick—*while this offer lasts.* Edison's new phonograph—*just out!*—the perfected musical wonder of the age!

WRITE *today* for our *new* Edison catalog—that tells you all about the wonderful *new* model Edison and **our *new* Edison offer!**

Hear the latest up-to-date song hits of the big cities. Laugh until the tears stream down your face and your sides ache from laughing at funniest of funny minstrel shows; hear the grand old church hymns, the majestic choirs, the pealing organs, the splendid operas, the crushing brass bands, the waltzes, the two steps, the solos, comic vaudeville, duets and quartettes. Take your choice of any kind of entertainment. All will be yours with the Edison in your home

MR. EDISON'S PET AND HOBBY

Among all his wonderful inventions is his phonograph. He worked for years striving to produce the most perfect phonograph. At last he has produced this new model. Think of it; over 25 years of work on all these epoch-making inventions—then his pet and hobby perfected!

The Offer:

We will send you the *new* model Edison phonograph and your choice of all the brand new records on an **absolutely free loan.** We want you to hear all the waltzes, two-steps, vaudevilles, minstrels, grand operas, the old sacred hymns, every kind of comic and popular music, also your choice of the highest-grade concerts and operas, as rendered by the world's greatest artists. Entertain your family and friends. *Then, when you are through with the outfit, you may send it back at our expense.*

REMEMBER, not a penny down—no deposit—no guarantee—no C. O. D. to us—no obligations to buy—*a full free trial in your own home—direct from us—direct to you.* Returnable at our expense or payable (if you want to keep it) at the rock-bottom price direct from us.

The Reason: We are tremendously proud of this magnificent new instrument. When *you* get it in your town we *know* everybody will say that nothing like it has ever been heard—so we are pretty sure that at least some one, if not you, then somebody else, will want to buy one of these *new style Edisons, especially as they are being offered now at the most astounding rock-bottom price and on easy terms as low as a few dollars a month.*

Our *New* Edison Catalog Sent *Free*

Your name and address on a postal or in a letter (or just the coupon) is enough. No obligations in asking for the catalog. Get this offer—*while this offer lasts.* Fill out the coupon now—today.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. When reply by mail is requested, it becomes private practice and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Worms—Thick Urine.—I have a five year-old horse that shows symptoms of worms. His urine is thick and yellow in color. E. F., Pittsfield, Pa.—Mix together equal parts by weight powdered sulphate iron, powdered nitrate of potash, ground gentian, fenugreek and cooking soda. Give him a tablespoonful at a dose in feed, 3 times a day for 30 days.

Diabetes.—I have a horse that is about 10 years old. His kidneys are not right and for the past two months I have been treating him, giving him remedies prescribed by my neighbors. He does not improve. His urine is nearly white, having much the appearance of lime water. H. C. W., Elmer, N. J.—Give him 2 dr. potassium iodide at a dose in feed 3 times a day for a week; then give a teaspoonful of powdered nitrate of potash and a tablespoonful of powdered rosin at a dose, 2 or 3 times a day for a week. Then give the medicine as often as you believe it necessary to keep the kidneys active. A change of feed and regular daily exercise would doubtless have a good effect.

Flat Fore Feet.—I have a 10-year-old mare that has flat fore feet; besides, her hoofs are very hard. About a year ago she commenced to show tenderness in one fore foot and seemed to be worse when driven on hard roads. This is a good useful mare and I would like her made well. H. A. K., Springvale, Pa.—First of all, let me say that a flat foot is usually a weak one; both wall and sole being somewhat thin, the foot is easily bruised. For this reason it is always good practice to apply a wide-webbed shoe. Sometimes it is necessary to put on a bar shoe and very often it is helpful to apply a leather sole with some tar and oakum between leather and sole. This sort of shoeing usually protects the bottom of foot from becoming bruised or punctured. A very good external application to hoof is lanolin (wool fat) and it should be applied daily. The growth of horn will be hastened by applying cerate of cantharides to coronet, 3 or 4 times a month.

Navicular Disease—Sweeney.—I have been a reader of your paper for sometime and like it very much. Last summer I traded for a 1,200 pound lame horse. The lameness was in left fore leg and I blistered shoulder twice. Some time later I had a veterinarian put in seatons in the shoulder, as he thought the whole trouble was sweeney. This treatment does not appear to do him any good. It is my opinion that the soreness is in foot, because he is inclined to stand pretty straight on pastern and dislikes to let heel down. He travels best when shod with high heeled shoes. G. M., Hogestown, Pa.—I am inclined to believe this a case of coffin joint lameness. The horse will be benefited by applying 1 part red iodide mercury and 8 parts cerate of cantharides to coronet every 10 days. The sweenied part of shoulder should be clipped. Then apply 1 part powdered cantharides and 6 parts fresh lard every week or 10 days.

Lice on Cow.—I bought a cow two months ago and now find that she has lice. I have been grooming her with a comb and brush which are kept in the same box with the grooming tools that I use on my horses. This cow is due to come fresh the latter part of this month and is now giving four quarts of milk daily. I am feeding her equal portions of wheat bran, middlings, ground oats and alfalfa meal, moistened with water and a little salt added. Of course she has all the course fodder she will eat, besides her grain. D. A. H., Woodbury, N. J.—If you will drop 5 oz. of crushed stavesacre seed in a gallon of boiling water and keep it boiling gently for two hours, then strain and fill to original gallon by adding water, then apply to cow 2 or 3 times, you will kill every louse on her and not injure her. But killing the lice on the cow, does not kill those that are in your brushes, stall walls and litter about the stable. Spray the walls and saturate grooming utensils with a mixture of 1 part carbolic acid and 30 parts water. This should be done two or three times.

Trees Grow Faster in Blasted Holes

Trees planted in blasted holes averaged 1207 inches new growth the first year; trees in spade-dug holes grew only 555 inches, the New Jersey Experiment Station found. You get bearing orchards two years sooner and have bigger, thriftier, stronger-rooted trees when you plant them in holes blasted with

Atlas Farm Powder
THE SAFEST EXPLOSIVE

A small charge digs the hole and breaks up the subsoil for several feet in every direction, putting it in condition to promote rapid growth. It costs less than hand-digging, and is easy, and efficient—does its work instantly.

Atlas Farm Powder is made especially for farm purposes and is sold by dealers near you. It is safe, convenient, and most economical for you to use in planting your trees, blasting stumps and clearing land, digging ditches, etc.

Send Coupon for "Better Farming" Book FREE

Our valuable new book, "Better Farming," tells how to regenerate old orchards, how to plant new orchards most successfully, how to increase the fertility of the land, and how to do many kinds of work with Atlas Farm Powder. Get it now—mail the coupon.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXII (concluded)

"Pride of my own folly has put it out of my power to denounce you without abandoning what I have set my heart upon, and after all it is not my business," he said. "I will give you five hundred dollars and you can go to Chicago or Montreal and consult a specialist. If the money is exhausted before I send for you, I will pay your hotel bills, but every dollar will be deducted when we come to the reckoning."

Courthorne laughed a little. "You had better make it seven fifty. Five hundred dollars will not go very far with me."

"Then you will have to husband them," said Winston dryly. "I am paying you at a rate agreed upon for the use of your land and small bank balance behind me, and want all of it. The rent is a fair one in face of the fact that a good deal of the farm consisted of virgin prairie, which can be had from the Government for nothing."

He said nothing further, and soon after he went out Courthorne went to sleep, but Winston sat by an open window with a burned-out cigar in his hand staring at the prairie while the night wore thru, until he rose with a shiver in the chill of early morning to commence his task again.

A few days later he saw Courthorne safely into a sleeping car with a ticket for Chicago in his pocket, and felt that a load had been lifted off his shoulders when the train rolled out of the little prairie station. Another week had passed when, riding home one evening, he stopped at the Grange, and, as it happened, found Maud Barrington alone. She received him without any visible restraint, but he realized that all that had passed at their last meeting was to be tacitly ignored.

"Has your visitor recovered yet?" she asked.

"So far as to leave my place, and I was not anxious to keep him," said Winston, with a little laugh. "I am sorry he disturbed you."

Maud Barrington seemed thoughtful. "I scarcely think the man was to blame."

"No?" said Winston.

The girl looked at him curiously and shook her head. "No," she said. "I heard my uncle's explanation, but it was not convincing. I saw the man's face."

It was several seconds before Winston answered, and then he took the bold course.

"Well?" he said.

Maud Barrington made a curious little gesture. "I know I had seen it before at the bridge, but that was not all. It was vaguely familiar and I felt I ought to know it. It reminded me of somebody."

"Of me?" and Winston laughed.

"No. There was a resemblance, but it was very superficial. That man's face had little in common with yours."

"These chance likenesses are not unusual," said Winston, and once more Maud Barrington looked at him steadily.

"No," she said, "of course not. Well, we will conclude that my fancies ran away with me, and be practical. What is wheat doing just now?"

"Rising still," said Winston, and [illegible] the sincerity with which he had seized the opportunity of changing the theme, when he saw that it had not escaped the notice of his companion. "You and I and a few others will be rich this year."

"Yes, but I am afraid some of the rest will find it [illegible] only further anxieties for them."

"I know," said Winston. "You are thinking of [illegible]."

Maud Barrington nodded. "Yes. I am still afraid."

"Then it would please you if I tried to straighten out things for him? It would be difficult, but I believe it could be accomplished."

Maud Barrington's eyes were grateful, but there was something that Winston could not fathom behind her smile.

"If you undertook it, one could almost believe you had the wonderful gift," she said.

Winston smiled somewhat dryly. "Then all its virtues will be tested to-night, and I had better make a commencement while I have the courage. Colonel Barrington is in?"

Maud Barrington went with him to the door, and then laid her hand a moment on his arm. "Lance," she said, with a little tremor in her voice, "if there was a time when our distrust hurt you, it has recoiled upon our heads. You have returned it with a splendid generosity."

Winston could not trust himself to answer, but walked straight to Barrington's room, and finding the door open went quietly in. The head of the Silverdale settlement was sitting at a littered table in front of a shaded lamp, and the light that fell upon it showed the care in his face. It grew a trifle grimmer when he saw the younger man.

"Will you sit down?" he said. "I have been looking for a visit from you for some little time. It would have been more fitting had you made it earlier."

Winston nodded as he took a chair. "I fancy I understand you, but I have nothing that you could expect to hear to tell you, sir."

"That," said Barrington, "is unfortunate. Now, it is not my business to pose as a censor of the conduct of any man here, except when it effects the community, but their friends have sent out a good many young English lads, some of whom have not been too discreet in the old country, to me. They did not do so solely that I might teach them farming. A charge of that kind is no light responsibility, and I ask for assistance from the men who have almost as large a stake as I have in the prosperity of Silverdale."

"Have you ever seen me do anything you could consider prejudicial to it?" asked Winston.

"I have not," said Colonel Barrington.

"And it was by her own wish Miss Barrington, who, I fancy, is seldom mistaken, asked me to the Grange?"

"It is a good plea," said Barrington. "I cannot question anything my sister does."

"Then we will let it pass, tho I am afraid you will consider what I am going to ask a further presumption. You have forward wheat to deliver, and find it difficult to obtain it?"

Barrington's smile was somewhat grim. "In both cases you have surmised correctly."

Winston nodded. "Still, it is not mere inquisitiveness, sir. I fancy I am the only man at Silverdale who can understand your difficulties, and what is more to the point, suggest a means of obviating them. You still expect to buy at lower prices before the time to make delivery comes?"

Again the care crept into Barrington's face, and he sat silent for almost a minute. Then he said, very slowly, "I feel that I should resent the question, but I will answer. It is what I hope to do."

"Well," said Winston, "I am afraid you will find prices higher still. There is very little wheat in Minnesota this year, and what there was in Dakota was cut down by hail. Millers in St. Paul and Minneapolis are anxious already, and there is talk of a big corner in Chicago. Nobody is offering grain, while you know what land lies fallow in Manitoba, and the activity of their brokers shews the fears of Winnipeg millers with contracts on hand. This is not my opinion alone. I can convince you from the papers and market reports I see before you."

Barrington could not controvert the unpleasant truth he was still endeavoring to shut his eyes to. "The demand from the East may slacken," he said.

Winston shook his head. "Russia can give them nothing. There was a failure in the Indian monsoon, and South American crops were small. Now, I am going to take a further liberty. How much are you short?"

Barrington was never sure why he told him, but he was hard pressed then, and there was a quiet forcefulness about the younger man that had its effect on him.

"That," he said, holding out a document, "is the one contract I have not covered."

Winston glanced at it. "The quantity is small. Still, money is very scarce and bank interest almost extortionate just now."

Barrington flushed a trifle, and there was anger in his face. He knew the fact that his loss on this sale should cause him anxiety was significant, and that Winston had surmised the condition of his finances tolerably correctly.

"Have you not gone quite far enough?" he said.

Winston nodded. "I fancy I need say no more, sir. You can scarcely buy the wheat, and the banks will advance nothing further on what you have [illegible] at Silverdale. It would be perilous to put yourself in the hands of a mortgage broker."

Barrington stood up very grim and straight, and there were not many men at Silverdale who would have met his gaze.

"Your content is a little too apparent, but I can still resent an impertinence," he said. "Are my affairs your business?"

"Sit down, sir," said Winston. "I fancy they are, and had it not been necessary, I would not have ventured so far. You have done much for Silverdale, and it has cost you a good deal, while it seems to me that every man here has a duty to the head of the settlement. I am, however, not going to urge that point, but have, as you know, a propensity for taking risks. I can't help it. It was probably born in me. Now, I will take that contract up for you."

Barrington gazed at him in bewildered astonishment. "But you would lose on it heavily. How could you overcome a difficulty that is too great for me?"

"Well," said Winston, with a little smile, "it seems I have some ability in dealing with these affairs."

Barrington did not answer for a while, and when he spoke it was slowly. "You have a wonderful capacity for any one to believe in you."

"That is not the point," said Winston. "If you will let me have the contract, or, and it comes to the same thing, buy the wheat it calls for, and if advisable sell as much again, exactly as I tell you, at my risk and expense, I shall get what I want out of it. My affairs are a trifle complicated and it would take some little time to make you understand how this would suit me. In the meanwhile you can give me a mere I O U for the difference between what you sold at, and the price today, to be paid without interest and whenever it suits you. It isn't very formal, but you will have to trust me."

Barrington moved twice up and down the room before he turned to the younger man. "Lance," he said, "when you first came here, any deal of this kind between us would have been out of the question. Now, it is only due to tell you that I have been wrong from the beginning, and you have a good deal to forgive."

"I think we need not go into that," said Winston, with a little smile. "This is a business deal, and if it hadn't suited me I would not have made it."

He went out in another few minutes with a little strip of paper, and just before he left the Grange placed it in Maud Barrington's hands.

"You will not ask any questions, but if ever Colonel Barrington is not kind to you, you can show him that," he said.

He had gone in another moment, but the girl, comprehending dimly what he had done, stood still, staring at the paper with a warmth in her cheeks and a mistiness in her eyes.

(To be continued.)

AN EDITOR ON DUTY

Most anybody can be an editor, says the Boston Globe. All an editor has to do is to sit at his desk six days in the week, four weeks in the month, and twelve months in the year, and "edit" stuff as this:

"Mrs. Jones, of Lone Creek, let a can opener slip, last week, and cut herself in the pantry."

"A mischievous lad of Bungtown threw a stone and struck a companion in the alley last Tuesday."

"Joe Doe climbed on the roof of the house, last week, looking for a leak, and fell, striking himself on the back porch."

"While Harold Green was escorting Miss Violet Wise from a church social, last Saturday night, a savage dog attacked them and bit Mr. Green on the public square."

"Isaiah Trimmer, of Lebanon, was playing with a cat, Friday, when it scratched him on the veranda."

"Mr. White, while harnessing a broncho, last Saturday, was kicked just south of the corncrib."

Corn Is Our Greatest Crop
It is worth more than any other crop
It costs more than any other crop

A big item in this cost is over one hundred million dollars' worth of actual potash, which the corn crop takes from American soils every year—more than eight times the total importations of

POTASH

The corn plant uses over a pound and a quarter of potash for every bushel of ears produced.

It uses more than twice as much potash as phosphoric acid.

Supplement the manure or clover sod by 400 to 600 lbs. per acre of a fertilizer containing at least as much potash as phosphoric acid—0-8-8 or 0-8-10—or broadcast 300 lbs. acid phosphate and 100 lbs. muriate of potash per acre after plowing and before harrowing, and drill in with the seed 100 lbs. per acre 2-8-8 goods. On muck lands broadcast 100 to 200 lbs. muriate of potash per acre.

To drive away cut worms and root lice, drill in 100 lbs. Kainit per acre with the seed. Potash makes more sound ears in proportion to the stalks. It makes much more and much better corn for either crib or silo. **Potash Pays.**

We sell potash in any amount from one 200-lb. bag up.

Write for prices and for free pamphlet on profitable use of fertilizers.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., Feb. 16, 1914.

Receipts of fancy print butter well cleaned up at top prices. Eggs were firm due to an expected falling off of receipts on account of present stormy weather. The demand was sufficient to absorb the limited receipts of fancy poultry stock. Fruits and vegetables show moderate offerings and firm prices.

Butter.—Western creamery, 31c; extras, 29c; firsts to seconds 25@27½c; special prints 35@38c; near-by prints, 32c.

Eggs.—Candled, 32@34c doz; extras, 30c. Current receipts at $8.10 per standard case.

Poultry.—Fowls, 19@20c; old roosters, 12@13c; pigeons, 25@30c pair.

Dressed Poultry.—Western fowls, 12@18c; roosters, 14½c; turkeys, 20@26c; squabs $2@4.85 doz.

Vegetables.—White potatoes, Pa., 70@85c bu. Onions, $2.75@3 per 100-lb bag. Peppers $2@2.25 per carrier. Eggplant $2.50@4.00 per crate. Lettuce $1@2.50 hamper. Beets, new 5@8c bch. Sweet potatoes, 40@55c bas. String beans, $2.00@3.50 hamper. Squash, $1.50@2.00 box. Cucumbers, Florida $4@6 hamper. Celery, 50@65c per doz. stalks. Cabbage, new $1.50@$2 ½-bbl crate. Cauliflower, $1.50@1.75 hamper.

Fruit.—Apples $3.50@6 bbl. Pineapples, per crate, $2.50@3.50. Pears, 50@75c bas. Grapes $4@7 keg; cranberries, $2.50@3.50 crate; lemons, $2.50@4 per box; grape fruit $2@4 per box; oranges, $2@3 per box.

Hay and Grain.—No. 3 hay, large bales, $17.50@18.00; No. 1 medium, $17@17.50; no grade, $10.00@12.00. Clover mixed hay, light mixed at $16.00@16.50. Straw No. 1 new straight rye, $16.50; No. 2 do., $15@15.50; No. 1 tangled rye straw new $12; No. 2 do., $11.00@11.50; No. 1 wheat straw, $9.50@10.00; No. 1 oat straw, $10.50@11.00; new shelled corn No. 2 yellow, 71½@72½c. Wheat, No. 2 red, 98@98½c No. 1 Northern, $1.03@1.04; No. 2 white oats, 45@45½c; No. 3, white, 45@45½c. Standard white, 44½@45c.

Coffee.—Rio 7s 9½c; Santos 4s 12⅛c. Mild Coffee.—Cordova, 13@16c.

Sugar.—Cut loaf, $5.10 cwt.; cubes, $4.35; powdered, $4.20; granulated, $4.10; standard granulated, $4.15; crystal A, $4.10.

Flour.—For 196 lbs. in wood, winter-clear, $3.75@4.00; do straight, $4.20@4.40; favorite brands, $4.75@5.15; rye flour, Pa., $3.50@3.60 per bbl.

Hides and Skins.—Steers, abattoir, 16¾@17¾c; do country, 15c. Cows, country, 15c. Bulls, abattoir, 14½c; do. country, 13c. Calf skins, Nos. 5 to 12 and up, $1.55@2.75; do. green, 14@15c.

NEW YORK PRODUCE

New York City, Feb. 16, 1914.

With a short supply butter values are higher. Owing to the recent stormy weather egg prices are rather irregular altho there is a fairly well established advance. There is little demand for poultry, and receipts are rather light. Cold weather conditions have made uncertain values in fruits and vegetables.

Eggs.—State and near-by hennery whites, fine to fancy, 39@40c; gathered whites, 39c; fair to good 37@38c; no grades, 34@36c; fresh gathered, firsts to extras, 30@31c; seconds to thirds, 26@29½c; no grades 20@23c; mixed 30@31c.

Butter.—Creamery, firsts to extras, 28@32c; thirds to seconds, 21½@27c; state dairy 20@22c; packing stock 16@19½c; process 20@23c.

Cheese.—Whole milk specials, 18@18½c do. common to fancy, 14½@17¾c; skims 5@14¼c.

Dressed Poultry.—Turkeys, dry, 23@25c; chickens, 14@25c; fowls, 12@18½c; old roosters, 13½c; ducks 10@16c.

Live Poultry.—Prices not settled.

Vegetables.—Cabbage, $22.00@26.00 ton. Green beans, $1.50@4.50 bas. Carrots $1.75@2 bag. Cucumbers, $1@$2 doz. Lettuce 50c@$4 basket. Squash, $2.25@3 bbl. Celery, $1.50@4.00 per stan. case. Onions $2.75@3 100-lb bag. Tomatoes, $1.00@4.00 carrier. Peppers $2@2.75 per carrier. Beets, $3@5 per 100 bunches. Potatoes, $1.75@5.50 bbl. Sweet potatoes, $1.50@2.00 bbl. Eggplants, $2.50@3.50 box. Cauliflower $1.00@1.75 bas.

Fruit.—Apples, $2.00@6.00 bbl. Cranberries $9@13.50 bbl. Pears, $2@3.75 bbl.

Grain.—Wheat No. 2, red $1.02; No. 1, Northern, $1.04¾; corn, new No. 3 yellow, 69¾c; oats, standard white 45@45½c.

PHILADELPHIA LIVE STOCK

Beef Cattle.—The market shows a better tone and choice steers brought good prices. Lancaster, Pa., and Ohio cattle were principally in evidence. The better class of cows as well as the most desirable calves closed a fraction firmer.

	Beef Cattle	Sheep and Lambs	Hogs
Total for week	3,934	8,358	4,948
Previous week	2,575	8,291	5,839

Best Steers	$8.80@9.00
Choice steers	8.60@8.75
Good	8.40@8.50
Medium steers	8.00@8.25
Common steers	7.50@7.75
Bulls	5.25@6.85
Fat Cows	6.20@7.00
Medium cows	4.75@5.75
Thin cows	3.00@4.50
Milk cows	45.00@75.00

Veal calves steady to firm.

Best calves	$11.50@12.25
Good to choice do	10.50@11.00
Medium	7.50@8.00
Common do.	5.00@8.00

Sheep and Lambs.—There was a fair disposal of stock with the best lambs a trifle easier.

Choice wethers	5.75@6.00
Good do.	5.00@5.25
Common to medium	3.00@4.25
Ewes, fat	5.00@5.50
Extra lambs	8.25@8.50
Good to choice, do.	8.00@8.25
Common to medium	5.50@8.00

Hogs.—The market closed firm at the prices with a good absorption of arrivals. Western, as to size and quality $12.50@12.75.

City Dressed Stock.—Every kind of choice and prime meat commanded full values, with trade normal. Steers, 11@13½c; heifers, 10½@13c; cows, 8@11c. Veal calves, 14@15c; country dressed calves, 14@15c; extra do., 15½c. Sheep, 9@11c; extra wethers, 12c. Spring lambs 13@14c. Hogs 12¾@13c.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., Feb. 16, 1914.

Cattle.—With only a supply of 75 loads compared with 100 loads the previous week and a good demand the market ruled 10 to 25 cents per cwt. higher. The light and medium grades sold at the most of the advance. Several buyers for weighty cattle were in the market and the good weight cattle sold from $8.90 to $9.15. The quality of the cattle on sale this week was better than last week. Heifers, fat cows and bulls were in demand and sold at about the same advance as steers. Fresh cows and springers slow and lower. With 125 loads on sale this morning, the demand was moderate, and the market slow and lower on all grades.

Good to choice	$8.90@9.00
Good 1,300-1,400 lb	8.30@8.70
Medium to good 1,200-1,300 lb.	8.10@8.35
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900-1,100 lb	7.60@8.00
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700-900 lb.	5.50@6.50
Common to good fat bulls	5.00@7.50
Common to good fat cows	4.00@6.50
Heifers	5.50@7.75
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@90.00

Calves.—Receipts of calves fair and with good demand market closed 50 cents higher than Monday's prices. With 400 head on sale, today's calf market was steady.

Heavy and thin calves	$5.50@8.00
Veal calves	8.50@12.00

Sheep and Lambs.—The supply of sheep and lambs has been fair; with a good demand sheep ruled steady to strong, while the demand for lambs has not been so good and the close for the week was 15c per cwt. below Monday's prices. The demand for sheep today was only fair, tho the market was steady. Lambs were lower.

Prime wethers	$6.10@6.25
Good mixed	5.40@5.65
Fair mixed ewes and wethers	4.25@5.00
Culls to common	3.00@3.50
Spring lambs	5.50@8.00

Hogs.—The supply of hogs has been liberal; the market ruled steady during the early part of the week but the close for the week was 10 cents lower on all grades. Today's hog market was steady with 55 double-deck loads on sale.

Prime heavy	$9.10@
Prime medium weights	9.10@
Heavy mixed	9.15@
Best heavy Yorkers	9.15@
Light Yorkers	9.15@
Pigs	9.00@9.05
Common to good roughs	7.75@8.35
Stags	6.75@7.25

BUFFALO LIVE STOCK

Buffalo, N. Y., Feb. 16, 1914.

Cattle.—The cold weather and the active opening of the week restricted receipts and put the market in good condition on choice butcher grades. On the close the basis was unchanged. The supply was light and the market firm at the week's opening figures. Today's receipts were fairly liberal, totaling 3,750 head. The market was active and stronger.

Choice heavy steers	$9.00@9.25
Medium	8.25@8.75
Yearlings	8.00@8.50
Handy butchers	7.50@8.50
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.50@8.00
Butcher bulls	6.00@7.50
Feeders	6.25@7.00
Stockers	5.00@6.25
Cows and springers	35.00@85.00

Calves.—The trade was fair during the week with moderate receipts. The opening basis was $11@12 for choice veals. On the close the supply was light, the demand good and the market 50@75c higher. All grades were firm and the basis $12.50@13 on choice. With 800 head on sale, today's market was steady.

Choice veals	$12.50@13.00
Lights and thin	6.00@8.75

Sheep and Lambs.—The trade opened fair considering the liberal receipts and the demand was generally good for choice lambs; yearlings were scarce and sold higher during the week. The basis was $6@7.35. On the close the market was steady with liberal offerings. The best lambs brought $7.75@8. Yearlings were in fair demand and easy—the best brought $6.75@7. Choice handy sheep were firm. Wethers firm at $6@6.25. Today's run of 20,000 head was heavy but the market was generally steady to 25c higher.

Choice lambs	$8.00@8.25
Yearlings	7.00@7.25
Wethers	6.25@6.40
Ewes	5.75@6.00
Sheep	6.00@6.25

Hogs.—The active opening of the week put the market in fair shape, owing principally to the cold weather. York weights were firm and heavies were firm and higher. On the close the demand was light and the market 20@30c lower. City and country buyers took but a moderate number. Common grades were slow and lower. The basis on Yorkers was $9.05@9.10. Receipts this morning numbered 20,000 head. The market was steady to higher.

Heavies	$9.00@9.15
Mixed and medium	9.15@9.20
Yorkers	9.15@9.20
Light Yorkers	9.15@9.20
Pigs	9.15@9.20
Roughs	8.00@8.25
Stags	6.50@7.50

Horses.—The supply was fair, 600 head. Fair demand for choice heavy work teams. Best young, well matched, heavy teams, $650@700; medium, $500@600.—S.

NEW YORK MILK MARKET

The condition in the milk market was complicated last week by the heavy snow storm. Delayed trains on Sunday and Monday caused a shortage on the latter day of more than 5,000 cans. The farmers in some cases could not get their milk thru the drifts to the railroads and some of the roads, the New York Central Lines in particular, had great difficulty in moving their trains. Some of the big companies, the Borden and the Sheffield Farms in particular, were unable to supply all their customers and there was a shortage of certified milk for the babies. The February demand is normal, but the supply far exceeds it. It is expected that delinquents in the pasteurization of their supplies will soon find at the hands of the Board of Health how unsatisfactory it is to fail to take time by the forelock. Receipts of milk and cream in 40-qt. cans for the week ending February 14, were as follows:

Railroad	Milk	Cream
Erie	43,298	1,757
Susquehanna	9,475	546
West Shore	15,750	712
Lackawanna	51,675	1,290
N. Y. Central (long haul)	78,003	1,274
N. Y. Central (short haul)	11,570	86
Ontario	41,905	3,138
Lehigh Valley	36,984	886
Homer Ramsdell Line	3,350	25
New Haven	8,690	112
Pennsylvania	2,450	350
Other sources	1,655	14
Total	304,805	10,190

BALTIMORE LIVE STOCK

Baltimore, Md., Feb. 16, 1914.

Cattle.—Receipts for the week, 1,494 head against 2,408 last week.

Steers	$6.25@8.55
Heifers	5.50@7.25
Cows	3.00@6.25
Bulls	5.25@7.00
Fresh Cows	35.00@88.00

Sheep and lamb receipts for the week were 2,196 head against 4,470 last week. Fair supply; market steady.

Sheep	$3.50@6.25
Lambs	5.75@8.45

Hog receipts for the week were 13,930 head against 15,549 last week.

Light Western	$9.50@9.55
Heavy to medium	9.35@9.40
Near-by	9.25@9.40
Pigs	9.00@9.25

Calves.—Receipts for the week were 308 head, against 219 head last week. Fair supply, market higher at $6.50@11.50.

ELGIN BUTTER QUOTATION

Elgin, Ill., Feb. 16, 1914.

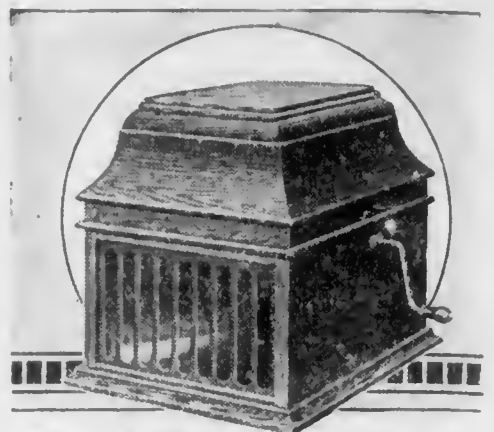
The quotation committee of the Elgin Board of Trade this afternoon declared butter firm at 30c.

TOBACCO MARKET

The sale of the new crop continued in a very limited way, several of the larger concerns having withdrawn their buyers and local packers waiting for lower prices. With the present improved conditions these packers may not realize their hopes. Some communities sold a part of their crop as follows: Manor Township 300 acres at $8@9; Leacock township one-third of crop at $8@9.50; West Lampeter, one-half of crop at $8.50@10; Rohrerstown, small sales at $9@10; Conestoga, one-half of crop at $8@10.50; Gap, large sales at $8@9 per cwt. At East Lampeter not much is sold and the same is true at Quarryville, Paradise and Ephrata.

The tobacco and corn show held under the direction of the Lancaster County Tobacco Growers' Association was a great success. The entries in all classes were numerous and worthy. Following are prize winners: Broadleaf filler—First, Geo. Hibshman; second, J. A. Herr; third, H. K. Landis. Broadleaf binder—First, L. H. Gochenauer; second, J. J. High; third, C. Mellinger. Broadleaf wrapper—First, Wayne Hartman; second, L. H. Gochenauer; third, J. S. Reynolds. Havana wrapper—First, M. H. Good; second, A. S. Shaubach; third, M. H. Good. An interesting feature of the show was an exhibit of some fifty samples of tobacco grown in various parts of the country from Wisconsin to Florida. Owing to the success of the exhibit it was proposed to hold a state wide tobacco show at some future time.

An enthusiastic meeting of the tobacco organization was held during the show. This meeting was attended by some 200 growers many of whom were not memebers but simply attending the exhibit. It was announced that the findings of the joint committee of this and the local dealers' association relative to the best methods of tobacco culture would be published soon. A matter of far greater interest, however, was the presence of Mr. Kimbrough, the organizer, and the presentation of some of his plans to aid the grower. He said that farmers must organize and suggested his plan of establishing warehouses and appointing sales agents. He outlined the organization methods of the burley section of Kentucky and Ohio and stated that growers there received $15 to $18 per cwt. for tobacco that, had they not been organized, would have sold at $6 per cwt. He said that, in time, the Seed Leaf Tobacco Growers' Company will be organized and launched after which he will, if desired, cease further activities.—H. E. Tweed, Feb. 16, 1914.



The New Edison Phonograph

Mr. Edison's *Latest* Invention

Now Shipped

FREE

An offer introducing *The New Edisons.* Write quick—*while this offer lasts.* Edison's new phonograph—*just out!*—the perfected musical wonder of the age!

WRITE *today* for our *new* Edison catalog—that tells you all about the wonderful *new* model Edison and **our *new* Edison offer!**

Hear the latest up-to-date song hits of the big cities. Laugh until the tears stream down your face and your sides ache from laughing at funniest of funny minstrel shows; hear the grand old church hymns, the majestic choirs, the pealing organs, the splendid operas, the crashing brass bands, the waltzes, the two steps, the solos, comic vaudeville, duets and quartettes. Take your choice of any kind of entertainment. All will be yours with the Edison in your home

MR. EDISON'S PET AND HOBBY

Among all his wonderful inventions is his phonograph. He worked for years striving to produce the most perfect phonograph. At last he has produced this new model. Think of it; over 25 years of work on all these epoch-making inventions—then his pet and hobby perfected!

The Offer:

We will send you the *new* model Edison phonograph and your choice of all the brand new records on an **absolutely free loan.** We want you to hear all the waltzes, two-steps, vaudevilles, minstrels, grand operas, the old sacred hymns, every kind of comic and popular music, also your choice of the highest-grade concerts and operas, as rendered by the world's greatest artists. Entertain your family and friends. *Then, when you are through with the outfit, you may send it back at our expense.*

REMEMBER, not a penny down—no deposit—no guarantee—no C. O. D. to us—no obligations to buy—*a full free trial* in your own home—*direct* from us—*direct* to you. Returnable at our expense or payable (if you want to keep it) at the rock-bottom price direct from us.

The Reason: We are tremendously proud of this magnificent new instrument. When *you* get it in your town we *know* everybody will say that nothing like it has ever been heard—so we are pretty sure that at least some one, if not you, then somebody else, will want to buy one of these *new style* Edisons, *especially as they are being offered now at the most astounding rock-bottom price and on easy terms as low as a few dollars a month.*

Our *New* Edison Catalog Sent *Free*

Your name and address on a postal or in a letter (or just the coupon) is enough. No obligations in asking for the catalog. Get this offer—*while this offer lasts.* Fill out the coupon now—today.

SAVE-THE-HORSE
(Trade Mark Registered.)

THE TIME IS NOW

All the winter long, the troubled owner of a lame horse reads our advertisements. Then, day after day slips away, while he talks, laments, listens, takes advice and hesitating—FAILS TO ACT—till the Springtime is on him and his horse is not yet able to work. Meantime the thrifty, prosperous, resolute man, reads, considers the evidence carefully—Decides Promptly—and his horse is working in, say, ten days to two weeks. That's exactly what happens every winter.

We Originated the treatment of horses by mail—Under Signed Contract to Return Money if Remedy Fails—and every minute of every day for Eighteen Years our advice and treatments have been on the way wherever mails go and horses are. Our charges are moderate. Spring work is near; Write.

(Our Latest Save-The-Horse BOOK is a Mind Settler—Tells How to Test for Spavin—What to Do for a Lame Horse—Covers 58 Forms of Lameness—Illustrated. But write describing your case and we will send our—BOOK—Sample Contract and Advice—ALL FREE—to (Horse Owners and Managers—Only.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. When reply by mail is requested, it becomes private practice and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Worms—Thick Urine.—I have a five year-old horse that shows symptoms of worms. His urine is thick and yellow in color. E. F., Pittsfield, Pa.—Mix together equal parts by weight powdered sulphate iron, powdered nitrate of potash, ground gentian, fenugreek and cooking soda. Give him a tablespoonful at a dose in feed, 3 times a day for 30 days.

Diabetes.—I have a horse that is about 10 years old. His kidneys are not right and for the past two months I have been treating him, giving him remedies prescribed by my neighbors. He does not improve. His urine is nearly white, having much the appearance of lime water. H. C. W., Elmer, N. J.—Give him 2 dr. potassium iodide at a dose in feed 3 times a day for a week; then give a teaspoonful of powdered nitrate of potash and a tablespoonful of powdered rosin at a dose, 2 or 3 times a day for a week. Then give the medicine as often as you believe it necessary to keep the kidneys active. A change of feed and regular daily exercise would doubtless have a good effect.

Flat Fore Feet.—I have a 10-year-old mare that has flat fore feet; besides, her hoofs are very hard. About a year ago she commenced to show tenderness in one fore foot and seemed to be worse when driven on hard roads. This is a good useful mare and I would like her made well. H. A. K., Springvale, Pa.—First of all, let me say that a flat foot is usually a weak one; both wall and sole being somewhat thin, the foot is easily bruised. For this reason it is always good practice to apply a wide-webbed shoe. Sometimes it is necessary to put on a bar shoe and very often it is helpful to apply a leather sole with some tar and oakum between leather and sole. This sort of shoeing usually protects the bottom of foot from becoming bruised or punctured. A very good external application to hoof is lanolin (wool fat) and it should be applied daily. The growth of horn will be hastened by applying cerate of cantharides to coronet, 3 or 4 times a month.

Navicular Disease—Sweeney—I have been a reader of your paper for sometime and like it very much. Last summer I traded for a 1,200 pound lame horse. The lameness was in left fore leg and I blistered shoulder twice. Some time later I had a veterinarian put in seatons in the shoulder, as he thought the whole trouble was sweeney. This treatment does not appear to do him any good. It is my opinion that the soreness is in foot, because he is inclined to stand pretty straight on pastern and dislikes to let heel down. He travels best when shod with high heeled shoes. G. M., Hogestown, Pa.—I am inclined to believe this a case of coffin joint lameness. The horse will be benefited by applying 1 part red iodide mercury and 8 parts cerate of cantharides to coronet every 10 days. The sweenied part of shoulder should be clipped. Then apply 1 part powdered cantharides and 6 parts fresh lard every week or 10 days.

Lice on Cow.—I bought a cow two months ago and now find that she has lice. I have been grooming her with a comb and brush which are kept in the same box with the grooming tools that I use on my horses. This cow is due to come fresh the latter part of this month and is now giving four quarts of milk daily. I am feeding her equal portions of wheat bran, middlings, ground oats and alfalfa meal, moistened with water and a little salt added. Of course she has all the course fodder she will eat, besides her grain. D. A. H., Woodbury, N. J.—If you will drop 5 oz. of crushed stavesacre seed in a gallon of boiling water and keep it boiling gently for two hours, then strain and fill to original gallon by adding water, then apply to cow 2 or 3 times, you will kill every louse on her and not injure her. But killing the lice on the cow, does not kill those that are in your brushes, stall walls and litter about the stable. Spray the walls and saturate grooming utensils with a mixture of 1 part carbolic acid and 30 parts water. This should be done two or three times.

Trees Grow Faster in Blasted Holes

Trees planted in blasted holes averaged 1207 inches new growth the first year; trees in spade-dug holes grew only 555 inches, the New Jersey Experiment Station found. You get bearing orchards two years sooner and have bigger, thriftier, stronger-rooted trees when you plant them in holes blasted with

Atlas Farm Powder
THE SAFEST EXPLOSIVE

A small charge digs the hole and breaks up the subsoil for several feet in every direction, putting it in condition to promote rapid growth. It costs less than hand-digging, and is easy, and efficient—does its work instantly.

Atlas Farm Powder is made especially for farm purposes and is sold by dealers near you. It is safe, convenient, and most economical for you to use in planting your trees, blasting stumps and clearing land, digging ditches, etc.

Send Coupon for "Better Farming" Book FREE

Our valuable new book, "Better Farming," tells how to regenerate old orchards, how to plant new orchards most successfully, how to increase the fertility of the land, and how to do many kinds of work with Atlas Farm Powder. Get it now—mail the coupon.

"I am sure "Sal Vet" is what you claim. I have a horse that was constantly troubled with colic and worms; he has not been sick since I fed "Sal Vet."—Levi S. Peiffer, Notary Public, Fredericksburg, Pa.

"I am feeding my hogs "Sal Vet" every day, and they are doing finely on it. There is quite a lot of hog cholera around here, but my hogs are thrifty and in good health, and I want to keep them so."—S. I. Steininger, Rt. 1, New Columbia, Pa.

"'Sal Vet' is doing fine work for my hogs. Before feeding it I had lost 38 head of hogs, but since feeding it, I have not lost a single one, and they are looking better than they ever did."—T. C. Corl, Bellefonte, Pa.

"I thought my pigs were all healthy and free from worms, and wanting to keep them so, I sent for "Sal Vet." However, after feeding it a while, one of my sows that was due to farrow in about four weeks, showed signs of worms. These were soon expelled and she came thru with a nice litter of pigs. The rest of my herd all looked a great deal better and picked up, and I have seen no sign of worms since."—Will S. Loffin, Rt. 3, Box 6, Kingsley, Pa.

"One of my young horses would not eat until I gave him "Sal Vet." It not only restored his appetite, but expelled more than a peck of worms from him, and he no longer looks like the skeleton that he did before. I can recommend "Sal Vet" to do more than you claim for it."—Sam'l F. Moyer, Stouchsburg, Pa.

I'll Stop Your Losses From WORMS

The Great LIVE STOCK Conditioner

(140)

is the biggest boon to stock owners ever discovered. It stops losses from worms, prevents disease, aids digestion, tones up the system, helps food do your animals more good, gives them sleek coats, bright eyes and plump bodies. It pays for itself several times over in extra profits and protection against disease. It enables you to feed new corn safely and greatly lessens the danger from hog cholera and other destructive plagues. Read these letters:

"My neighbors lost 25% of their stock from corn fodder and kafir fodder poisoning and altho' I fed the same feed that they did, with the addition of the 'Sal-Vet' which I gave, *I lost none.*" —Frank Frame, Sawyer, Kansas.

"Before I started to feed 'Sal-Vet' my hogs were sick, and I had lost 6 of them; since feeding 'Sal-Vet' *I have lost none.* All now have good appetites and are thriving." —Ernest Triebel, Rt. No. 2, Clearwater, Minn.

"The benefit which my horses, cattle and sheep derived from the use of 'Sal-Vet' is such as to make it almost indispensible." — A. L. Martin, Director of Institutes, Department of Agriculture, Harrisburg, Pa.

Sal-Vet is a medicated salt which expels the deadly stomach and free intestinal worms without bother to you. You place it where your animals can run to it freely and

THEY DOCTOR THEMSELVES

It requires no dosing, no drenching, no starving, no trouble at all. Surely you cannot afford to turn down this opportunity I give you of seeing for yourself on your own farm how Sal-Vet will save and make you money. Remember I don't ask you to send me a cent of money in advance—you have nothing to pay when the shipment arrives except the freight charges. At the end of 60 days report results—tell me what Sal-Vet has done for you. If it fails to do what I claim—if it don't rid your stock of the profit-eating stomach and intestinal worms, I'll cancel the charge—you won't owe me a penny. Send the coupon today.

PENNSYLVANIA FARMER
AGRICULTURE THE KEYSTONE OF NATIONAL PROSPERITY
ESTABLISHED 1880
PUBLISHED WEEKLY

Headle Dr. T. J.
Rutgers College

VOL. 35—No. 9. PHILADELPHIA, PA., SATURDAY, FEBRUARY [illegible] 1914. 2 YEARS FOR $1.00.

Sowing The Seed of Co-operation.

By F. R. STEVENS,
Agriculturist of Lehigh Valley R. R.

Ever since its organization the efforts of this Department have been directed toward the increase of profits for the farmers. Realizing that this could best be done by co-operative enterprises, a good deal of effort has been expended looking toward its formation. It seemed imperative in some way first to increase the quality of the dairy herd and that the best way to accomplish this was by the organization of cow-testing associations. After a considerable effort, this resulted in the early part of 1913 in the formation of the Laurel Hill Cow-Testing Association, located in Bradford County, Pennsylvania.

So great was the indifference of farmers that it was necessary to canvass from East Smithfield to North Orwell, about twenty-five miles, for members for the association. It began work in September 1913 with such favorable results that it now seems probable that in another year there will be several such associations in this territory.

The plan of operation is briefly this: An expert is employed in this association, a graduate of the Pennsylvania College of Agriculture, who spends a day with each herd every month. He weighs and tests the milk of each cow for that day, estimating also the exact cost of her feed. In a book left with the farmer he makes a record of these results, basing product and its cost for a month upon his observations for the one day. At the end of a year the farmer has the data showing what cows have paid a profit and how much and also what cows have been kept at a loss. The minimum expense is $18 a year for those who have fourteen cows or less; for those who have fifteen or more the expense is $1.25 for each cow. No single farmer of that section has a sufficient herd to keep an expert wholly on the matter of feeding cows and determining results, but by co-operation each man now has a record of every cow in his herd and if I am not greatly mistaken there will be some cows for sale around Laurel Hill in a short time.

One such association naturally leads to other associations, or in other words, the scope of co-operative work broadens and as a result of the first the Farmer's Supply Company was organized in the Fall of 1913 and began business December first. It is designed primarily to furnish farmers feed at less than they have been paying. It is capitalized at $5,000, in shares of $25 and one man cannot own more than five. The Company employs, upon a 2 percent commission, an agent who handles the feed and keeps the accounts. Feed is sold, at a small advance over cost, strictly for cash, but it is likely that some arrangement will be made so that time may be given. Anyone may buy, but only stockholders and those who pay an annual fee of $2 may share in the profits which are to be divided quarterly. During the first month the Company sold $2,000 worth of feed, and this would seem to be a good beginning. While organized to handle feed it is likely to become literally a Farmer's Supply Company, and deal in flour, fertilizer, etc., until it sells to its members as near cost as possible, practically all the articles they buy.

And again, this led to a new feature, the establishment of a dairy company. The history of the East Smithfield Dairy Company begins in the last months of 1912, when a new company bought the skimming stations and creameries in this section. These had been owned by two parties and, when another company bought them, the farmers tried to find out how the business was to be conducted. Thru no fault of the real owner, but because of replies by a manager with an unfortunate manner in dealing with farmers, they became dissatisfied with the outlook and organized a company of their own. About 90 men subscribed for stock and some 600 cows were promised for the new enterprise. Early in February the company was organized with an authorized capital of $5,000, of which up to date only $4,000 has been issued, and active work was begun. It was necessary to build and fill an ice house, to erect and equip a creamery and to drill a well that would furnish abundant supply of water. This became a matter of some haste as the farmers interested in the co-operative creamery were required either to withdraw or to cease bringing milk to the other creameries. They would not back down and that meant taking their milk or cream to independent creameries, about seven miles distant. This they did from the middle of February until the middle of May, when their own creamery opened for business.

THE UNPRETENTIOUS BUT BUSY CO-OPERATIVE CREAMERY AT EAST SMITHFIELD, BRADFORD CO., PA., WHICH IS THE CENTER OF A NUMBER OF CO-OPERATIVE MOVEMENTS.

As has been said, the East Smithfield Dairy Company began business the middle of May. The ice house was full, the creamery was completed with up-to-date appliances, and not least of all, there was a flowing well delivering a stream of pure water, 50 degrees Fah. at any point in the creamery without the use of a pump. They expected 600 cows; they began with 900 and now have over 1200. In seven and one-half months they have made 155,619 pounds of butter. They have paid their patrons for butter fat, in excess of highest New York quotations for creamery extras approximately as follows: May, $.037; June, $.033; July, $.035; August, $.044; September, $.042; October, $.036; November, $.05; December, $.05, in the open market; in all, nearly $2,500 more than they would have received at present prices. Out of a charge of three cents per pound for making, they are paying stockholders a dividend of 10 percent, and have in the treasury about $1,200.

Up to the first of January they received for their butter at their railroad station on the Lehigh Valley one cent a pound above New York. For 1914 they sell in Philadelphia at $.015, $.025 and $.03 above New York, according to form of shipment. It is thought that the price will net a half cent better than last year's price and as they will make this year for 2½ cents per pound, patrons will receive about a cent per pound more than in 1913. Below is a partial statement showing amount of business done thus far.

This brief account of the East Smithfield Dairy Company is given with the thought that elsewhere farmers in butter-making sections may be encouraged to do better for themselves. If we add together the $400 paid for interest, the $1200 now in the treasury, and the $2,500 paid to patrons in excess of what they would have received for the same product at other creameries, it is apparent that this Company could have paid to their patrons what they would have received elsewhere and returned to stock-holders the entire investment, and have done it with the profit of seven and one-half months' business. This remarkable showing is due to absolute harmony in the Board of Directors, to the large number of cows and to the unanimous support of patrons.

The scheme of co-operation among farmers is not limited by any means to butter making. It merely happens that in this section, which is a famous butter country, they are working out their salvation as butter makers. Butter making in a way is disappearing from the East. The great cities are requiring the whole milk and the manufacture of butter is largely beyond the zones that supply the milk to the great consuming centers; but the same principles would apply equally well in the making of milk, in the production of hogs, fruit, alfalfa for hay or whatever it may be. The word co-operation seems to be used in discussions of farm subjects more than ever in the history of the world and it is well that it is so. It is also true that under this head many schemes are being advocated which are not practical, which are not for the best interests; but let us keep in sight of the fact that in co-operation alone lies the hope of maximum success. Herein is given one example of how it actually works to great advantage. Thruout the East there are thousands of just such opportunities to bring added profits by working together. Most of us fully appreciate the advantages of such co-operation. What we need is the starting point from which to build.

In Bradford County the logical starting point was the creamery. What is it in your county or community? The following table shows the record of business to January 1, 1914.

	Pounds butter	Price butter fat
Last half of May	12,422	.325
June	31,289	.312
July	28,412	.307
August	22,091	.326

Farm Crop Notes

By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Keep The Farm

As I sit in a hotel office writing this article, two real estate men sit by, swapping experiences and observations and telling of tens of thousands of dollars they have known to be made by men in buying and selling, or operating, timber lands, coal lands, gas and oil wells. These incidents all occurred within the past 25 years. In that time the operators had cleared or pumped the oil wells dry. Altho fortunes have been made, the makers have exhausted the natural resources and can never replace them.

The two men referred to, deplored the fact that opportunities for speculation in that class of property are few and far between. They then voiced the opinion often given by the writer that the next and only great natural resource open for investment is farm land. Mankind must always have the products of the soil. So far as we can now see, the ingenuity of man will never be able to furnish food and clothing from any other source. So, as the population and our necessities increase, farm land will be increasingly better property to have.

Because of the rapid way money was made in these other lines many farmers have sold their farms and invested in other property, or worked for wages at other things. But in the long run, often it has not panned out. In some instances, men are working for day's wages on farms that were once owned by their grandfathers. Farmers are too eager to dispose of their farms, thinking they could do better at something else. In a certain community in one of the northwestern counties of Pennsylvania, forty native farmers have recently sold their farms and homes to as many Bohemian farmers. In driving a distance of eight miles recently, in another county, we found that one half the farms had no one living on them. In both of these instances, the farm land is good and the buildings fair. This country needs and always will need, not only the products of the American farms, but the product of the American farm homes—the boys and girls. Peasants won't do.

Mechanical Condition of Soil

Too many farmers consider only the chemical side of the question of soil improvement, forgetting that the mechanical condition is quite, and often of more importance. If the soil is too wet, or too loose or dry or too hard, no amount of fertilizer will make amends. On the other hand, it is often found that a field has plenty of plant food to produce a good crop when it is brought into good "tilth." It would often pay to invest time, labor and money in putting in drains, adding lime, growing sods and cover crops in order that what we do spend in labor and fertilizer might grow a profit.

Don't Skimp

Do not be stingy in sowing grass seed. It is like "saving at the spigot and losing at the bung hole" to try to economize by reducing the amount of seed per acre because it is high in price, or by doing what is still worse, buying cheap dirty, low-grade seed. The best is not too good.—R. P. K.

For More and Better Corn.

By H. M. ANDERSON, York Co., Pa.

Perhaps many of the Pennsylvania Farmer readers will remember the article by its Editor which appeared in the October 4, 1913, issue describing the activities of the Norrisville Farmers' Club, now the Pen-Mar Agricultural Association, which is incorporated under the laws of Pennsylvania. Knowing that the arousing of local interest in growing and showing corn would materially increase its productiveness and quality, the club decided to conduct a contest among its members during the season just past. Believing that what we have done and propose to do along the line of improving the corn crop will be of interest as well as practical use to a great many of the Pennsylvania Farmer readers, I wish to briefly describe the contest and the corn show which followed in February.

Early last winter a committee consisting of R. W. Anderson, Thomas W. Brown and R. B. McElwain was appointed to arrange a corn growing contest and to draw up, and have printed, a set of rules governing the same. Among other things the rules specified:

"Contestants must all be members of the Pen-Mar Agricultural Association (all farmers and persons interested in agriculture are eligible to election at any regular monthly meeting).

"The test plot shall consist of one-half acre, which need not be picked out or designated by the grower until the judge is ready to measure it.

"Each contestant must advance two dollars, one of which goes to the judge who measures the ground and superintends the harvesting and weighing; the other is added to the prize money.

"Each contestant agrees to have men enough to cut and husk the half acre in 4 or 5 hours."

The judge or judges are appointed by the contest committee and are required to measure and compute the half-acre, weigh the product, take 50 lbs of average ears and shell and weigh corn and cobs and estimate yield of plot in bushels of shelled corn by multiplying the gross weight of ears by the percentage of shelled corn in the 50 lbs. of ears. The association appropriated $25 to which was to be added one dollar from each contestant and the total was to be divided as follows: First prize, 40 percent of total; second prize, 25 percent of total; third prize, 15 percent of total; fourth and fifth prizes, 10 percent of total, each. All contestants were required to register at or before the May meeting.

There were ten members who entered the contest, but two of them, including the writer, found it necessary to drop out owing to circumstances over which they had no control. The other eight contestants produced crops which were measured and weighed by disinterested judges as follows:

		Bu. per A.
1	M. E. Smith	148.36
2	R. W. Anderson	137.22
3	R. B. McElwain	132.12
4	Edgar Metzel	128.71
5	L. M. Brown	127.39
6	John B. Jamison	124
7	Dr. Vallie Hawkins	116.85
8	Thos. W. Brown	101.42

These figures represent estimated actual shelled corn per acre. Four of the contestants selected plots in the main crop where there had been no special fertilizing or cultivating. It should be stated in favor of numbers 7 and 8 that the judge made a mistake in measuring their plots and that this report is based on the second best half acre, also that the chickens had destroyed 15 or more bushels per acre of down corn which does not show in the report. As the value and interest in such reports are based on knowing how such crops are grown, I will describe briefly the growing of the plots that won first and second prizes.

The first prize plot was grown on alfalfa sod, where nine good crops of alfalfa had been cut during the three preceding seasons. The land was comparatively high and level and most of it had no extra fertilizer or manure; there was a good fair coat of good fresh manure and 500 lbs per acre of dissolved rock and kainit. The grower attributes his success, first to seed that had been steadily improved during the last 30 years; second, the alfalfa sod; third, intensive cultivation both before and after the corn was planted.

Plot No. 2 was rather low land but slightly sloping and well drained. It was a two-year clover and timothy sod that had been manured to increase the timothy crop and incidentally the sod to be plowed down. Most of the plot was manured after plowing and the manure well disked into the soil. It had I think, a double application or about 1,000 pounds per acre of the regular corn fertilizer used on the rest of the field. It was well prepared and well cultivated, but only when and as the rest of the field was.

The result of the contest was a surprise both to the contestants and to the community at large. We knew we had been growing big crops of corn but did not realize just how big they were. Outsiders in considering the yield should take into consideration the fact that ours is not a naturally rich soil, and the yields show the result of persistent efforts to improve the soil and the seed and intelligent and thoro cultural methods. I do not believe that there was one plot in the eight that had not had a heavy seeding of crimson clover as a catch crop after each crop of corn during the past twenty or twenty-five years; and this with red clover in the rotation, the feeding of considerable live stock and the careful saving and applying of the manure have gradually built up our soil to a good state of productiveness.

It is not so surprising when some one man reports a crop of 100 or 125 bushels of corn per acre, but when a list of contestants average 127 bushels per acre it certainly should be a source of pride and satisfaction to all parties concerned. It is needless to say that the contest will be conducted this year with more contestants and more intensive methods. The plans are well under way at the present time and if the season proves favorable we should have a still better report to offer next winter.

Last October a committee was appointed and preliminary plans were made for a corn exhibit to be held in connection with the Farmers' Institute at Fawn Grove on February 4 and 5. It was decided that the association offer $60 in prizes for the best Yellow Dent, White Cap Dent and White Dent corn. As is usually the case, a great many of our farmers declined to put their corn on exhibition and pay the entrance fee when they thought some one else might put up better corn, but there were 21 samples entered for the prizes, and almost that many were merely put on exhibition on a separate table where there was no entrance fee to pay. The exhibit was not at all large, but the corn was so large and so good and so well selected that it called from Hon. A. L. Martin, Director of Institutes, the statement that "You might go from Ohio state line to New Jersey and from the Mason and Dixon line to New York and nowhere could you find a display of corn that would approach it in size of ears and quality." As an indication of its quality, I may state that one of our members who won first prize on white corn at the state show in York on January 20-22 did not even land 4th at Fawn Grove.

The display of yellow corn was not quite so large or so good, but a finer display of White Cap Dent would be hard to find at a state show, particularly if size had its due share of consideration. The judging was carefully and conscientiously done by Mr. D. H. Watts of Clearfield county and Mr. E. B. Dorsett, of Tioga county who were speakers at the farmers' institutes. The prizes awarded were as follows:

Yellow Dent.—First, H. M. Anderson, $8.00; second, R. W. Anderson, $6.00; third, Dr. Vallie Hawkins, $4.00; fourth, John M. Brown, $2.00.

White Cap Dent.—First, D. R. Wilson, $8.00; second, M. E. Smith, $6.00; third, C. W. Shaw, $4.00; fourth, Dr. Hawkins, $2.00.

White Dent.—First, John Jamison, $8.00; second, M. E. Smith, $6.00; third, James Richardson, $4.00; fourth, C. W. Shaw, $2.00.

The total attendance at the farmers' institute was 1,850 persons, and if we judge by the comment in the community after the event, both the speakers and their speeches were very highly appreciated. I am sure that our corn growing contest is working for much larger crops of corn and if our corn exhibit will increase the quality of our corn as the "Maryland Farmers Week" show has improved the quality of Maryland corn, anything that we can possibly do and any prizes that we can possibly offer to increase interest in it will be well spent indeed. It was my privilege to carefully examine the Maryland Exhibit three years ago and again the past season, and I want to say that the improvement in quality was a revelation to me. We think that we are a great corn growing nation, but I want to state here that there will be corn crops, and crop averages in advanced communities during the coming 5 or 10 years that will surprise the natives.

A Postal Brings ISBELL'S SEED CATALOG FREE
Northern Grown Seeds
At Moderate Prices—Satisfaction Guaranteed
Get ISBELL'S OFFERS in beautiful new color illustrated catalog before you buy seeds. Tells all about seeds, planting, etc.
120 Pages Packed With Bargains
Isbell's Seeds are NORTHERN GROWN—alive with vitality. Everything for your farm, vegetable or flower garden at bargain prices.
Send 10c for 5 Packets Choicest Seeds
This "Sample Collection" includes packets of fine new Melon and Cucumber. All for 10c, which we return as a Due Bill. Let's get acquainted!
S. M. ISBELL & CO.
801 Pearl St., Jackson, Mich.

Eureka Send for Catalog—FREE
Potato Planter
Profitable for the large or small grower. Plants potatoes at lowest possible cost. One man operates it. Opens the furrow—drops the seed any distance or depth required—puts on fertilizer (if wanted)—covers up—marks the next row. Accurate, automatic and dependable. Sold with or without Fertilizer Attachment.
Here's why you should select the Eureka Potato Planter:—Furrow Opening Plow is directly under the axle—that means uniform depth at all times. The seed drops in sight of driver. Steel and malleable construction makes long life and few repairs. Made in three sizes—for one or two rows.
We also make the Eureka Mulcher and Seeder. Shipped from branch near you.
EUREKA MOWER CO., BOX 755, UTICA, N. Y.

ECONOMY
In first cost, upkeep and operating expense, for all kinds of farm work where horse-power is required is secured with
FLINCHBAUGH FARM TRACTORS
2 to 25 HORSE POWER 9 SIZES
Adapted to all classes of work; gasoline or kerosene fuel. Ten years successful use.
Stationary Gas Engines, 1 1-2 to 50 H. P.
Portable Gas Engines, 1 1-2 to 24 H. P.
Tell us your needs and send for complete catalog.

NEW JERSEY STATE BOARD OF AGRICULTURE

The 41st annual meeting of the New Jersey State Board of Agriculture was not a purely agricultural meeting. It degenerated into a sort of political pot pourri. Because of this disposition to inject politics into the proceedings of these bodies the work done was not nearly so successful as that accomplished by the various county boards and granges. Such political maneuvering is bound to result disastrously not only to the agricultural bodies which are compelled to suffer from it, but to the perpetrators thereof, as well.

Motor Tax.—In an address, Job H. Lippincott, State Commissioner of motor vehicles, recalled the recommendation made by him in his annual report, for a fee of one dollar per horse power on all motor machines. In the report referred to he advocated the abolition of the personal tax on automobilists and an increase in fee to $1 per horse power. He now thinks that this would place an undue burden upon the owner of a cheap and small machine while it would allow the owner of a larger machine and expensive car to pay no more and in some instances less than is now paid in combined registration fee and personal tax. Speaking further on the need for new automobile legislation, he declared that there should be a law compelling the hooding of the high powered searchlights on automobiles, so that their rays would strike upon the road without dazzling the eyes of drivers coming in the opposite direction. Also, he urged the enforcement of the law requiring all horse-drawn vehicles to carry lights. Mr. Lippincott also called attention to his bill now pending in the Legislature providing for the licensing of motor busses and charging a special fee of $1.50 per running mile of route in addition to the regular registration fee.

Rural Schools.—Dr. Calvin N. Kendall, State commissioner of education, stated that rural schools have not kept pace with city schools. The first problem to be met, he said, is that of securing a proper force of teachers for the smaller schools. Too many rural teachers are unskilled. Many regard their work in such schools as only temporary and frequently they remain only a year in one position. In one county, referred to as typical of others, more than half the teachers in the one-room schools were shown to be new in their positions this year. Another defect is that many teachers in country districts are unprepared to adapt their instruction to the real needs of the children. Much of the inefficiency in this respect was attributed to the fact that teachers are greatly underpaid in many sections. If salaries could be increased, waste and inefficiency of many schools would be greatly reduced. Moreover, many well-trained teachers object to teaching in the one-room school often owing to the difficulty of securing desirable boarding places, to the unattractiveness of many school buildings in the country, and to the fact that the schools are not properly equipped with books, maps and other apparatus for teaching.

Dr. Kendall deplored the fact that the movement to consolidate schools has not gone on as rapidly as might be wished. A consolidated school usually means a more efficient school, because it can be made a graded school. In reply to critics who fear the centralization of all school authority in the State board of education, he said that it was not the purpose of the department of public instruction in any sense to force consolidation.

CHAMPION EAR AT WEST CHESTER CORN SHOW.

State Population and Production.—Franklin Dye, secretary of the state board of agriculture, showed that population, chiefly thru immigration, is increasing at an enormous annual rate, largely a non-producing element so far as agriculture is concerned, all of whom demand food. The number of farmers is not increasing in like proportion, while the number of men willing and capable to work on medium-sized farms is almost negligible. The total value of the farm crops in 1913 in this state was $35,172,282; vegetables and fruits, $12,000,000; milk, $18,396,000; poultry and eggs, $5,172,000, or a total of $70,740,000. This is an increase of $1,388,537 over 1912. In the last 14 years, the farm crops in New Jersey have increased in value more than $56,000,000.

Tuberculosis.—J. S. Frelinghuysen, president of the commission on tuberculosis in animals, outlined some of the work that has been accomplished by that body. He said it had prevented the wholesale dumping of diseased cattle from other sates into New Jersey. Last year 16,388 cows were imported from other states, and were examined and certified by inspectors of the commission. The preceding year 16,085 head were imported. In addition to this work the commission, upon application, had inspected 227 herds of cattle in the state. It had condemned and killed 424 animals, for which the owners were paid $17,189.

Election.—The board elected the following officers for the ensuing year: President, Joseph S. Frelinghuysen; vice-president, John T. Cox; secretary, Franklin Dye; treasurer, J. Harvey Darnell; executive committee, George E. DeCamp, Theodore Brown and A. J. Rider. The president, vice president and secretary were all re-elected.—D. T. H.

TESTING SEED CORN

A Warning!

In making some tests for germination of seed corn recently, I found the condition much more serious than I had anticipated. Ears that had all the appearance of containing strong germinable grains, failed in the test box; while the total percent of germination was much lower than the average for some years past. The seed ears in this test were harvested before freezing weather in the fall, and stored in a frost-proof room, with good ventilation. The conditions under which it was stored since harvested is certainly ideal, and I cannot believe that the poor results in the test box can be credited to any faulty methods in storage. I lay them to the extraordinary weather conditions, beginning with the killing frost on September 14th, when the corn was yet in a more or less immature state. The leaves were completely killed, while the stalk was yet full of sap. With the leaves dead and dry after the frost, the sap was prevented from evaporating from the stalk and ear for a long time even after cut and shocked.

The weather remained warm and moist for nearly a month after the frost, resulting in many ears germinating and sending out a mass of sprouts under the husk. A large number of such ears could be found at husking time. No doubt the germs were damaged more or less in nearly all the ears, even tho no signs of sprouts were apparent. As these same weather conditions existed over a wide area of territory, the amount of good seed corn may be very scarce this spring.

If this same condition is widespread, it demands urgent attention. There is but one way to make sure that your seed will grow; and that is to test each ear separately by taking a number of kernels and planting them in a test box. Appearance of an ear is a very uncertain guide. This work must be done in such a manner that a record of each ear will be known. The testing of a number of kernels from a bulk lot of shelled corn will not do, for it is necessary to locate and reject the dead ears. In order to grow a maximum yield of corn on an acre, there must not be any missing hills. Seeds of strong vitality is one of the essentials to a good corn crop. With seed corn that is unusually low in vitality this year, it will pay well to test the seed. This work can be done during stormy days, before spring work begins.—H. E. Moats, Mercer Co., Pa.

PROGRESS IN THE PERRY COUNTY HILLS

Seldom does one find as interesting a rural community as that which lies about the village of Landisburg, back in the hills of Perry County. Here, rocked in the lap of generous natural resources, are a people sturdy in make-up and generous in spirit. Very marked progress is realized there at present in the operation of one of the most successful High Schools of the state. The school, now only three years old, has some forty students in the high school work in addition to the children in the primary grades. The remarkably large class in the high school work is due to the friendly co-operation of the village and country in the determined effort to have there a central educational institution second to none in rural communities.

Rev. Materniss, who is one of the local pastors, preaching at three appointments per week, is also supervising principal of the school and teaches constantly and we know very efficiently—a dual professional man. At a recent farmers' institute held there, with the entire school in attendance, he gave a peep into his vision of the school of the future in the title "When We Are a Full Grown School." His portrayal was that of an optimist who's unselfish aim and effort must result in great good for the locality, every individual of which seems to be in harmony with the spirit of co-operation for better educational and cultural environment. There really seems to be none of those shrunken-up mortals standing around asking, "What is it going to cost." Here is a place where they are getting the "worth" of their money."—D. H. Watts, Clearfield Co., Pa.

YOU NEED THIS $7.50 Stewart Ball Bearing Machine
It's a valuable outfit that should be in every stable. Those who know the horse best have agreed that to clip him at the proper time improves him in every way. He looks and feels better, does more work, rests better and gets more good from his feed. Insist on having the "Stewart." It's the easiest to turn, does the fastest work, stays sharp longer and is more durable than any other clipping machine ever made. Get one from your dealer, or send $2.00 and we will ship C. O. D. for the balance. Your money and transportation charges back if not pleased. Catalogue Free.

INCREASE YOUR WOOL MONEY
The way to do it is to get more longer and better wool that will bring a higher price from the buyer. You can if you use a
Stewart No. 9 Ball Bearing Shearing Machine
It turns so easy that a boy can run it all day without tiring. It is ball bearing throughout, including a ball bearing shearing head, shears quick and evenly all over. The price including four sets of knives is only $11.50
Get your dealer to send now, or if you prefer send $2 and we will ship C.O.D. for balance and you may try the machine and if not satisfied money will be refunded. Write for catalogue.
CHICAGO FLEXIBLE SHAFT CO., 215 Ontario St. Chicago, Ill.

Potato Profits
depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why
IRON AGE 100 Per Cent Planters
often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. With or without fertilizer distributor. Ask your dealer to show you this Planter and write us for booklet, "100 Per Cent Potato Planting" and copy of Iron Age Farm and Garden News.

Mention Pennsylvania Farmer in writing our advertisers

The Business of Farming.

By ARTHUR D. CROMWELL, Chester Co., Pa.

Farm management is a new science. Farm bureaus are new institutions which, with the money appropriated under the Leever bill, are to become powerful agencies for carrying the message of the scientists to the farmers. Heretofore the scientists and the agricultural press have emphasized the increasing of production, but farmers are to become intensely interested when the message to them concerns itself with increasing the net profits or what, in farm management, is called the Labor Income from the farm. As manager of a Farm Bureau I was repeatedly called to visit farms. The owner would say, "Here are my records and books, here is the farm, now tell me why I am not making more." Sometimes I could detect errors in management and sometimes I could suggest means of increasing the production of the farm. But the farmer would say, "There is Thompson or Jones. His farm is not producing more than mine, and yet he is making money and I am not." You see I lacked a standard. I needed some measure by which I could tell what that farmer ought to be making.

Fortunately, the men in the Bureau of Farm Management at Washington have just organized some statistics which, when published, will be one of the nicest and most far-reaching pieces of constructive agricultural economic work that this or any other government ever offered its farmers. As a basis of this study, 600 farms were visited and yearly reports gathered. Many other farms in other states were visited by other men in order to gather statistics to compare with the reports of the 600 farms. The farms are in a dairy section of Pennsylvania. Prices for feeds are higher than in the Middle West and prices for milk are but little higher. So that it is fair to say that most any farmer in the dairy sections of New York, New Jersey, Pennsylvania, Delaware, Maryland, or any other state near a large city can reproduce the same results on equal areas.

The studies will be published in bulletin form when we get to the other end of the red tape. For accuracy in this study, we take 370 farms which are farmed by their owners. This is done in the belief that owners are better farmers, as a rule, than renters. Let us examine the results of the 20 poorest-paying farms and then the results of the 20 best-paying farms and try to learn what makes the difference. Do not say that you have not time to go over these figures. Head work pays as well as hard muscular labor, and there are some important lessons here.

AVERAGE OF 20 POOREST FARMS

From 80 to 120 Acres. Average 99 Acres

Working Capital (cash)	105	Labor income	—24
Total	$10,030		

The average crop area was 56 acres; number of cows milking, 9.4 for 12 months in the year; percent of income from crops, 34; crop area per horse, 16.3 acres; number of horses, 3.7; receipt per cow, $48; working capital other than land and buildings, $1,835; crop index compared with 100 percent, 84 percent.

Now compare these unsuccessful farmers who actually gave $24 for the fun of farming, with twenty farmers who are making an income of over $2,000 per year and getting house rent, milk, eggs garden truck, fruit and much of their fuel in the bargain.

AVERAGE OF 20 BEST FARMS

From 80 to 120 Acres. Average area 101 acres.

Receipts		Expenses	
Potatoes	$400	Labor	$602
Wheat	245	Feed	408
Hay	335	Seeds	58
Other crops	89	Fertilizers	164
Cattle	360	Livestock	308
Hogs	105	Machinery and Repairs	311
Poultry	92	Taxes and Insurance	101
Eggs	159	Miscellaneous	155
Milk	2,238	Inventory loss	18
Miscellaneous	130		
Inventory gain	702		
Total	$4,855	Total	$2,125

Capital		Summary	
Land and Buildings	$9,480	Receipts	$4,855
Machinery and Tools	974	Expenses	2,125
Livestock	2,941	Farm Income	2,730
Supplies	399	Int on capital at 5 percent	697
Working Capital (cash)	153	Labor Income	2,033
Total	$13,947		

The average crop area was 63 acres; number of cows milking, 20; number of horses, 5; receipts per cow, $106.50; crop acres per horse, 12.6; crop index, 117; working capital, $4,468.

What lessons have we here? Certainly the size of the farm does not make the difference. The poor ones averaged 99 acres and the profitable ones but 101 acres. But it is very noticeable that the profitable farms are producing more, not in one line alone but in each and every line. Second, the profitable farmers are putting on more labor—$602 compared with $385. Third the paying farms are better equipped. It takes more capital to make a large labor income than the poorer farmers are using—$9,480 for the profitable farms against $8,194 for the poor farms. Fourth, the profitable farmers are not trusting "all in one bottom." That is, they are carrying well, a number of lines, altho the dairy does bring in about half of the gross income. A fifth inference is that the poorer farmers need better cows—they have an income of only $48 per cow against $106.50 on the better farms. From my personal knowledge of the farms, I have reason to believe that natural differences in the farms cannot account for the difference in labor incomes. The secret of success on the better farms is efficient equipment and general good executive ability in farm management.

DAIRYING PER ACRE AND PER COW

On the farm of J. H. Reichart, of Berks County, a dairy is conducted on an intensive system. Each acre is expected to produce sufficient roughage to sustain one animal, including the work horses and mules. Three silos are used, aggregating a tonage capacity of about 400 tons. Last year the average milk yield of the herd, including 20 heifers, was 6,740 pounds of 5 percent milk. This herd is composed of Jerseys and grade Jerseys, and a peep into the place will convince one that the owner is a close student of methods and management in every detail. His breeding between families and in line breeding demonstrates more than ordinary skill. Figuratively speaking, Mr. Reichart constantly has his eye on his herd and individual merit and tendencies and his finger on the pulse of profit and loss. He has intimate knowledge of each animal of the herd and knows a defect or blue ribbon point every time. The Cooper sales are attended annually where Jersey quality is studied, and today four bulls are on the place and three of these are of breeding age.

We find Mr. Reichart a past master on the market problem. Many of his patrons by extended courtesy have traced the milky way from the city of Reading back to the hills where they were seated to a banquet in the midst of clean and beautiful cows, the source of their milk supply. Formerly the milk was sold direct to consumers from the wagon at 8 cents per quart. Later the output is wholesaled at the same price and the fat content fixed at 5 percent, while the bottle caps still display the name or trade mark of the producer just as when he was the distributor.

Ninety percent of the farms in this locality are farmed by tenants, and in most instances there seems to be a damaging difference in the viewpoint of tenant and owner as to methods and management — the very factors that often contribute to success on the Reichart farm, such as the use of the silo or systematic breeding of the herd. To sum up, the Reichart farm has been in the family ownership for many years, since about 1739, and is dear to the heart of the owner, who is determined that its productive capacity shall increase under his stewardship. There is here no dependence in the local "Hex" (doctor) nor do hollow horn or "wolf-in-the-tail" delusions enter into the problems of the place. Neither is there undue stress on some one factor to the elimination of other links in the long chain of essentials. Fads and frills have no place here, just close careful attention to detail, a tracing from cause to effect in breeding, feeding and soil building, and a close study of the market end of the business.—D. H. Watts, Clearfield County, Pa.

Union Grains
UBIKO
Biles Ready Dairy Ration
24 Percent Protein, 7 Percent Fat, 9 Percent Fiber.
The economical feed for milk production. Contains no filler, nothing but high-grade standard feeds. All the Cottonseed Meal, Linseed Meal, Distillers' Dried Grains and first-class mill feeds your cows require. It makes successful dairying certain and easy. BY-PRODUCTS OF THE DAIRY

Dairy farming is one of the occupations in which profits are made only by narrow margins. Where milk is sold on the butter fat basis, the price received is often only five cents per pound more than the cost of the production. This would mean that the average cow from butter fat alone would net her owner only about 25 cents per week. Of course, the skim milk and sometimes butter milk is returned to the farmer.

The butter milk may be sold as a beverage. Much of the "butter milk" sold thus has never touched butter. When milk is separated the skim milk is mixed with one-two hundredth of its volume of whole milk and allowed to sour; then churned for a few minutes and strained. The whole milk gives it a fat content about the same as the true butter milk, and the remainder of the elements are about the same. This adulteration can not be detected.

Much skim milk and butter milk is marketed as cottage cheese. This is made in several ways, but all are alike to the extent that the milk must be soured and curdled by heat. Some people add rennet to the sour milk, but this is not required to make good cheese. The whey is strained off and the curd pressed into the mold used to print butter. On farms where poultry is kept, the skim milk is often soured and scalded by pouring boiling water into it; then strained and fed to young chicks, ducks or turkeys.

There is, in many cases, not enough demand for these various manufactured articles to use all these by-products, and where cheese is made, the whey is left. These by-products should all be retained and fed to pigs and calves. It has been shown that five pounds of skim milk have as much food value as a pound of shelled corn, or two pounds of whey have the same value when fed to pigs or calves. At this rate, skim milk would be worth about 25 cents per hundred pounds when corn is worth 70 cents a bushel, and whey is worth twice as much.

In some instances the skim milk has been fed to the cows that produced it. Experiments are being tried to find if colts can not be successfully raised on the mixed ground grain with skim milk. If such experiments prove successful, the dam will be able to work without the drain on her vitality caused by raising a colt. All skim milks should be pasteurized before being used as food for man or beast, and it should be used soon after separation and not allowed to sour.

If milk is sold to the creamery and the skim milk returned, it is always pasteurized by the creamery, for one does not get his own milk back, but only a pro rata share of all of it. The creamery dares not expose your stock or yourself to the diseases which your neighbor may have. When possible, all of the milk should be sold in forms edible by man, but where no market is near, it can be used as feed for live stock and thus increase the profits of the farm.—Howard Roudabush, Center Co., Pa.

BALANCED RATION FOR CALVES

A reader writes: "I am feeding my calves a little oil meal and blood meal with skim milk. Is this advisable? How long should I continue to feed skim milk?"

Oil meal and blood meal are both rich in protein; so also is skim-milk. Consequently when you feed these two feeds with skim milk you are not balancing the ration so far as protein and the carbohydrates are concerned. You have all the protein in the skim milk that the calves need and, in fact, more than they need. I should say that you would have a better balanced ration if you cut out the oil meal and the blood meal and simply fed the wheat middlings and skim milk.

I would feed a calf milk just as long as I had the milk to spare. Don't be afraid that it will hurt the calf, even if you feed him until he is a year or a year and a half old. There is no cheaper feed than skim milk. The trouble is to have enough of it so that you can spare it for calves after they get old enough so that they can get along without it very well. Some people feed skim milk to their cows and get good results from it. You can feed skim milk to any animal that you can educate to drink it, and get splendid results.—C. C. L.

GETTING ACQUAINTED FOR FUTURE WORK.

CORNELL DAIRY STUDENTS

The annual meeting of the Cornell Dairy Students' Association was held at the College of Agriculture, Ithaca, N. Y., Wednesday, February 11th, 1914. The meeting was one of the most successful ever held in the history of the Association, and a larger number of the former students were present than ever before. Over 50 new names were added to the membership of the association. An interesting program was given.

The following officers were elected for the ensuing year: President, Loran Isbell, Oswego, N. Y.; secretary, Roy C. Clark, Norwood, N. Y.; Treasurer, C. R. Owens, Freedom, N. Y.; College Secretary, H. L. Ayers, Ithaca, N. Y.

PREVENTION OF NAVEL ILL OF COLTS

Navel ill is also known as joint ill, omphalo phlebitis, septic arthritis of sucklings, and pyosepticemia of the newly born. The many requests for information regarding this ailment of newly born colts indicate that it exists in many localities. The unfavorable outlook after the appearance of the disease, together with the fact that the disease when present requires the attention of a veterinarian, demands that the breeder should concern himself with its prevention.

This disease is caused by a micro-organism, and several bacteria have been suspected of being responsible for this malady. Every one of the suspected organisms is found abundantly in manure and objects contaminated with manure. The infective material gains entrance into the colt thru the open umbilical cord as a result of its coming in contact with litter, floors, or discharges from its dam contaminated by one of the organisms which cause the trouble. There are cases on record where the infection has taken place before birth, and while some investigators claim this method to be the principal mode of infection, still the prophylactic measures adopted to guard against the infection thru the navel cord have given good results in a large number of cases. Since infection before birth can not be controlled satisfactorily, we are justified for all practical purposes in preventing navel ill by guarding against the infection thru the cord at birth or soon afterwards.

Cleanliness of stables where pregnant mares are kept must be insisted upon. This is especially necessary where outbreaks of navel ill have been known to exist. Mares in the last stages of gestation should be placed in a box-stall which has previously been cleaned and disinfected. The bedding should be frequently renewed, and the external genitals and neighboring tissues should be kept clean and disinfected with a 2 percent solution of carbolic acid or 1 percent liquor cresolis compositus, or any other reliable disinfecting agent. Operations for opening abscesses and removal of afterbirths from cows should not be executed in the immediate vicinity of mares in an advanced stage of pregnancy.

The foal when dropped should be placed on clean bedding. In any event the cord of the foal should be washed in a disinfectant solution and tied at about one and one-half inches from the navel with a band or string which has previously been soaked in a disinfectant solution. The navel cord is then severed at about one-half inch below the band with a sharp pair of scissors and again disinfected. The ligature should, however, not be tightened until pulsation of the vessels in the cord has ceased. The stump of the cord is then painted with strong carbolic acid solution, tincture of iodine, or a mixture of equal parts of tincture of iodine and glycerin. The stump should be washed daily with a disinfectant and either painted with iodine mixture or carbolic acid, or dusted with some reliable antiseptic healing powder. The parchment-like dried stump may be cut off after five days and the naval wound washed with a disinfectant solution and dusted with powder until healed.

The cases of navel ill resulting from infection before birth can not well be guarded against. By keeping those mares which are advanced in pregnancy in good physical condition the fetus will be expelled immediately upon the opening of the uterine cavity. Once the infection of the navel cord has set in, the cord should not be ligated, but should be washed in a disinfectant solution and a veterinarian called for the subsequent treatment.—Dept. Circular.

THE COSTLY CUR

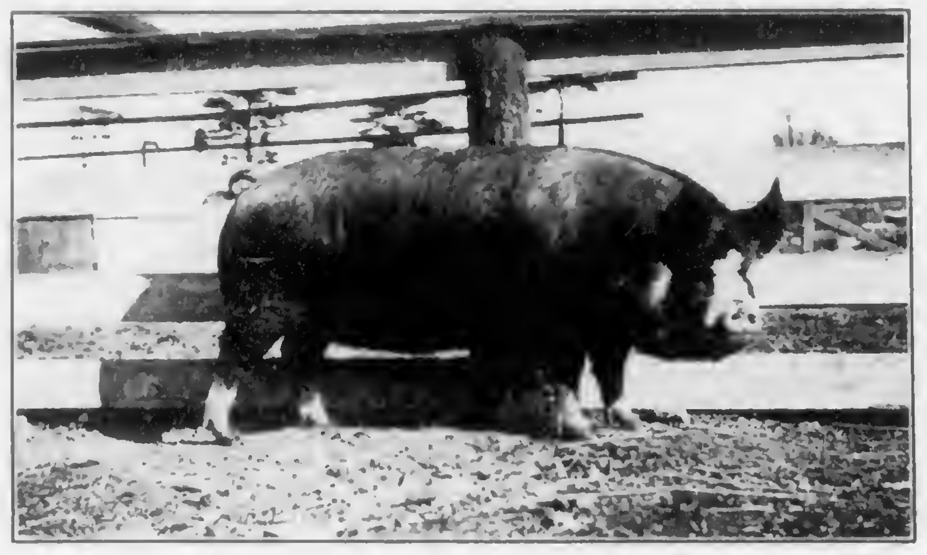
It is natural for people to be fond of pets. The affection of the dog for his master makes him the favorite pet of many. This is especially true of people who live in cities where the useful domestic animals can not be kept and so the city dogs multiply until they are an intolerable nuisance. They overrun the gardens, bury bones in the flower beds, dig up the lawns, tip over the garbage cans and cause frequent neighborhood quarrels on account of their frequent annoying depredations.

We hear frequent complaint of the high cost of living coming from laboring men and yet many of these men are boarding a useless dog the year round, at greater cost than that of one member of the family. Six hens could be kept at about the cost of keeping one dog, and they would at the same time return an income above their cost and make cleaner and fully as acceptable pets on which to lavish natural affection.

The sheep killed on the farms every year cost immense sums. Several years ago, I had a flock of fifty-six choice breeding ewes raided by two bird dogs and twenty-eight of them were killed in one night. We had the satisfaction of killing the dogs but that did not compensate for the loss of the flock.

I often hear farmers speak about "a good farm dog." The best farm dog I know of is the dead dog. The farm dog that does not cause more steps than he saves is so scarce that he is a curiosity. To be of any value to handle stock a dog must be trained and that demands more time and patience and skill than most farmers can devote to the work.

The damage to the sheep industry is not the most costly count against the dog. I know several families, mostly renters, who can ill afford it, who are never without from one to three dogs.—E. P., Beaver Co., Pa.



BERKS PRINCESS 179014, RECENTLY PURCHASED FROM THE BLUE RIDGE FARMS BY THE ELLENWOOD FARM, MONTGOMERY CO., PA.

NOTABLE SALE OF BERKSHIRES

An important addition was recently made to the Ellenwood Farm herd of Berkshires in the purchase of 20 head from the Blue Ridge Berkshire Farms. These 20 Berks had carried away the honors at several of the large southern fairs. Among the bunch were Collossal Premier, 139,691; Berks Princess, 179,014 (shown in illustration on this page); Blue Ridge Daisy 2nd, 179,020, and Blue Ridge Stumpy, 160,069. This blood traces back to such notable individuals as Lord Premier, 50,001; Longfellow, 16,835, and Masterpiece 77,000. The purchase represents the cream of the Blue Ridge Berkshire herd, and every Pennsylvania breeder will be glad to know that it has come to this State.

Agricultural Display at Panama Fair.—The farmers of New Jersey will have a display at the Panama-Pacific Exposition next year, but just how large a fund will be available for this purpose is not known as yet. Heretofore, the agricultural interests of the State at similar expositions have been slighted in favor of the manufacturing industries.

International Special Dairy Feed

THIS IS THE FEED THAT—

MAKES YOUR FEED BILL SMALLER
YOUR MILK CHECK LARGER

INTERNATIONAL SPECIAL MOLASSES DAIRY FEED

INTERNATIONAL SPECIAL DAIRY FEED is composed of ground grains, grain products, cotton seed meal and molasses. Is far superior to ordinary mill feeds for feeding with ensilage or with home grown grains and is also extensively used as an entire grain ration and used in this manner will produce more milk at less cost than can be obtained from any other method of feeding.

We have many reports showing an increase of 1½ quarts per day on each cow after commencing the use of International Special Dairy Feed as an entire grain ration or when mixed in equal parts by weight with other grain feeds. Just figure out what an increase of 1½ quarts per day on each cow means to YOU. It means twelve gallons more per month from each cow. It means 240 gallons more per month from a herd of twenty cows. It will surely pay you to give this feed a trial.

Ask your dealer for International Special Dairy Feed. If he don't keep it for sale, then send us your dealer's name and address—we will arrange with him to supply you. (C-I)

The Culture of Bush Fruits.

By Prof. W. B. NISSLEY, Pennsylvania State College.

The growing of bush or small fruits such as strawberries, raspberries, blackberries, currants, and gooseberries has been neglected to some extent by Pennsylvania growers. The opportunities in this state are much greater than one at first realizes. Here we are in Pennsylvania with between six and seven million people within its boundaries, next door to New York with about nine million population, together making about one-sixth of the population of the United States. In fact we have the best markets in the world at our doors. One might say that our perishable bush fruits cannot be shipped to other than local markets, yet if Oregon is selling strawberries on the Chicago markets and Florida is shipping strawberries to Pennsylvania and New York, we can surely reach almost any part of Pennsylvania with the perishable small fruits under modern means of transportation.

The soils in Pennsylvania in general could not be improved upon for the production of our small fruits which accounts for them growing wild over our hill sides. If one will study the markets of our large cities and especially those of our smaller ones, one will find that the supply is very limited in proportion to the demand. I am glad to say however, that the growing of small fruits has increased in extent and has greatly improved in methods during the past few years, probably due in part to better shipping facilities, improved varieties, and a better knowledge of growing and handling the crop. The labor is light, the investment need not be large, the returns are quick, and no other crops are more certain. The most important things to be remembered in producing small fruits are to locate in a section reasonably safe from killing frosts, where moderate-priced labor of the proper kind may be available at certain seasons of the year, convenient to a local market or shipping point.

Probably one reason why the small fruit industry is not very popular, is on account of the care that should be given the plantation during all seasons of the year. Many growers are apt to neglect pruning or culture at some time or other, which will soon spell failure.

I will confine myself to raspberries, blackberries, currants, and gooseberries and omit strawberries at this time as that is a very important subject in itself and cannot be justly treated with the rest.

Raspberries (both red and black) and blackberries, can be treated under the bramble fruits. In planting bramble fruits the first thing to be considered is the location or site, and the soil. It might be said in a few words that land that will produce good farm crops will produce bush fruits. The soil does not need to be very rich as many people suppose; in fact, too rich a soil is not best as the growth will go to stalk at the expense of fruiting. A well-drained soil is very important yet not a dry soil. The soil should have enough humus in it to hold moisture a long time. One will find that the wild berries do best where they are grown in partly shaded conditions, and that dry soils and the direct burning rays of the sun are injurious, tending to produce small, dry, withered berries. Gentle slopes are very good provided the soils are not too dry or sun's rays too direct. The air is usually very good on such slopes. In the bottoms the soils are usually richer but frosts are more likely to settle. Red raspberries will ordinarily prefer the lighter soils that are not too rich, while the black varieties and blackberries prefer deeper, richer soils as they are heavier feeders.

Stable manure is undoubtely the best fertilizer as humus must be incorporated in the soil to hold moisture, or a mulch of some kind must be maintained. If manure is used no nitrogen fertilizer need be applied. One should also be careful that too much nitrogen is not applied in the manure especially with red raspberries. Black raspberries and blackberries will stand more nitrogen. Very little commercial fertilizer need be applied. Potash seems to be the important element next to nitrogen. A good proportion is as follows: potash 100 lbs. per acre in either the muriate or sulphate form or as wood ashes; cover crops or manure for nitrogen, or if these are not used, 100 lbs. of ni

LAND THAT WILL PRODUCE GOOD FARM CROPS WILL PRODUCE BUSH FRUITS.

WELL-SET BRANCH OF GOOSEBERRIES.

VALUABLE INFORMATION FOR UP TO DATE FARMERS

The benefits obtained by planting Sword Bean as a legume for Nitrogen inoculation and as a cover crop for adding humus to the soil cannot be surpassed. In addition it means a 50 percent cut in your commercial fertilizer expense. One bushel as a trial will be sent to any address East of the Mississippi River charges prepaid upon receipt of $7.50 and points West for $9.00. Make remittance by Postal Money Order or registered letter.

trate of soda or 125 lbs. of dried blood can be substituted; and for phosphoric acid 250 lbs. of floats or 150 lbs. of acid phosphate. These amounts can be varied according to soil conditions, but it can readily be seen that the application should not be too heavy.

Red raspberries are self propagating by means of shoots or suckers. These may be reset when young and at any time that it is convenient, provided they are not transferred far. If they are shipped they should be taken out during the fall or early spring. Never pull the young plants but dig them so that they will not break off. They may be planted in rows or hills. When planted the former way they are usually set 3 feet apart in the row with the rows 5 feet apart, and when the latter method is used they are ordinarily set 4x4 feet or 5x5 feet. Great care must be taken to keep the excess suckers destroyed either with a hoe or by cultivation. If this is neglected the stalks will become too numerous and spindly and will not fruit.

Blackberries are propagated by tip layering. The tip of a cane is buried which soon takes root and forms a new plant. By burying the whole cane a number of stalks can be propagated from the same cane. The small stalks may be planted in either fall or spring but are preferably healed in, protected over winter and planted early in the spring.

The pruning problem is an important one. With black raspberries, and blackberries the young shoots that come up in the spring should be tipped when about 30 inches high for black raspberries and 4 or 5 feet for blackberries, so that laterals will grow the same season. The next spring these laterals should be cut off from 8 to 12, or 14 inches from the stalk; this will make a stiff support for the fruit, which will be born on the laterals. Then after fruiting, cut out the old canes close to the ground and burn them so as to prevent the spread of disease.

One must remember that in bush fruits the stalk is grown one year; it fruits the next year and then it is useless. With red raspberries it is a question whether the young cane should be topped or not. Most growers do not summer prune this type as it has a tendency to produce more suckers when tipped, and the laterals do not mature sufficiently in the fall to winter over properly. With red raspberries, the important prunings are to keep down the excess suckers and cut out the old canes after fruiting.

Constant tillage from early spring until fall must not be overlooked; this is very important for several reasons: (1) For conserving moisture, especially about the time the berries are enlarging and ripening; (2) For releasing plant food, or making the fertilizing elements in the soil more easily available to the plant; (3) For destroying suckers in the case of red varieties.

A raspberry or blackberry plantation will be profitable as long as you take proper care of it; ordinarily they are renewed at from 4 to 8 years, due to disease and insects becoming troublesome. Yet they may be profitable for 12 to 15 years.

Currants and gooseberries are very similar in all respects; hence can be treated together. They will grow on poor soil, but will respond quickly to good treatment and to be profitable should be on a fairly rich soil, rather heavier than for raspberries. They are heavy feeders, hence will require a heavier application of fertilizer of the same nature as raspberries. They can be propagated most conveniently by taking hard wood cuttings 6 to 8 inches long of well seasoned, one-year old wood in the fall. These are buried several inches deep with the large end up in order to callus or heal over properly; they may then be planted or stored away in damp sawdust or sand, and under a low temperature until spring, when they should be planted early. Prune so as to leave from 6 to 8, or sometimes more stems to a stalk and practice a gradual renewal of the plant. In this way the plantation should be good for 8 to 12 years. They are very hardy and will endure the most severe winters.

All persons growing small fruits are especially interested in the returns. A good yield from a well cared for acre of red raspberries should be 140 bushels or 4,480 quarts, which at 12 cents a quart would amount to $537.60; of blackberries, 150 bushels, 4,800 quarts at 12 cents, $576; of currants, 350 bushels, 11,200 quarts at 12 cents, $1,344; of gooseberries, 400 bushels, 12,800 quarts at 12 cents, $1,536. If 12 cents a quart is too high for some localities, estimate at 10 cents or even 8 cents and the returns will still be quite large. Last year large canneries paid $100 a ton for currants and gooseberries which is about 10 cents a quart, wholesale.

The harvesting problem is the difficult one and in the case of gooseberries a cranberry picker would be a great labor saving device. Varieties to be planted will depend upon your particular condition with particular reference to climate, soil and market. The most profitable varieties, under general conditions are as follows:

Red Raspberries: Cuthbert, Columbian, London, Turner, Marlboro. Black raspberries: Cumberland, Gregg, Kansas, Eureka, Conrath, Mammoth Cluster, Older. Blackberries: Snyder, Taylor, Agawam, Eldorado, Rathbun, Erie, Early Harvest. Currants: Red Cross, Perfection, Victoria, Fay's Prolific, Pomona, Varsailles, Cherry. Gooseberries: Downing, Houghton, Columbus, Chautauqua, Industry.

STRAWBERRIES

Small fruits are an ideal intercrop for the growing orchard and are very profitable as well.

Soil requirements are similar to that of apple trees and with the constant cultivation which is necessary for success, no extra work of this kind need be done in the orchard. The minimum distance of intercrop from the young trees is 4 feet.

The soil should be rich in nitrogen and the mineral elements, and should contain plenty of humus. The humus in the soil is one of the greatest aids in maintaining abundance of moisture. Stable manure with the addition of a small amount of some phosphate fertilizer is the best. It should be applied at the rate of 5,000 to 10,000 pounds per acre. With the exception of a pure sandy or heavy clay soil, small fruits will thrive on any soil.

Harvesting the small fruit crops is usually a difficult proposition. In sections where there is plenty of cheap labor, especially foreign women, this problem is minimized.

Strawberries.—An acre of strawberries will bring 3000 quarts if taken care of, and considerably higher yields have been known. Because of susceptibility to frosts, strawberries are not a sure crop in Pennsylvania, but if well mulched in the fall as they always should be, the blossoms can be held back as much as three weeks. Use pedigreed plants. A little observation will show that there is a great deal of difference in the bearing qualities of individual plants and this apparently plays a large part in determining the bearing qualities of strawberry plants.

For commercial purposes spring is the only time to plant. If fall planting is done some plants will be killed off. Put the plants out as soon as the ground can be worked and is warmed up. Prepare the field as if for a garden. Nothing is gained by setting the plants in cold soggy ground, as growth will be retarded more effectually in this way than if the plants are set later.

The matted row is best and the best distance is 12 to 15 inches apart in rows 4 feet apart. Set the plants so that the crown is just even with the surface. If the crown is covered the plant will surely die and if too shallow the plant will dry out and will not grow well.

Get into the field with the cultivator and hoe as soon as they are set and keep a dust mulch without interuption the entire season. Under average conditions, one man can take good care of an acre of strawberries but it will keep him busy.

At the end of the season, there should be about one foot space between the unbroken matted rows. Allow each plant to set from 5 to 8 plants, cutting off the rest with the hoe. A pinch of nitrate to each plant will often produce a rapid healthy growth, and is advisable if the foliage is light colored. A spoonful of wood ashes around each plant may be used to advantage also. The idea is to make the plants grow as rapidly as possible until the rows are perfect. In no other way can a maximum crop be obtained. The second season there will be a full crop.

The worst pests of the strawberry are cut worms and leaf spot. Never plant in a sod ground. Clean cultivation for a period of one to two years will generally free the soil of the cut worms. Bordeaux or lime sulphur early in the season will prevent leaf spot.—H. G. Fassett, Wyoming Co., Pa.

Use the *Available* Kind of Fertilizer

For many crops all the *available* plant food that is needed is one grain to each pound of soil.

When such a small quantity of food must do all the work for your crop, it is exceedingly important that what you put into the soil in the form of fertilizer shall be *available*—that it shall have not only the right quantity, but the right quality and right crop value.

It has cost us forty years of experience to know how to mix the right kinds and the right quantities of ingredients for fertilizer.

Bowker's Fertilizers

accomplish also the more difficult task of getting the right blending, the right solubility into a mixture which will run readily and freely from the farmer's planter, and which will remain dry and drillable as well as efficient until used in the field. We make a brand to fit every crop need.

Write and tell us what your crops are, and we will send you our illustrated catalogue.

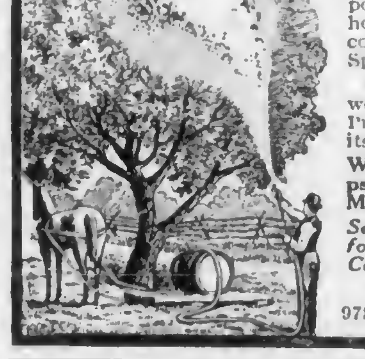
DEMING Farmers' Friend Sprayers
DEMING PUMPS THE WORLD'S BEST
are just the thing for keeping field, vineyard and orchard clean. Powerful enough to do lots of good work quickly and light enough to be moved around easily. Pump is well constructed, with every important part of easy access. The 50-gallon barrel rests on a hardwood platform, which is supported by strong iron wheels.
Deming Nozzles Stand for Highest Pressure
The nozzle is the "business end" of every spraying outfit. Demming Nozzles lead because they do the work right. Nine different kinds—all carefully tested—fit any make of spray pump. Use "Deco" Hose for lasting service.
Spraying Guide FREE
Tells when and how to spray garden,— field—, and orchard crops. Catalog shows all styles and kinds of sprayers for every need and purpose. Gladly sent free on request, together with name of nearest Deming Dealer. Ask for both To-Day.
The Deming Co.
415 Depot St., Salem, O.



More than 100,000 Farmers and Fruit Growers Use the STANDARD SPRAY PUMP
With it they spray their tallest orchard trees *from the ground* in half the time required by others. The knapsack attachment enables them to spray their potatoes and low growing crops at the rate of an acre an hour or better. They whitewash their barns and chicken coops and spray "dip" on their live stock with the Standard Spray Pump.
Made throughout of brass, with nothing to wear out or break, the Standard Spray Pump lasts a lifetime and pays for itself over and over again.
Warranted 5 Years. Price $4 Prepaid. (West of Denver $5.) Money back if not satisfied.

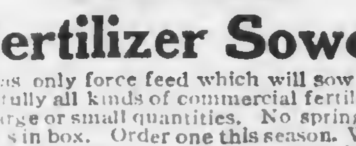
These Seven Cows
Kept one year on one acre of Eureka Corn. This seed corn yielded over 70 tons on one acre in one year. Think of it. Keeping seven head of cattle for a whole year from the product of one acre goes a long way toward reducing the cost of milk. This enormous crop won our $50.00 gold prize for the heaviest yield. No other corn has ever equalled it.
Eureka Corn
Grows tallest—has most leaves—more ears. Eureka is a white, smooth dent corn and is short jointed. If planted thin, it will yield two and three ears to the stalk.
Planting Eureka Corn is as good as an insurance policy to any farmer. It grows where others fail. Four or six acres of Eureka Corn will fill a 200-ton silo. Write us at once for our 1914 catalog. Quotations and list of our wonderful varieties of big-yielding corn and other seeds.
ROSS BROS. CO. 41 Front Street Worcester, Mass.
"Everybody Knows Ross's Seed Grows."



Sows Fertilizers QUICKLY EVENLY
Sows broadcast or in rows all kinds of commercial fertilizers—nitrate, phosphate, guano, lime, ashes, etc. Distributes it fast and evenly in amounts from one hundred to several thousand pounds per acre. Simple and strong. Gauge is easily and quickly set.
The Chicopee Line

Combination, Peg and Spring-Tooth, and Disk Harrows
Cultivators
GENERAL LINE
Oil and Gas Engines
Oil Tractors
Manure Spreaders
Cream Separators
Farm Wagons
Motor Trucks
Threshers
Grain Drills
Feed Grinders
Knife Grinders
Binder Twine

STEEL frame on steel wheels—that is the lasting basis on which International manure spreaders are built. All parts, including box, beater, spreading mechanism, apron, are built by experts, using best materials, from careful designs based on field tests.
Every detail is strong and durable, built for long life and ease of draft. Among the features that will interest you are these: Simple protected beater driving mechanism, all of steel; load carried on rear axle, insuring traction; reversible gear and worm; low, easily loaded box, with ample clearance underneath; end gate, preventing clogging of beater while driving to the field; etc.
All styles are in the I H C spreader line, high and low, endless and reverse apron, and various sizes for small and large farms. Our catalogues will tell you more. Write for them and let us tell you also where you may see I H C manure spreaders.

MODERN IRRIGATION FOR FARMS
COST OF IRRIGATION NO LONGER PROHIBITIVE
The Campbell System and modern methods place irrigation within the means of every farmer. If you grow crops whose failure means vital loss to you would you spend $20 per acre per year to irrigate and insure them? Fertilizer costs that much. If you grow vegetables depending on re-setting young plants can you afford to lose them by draught when irrigation will prevent? Practice has shown irrigation to produce three times as much per acre as adjoining unirrigated land. Irrigation is not an experiment—progressive plant growers do not expect to succeed without it.
A rotating nozzle operating on 25 lbs. pressure, covering soil evenly with fine drops; equals one-half inch rain in 2 hours. First cost and operation less than other systems. One nozzle covers circle 47 feet in diameter. Does not clog with fine sediment. No posts. All piping underground except uprights. Only one man needed for operation. (*Special nozzles for greenhouses.*) For information and demonstration address
E. C. WORREL CO., Moorestown, New Jersey.

Write For ALLEN'S 1914 BERRY BOOK
Every fruit grower, gardener and farmer who reads this paper should get a copy of this free book. Describes Allen's true-to-name varieties and gives valuable information on
How to Grow Big Luscious Strawberries.
Hundreds of standard varieties of carefully grown Strawberries, Blackberries, Raspberries and other small fruits for every soil and climate. For 29 years Allen's plants have been leaders. All plants shipped from carefully selected fresh stock and packed to arrive in good condition. Write today for THE 1914 BERRY BOOK.
W. F. ALLEN 143 Market Street Salisbury, Md.

How to Grow Fruit FREE
Write today for our book—more than a catalogue. Tells what to plant in your locality. How to plant, how to trim, spraying, as well as giving you the choicest varieties of apples, peaches, cherries and other fruit—all "Wood Quality" stock. Cost you about half agents' prices. We sell direct only. We will send this book absolutely free. Not the biggest book, but one you can depend on! Don't fail to write for a copy. Return mail brings it.
WOODLAWN NURSERIES, Allen L. Wood, 589 Culver Road, Rochester, N.Y.

SEED BOOK FREE
RATEKIN'S BIG BOOK ON CORN GROWING is now ready for you. It tells how to grow big crops and all about best varieties of corn for your locality, also all about the best Seed Oats, Wheat, Barley, Speltz, Grass, Clover, Alfalfa, Pasture and Lawn Mixtures. Potatoes and all other Farm and Garden Seeds. This Book is FREE to all who are interested in the crops they grow. A Postal Card will bring it to your door. Write for it today.
Address RATEKIN'S SEED HOUSE, Shenandoah, Iowa, Box 56

A Municipal Market

The City of Philadelphia is preparing to make a practical test of the municipal market plan. The proposed system will provide a means for the farmers of surrounding producing sections to place their products directly before the city consumers with the intervention of but a single middleman or handler, and he being in the employ of the farmers. The plan, in brief, is to provide a market place to which the farmers can ship their goods, to be sold direct or by wholesale, as the growers may direct and the supply develops. The manager of the market is to be selected by the farmers and will work on a salary basis or sell goods on commission. The city will provide the market facilities at low rental, assist in gaining transportation facilities and maintain supervision over the management to prevent irregularities developing. The city is first interested in securing a supply of fresh, wholesome products for its people, and the plans contemplated provide for securing such products by opening a way for direct marketing from the farms. The success of the undertaking will depend largely upon the extent to which the farmers make use of the opportunity offered. This is a matter which might profitably be taken up by granges and other farmers' organizations. A representative of the city government may be secured by such bodies to present the plans and discuss organization of the work. The proposal ought to be of interest to every community seeking a better outlet for its farm products.

The Seed of Co-operation

The article on the first page of this issue carries valuable suggestions for every rural community. Too frequently co-operative movements are regarded as complex undertakings requiring elaborate organization. Progress in developing co-operative effort has been retarded by this misunderstanding of its requirements and purposes. There is much talk of widespread co-operation of farmers, but there can be nothing of the kind until there are more co-operative organizations like the one described in Bradford County. Farmers must learn to work and think and act together in the smaller things of every-day business of their own community before they will be prepared for or even attracted to more general co-operative work. The smaller, every-day needs must first be met, and in solving them the farmers will be preparing for united action in other things. What is described as having been done in Bradford County ought to be possible in hundreds of other counties of the state. The cow-testing association is so eminently practical and valuable in its accomplishments that it ought to appeal to every dairy community. The co-operative creamery, in spite of many failures in many sections, has advantages that mean profits where backed by the right sort of management and unity in its patrons. Co-operative buying of commodities staple in the community is the next logical step, and from this may be developed the community storage house, the community laundry and many other features which would meet the mutual needs and advance the mutual interests of the community. More power to the Bradford organization, and may it have many followers and imitators thruout the state.

Pure Linseed Oil

A bill now before the U. S. Senate provides for the prevention of manufacture or sale of adulterated or misbranded linseed oil. The importance of such a measure to farmers is readily apparent thru the use of linseed oil in the manufacture of paints and the use of oils in home-mixing of paints. An investigation made recently by one of the western states disclosed the fact that large quantities of linseed oil were being sold that were adulterated with petroleum and other cheap oils. Practically every state having pure oil laws has found such adulteration, and it appears that this practice is quite general, which may account for the deterioration in lasting quality of some paints. The states that are enforcing pure paint or pure oil laws have no supervision over such products in interstate trade. The new senate bill is designed to prevent the shipment of adulterated oil and will thus complete the control of the practice in all states. The bill specifically provides for the prevention of manufacture, sale or transportation of misbranded or adulterated linseed oil, for regulating traffic in such oil, establishing oil standards and providing for proper labeling. It is based upon the most effective features of several state laws and carries the endorsement of state officials who have been active in securing legal restrictions on the oil and paint trade. The measure, known as Senate Bill 4295, is now in the hands of the senate Committee on Manufactures, of which Senator George T. Oliver is a member. Farmers should urge their interest in this measure upon their congressional representatives. Farmers of this state should communicate with Senator Oliver as to their personal interest in the bill.

Winter Spray

Prof. Stevens, the Lehigh Valley Railroad Agriculturist, issues a timely warning against neglect of winter spraying. He reports evidence of spread and increased quantities of San Jose scale the past year. Stating that this spread may be due to the hot, dry season of 1913, he urges thoro spraying with lime sulphur this spring. Orchardists can not afford to be indifferent to this condition. The scale is known to have decreased in recent years because of the increasing practice of spraying, and possibly because of climatic and other influences. But this decrease should only encourage more careful spraying and closer vigilance. It is easier and cheaper to keep the scale in check by a continuance of proved methods than to subdue it again if it is permitted to regain the foothold it had a few years ago. This is not work for the large orchardists alone. The spraying should be done in all orchards. A few neglected trees in the community are a menace to all of the trees of that community.

Home Conveniences

Pennsylvania farmers are receiving considerable adverse advertising thru a story now going the rounds to the effect that a farm woman of the state recently broke down under the strain of excessive and useless farm work. The assertion is that this woman had been under the necessity of carrying coal from the barn to the kitchen for many years and finally broke down from overwork. When the husband was asked if there was any reason why a coal bunker could not have been provided near the cookstove and filled directly from the wagon, he replied that there was none, but that he had never thought about it. It is with no effort to excuse this farmer that attention is called to very similar examples of indifference to ordinary home comforts and conveniences to be found in thousands of homes in every state. How often one finds the family of a well-to-do farmer carrying spring water up a steep bank and from varying distances just because the family water supply has always been carried in such a way, because it is good water, and because the head of the family has never thought about the waste of energy and the inconvenience of it! An hydraulic ram might be installed for a few dollars and save all these steps for all the years to come, or a more extensive water system might be installed at a larger cost and provide a water supply to meet every demand of the home. The same condition of indifference to waste of time and energy is found in construction and grouping of buildings, placing and hanging doors and gates and arrangements for doing the things that must be cared for every day of the year in every home. The little remedy that might correct these errors at very slight cost is most frequently lacking because the people inconvenienced have "never thought about it."

STATE CAPITAL NEWS

Abandoned Farms.—The question as to whether Pennsylvania is making the most of its agricultural possibilities and whether farms are actually being abandoned is to be put to the test. The opportunities for cattle raising in Pennsylvania on such lands have frequently been referred to and a bulletin of the department of agriculture has pointed out these possibilities. People living in some of the northern counties, especially those where lumbering operations have been carried on and in some of the mountainous regions, have been asked to furnish the name and location of any farms which have been given up. The reasons for abandonment will be ascertained. It is believed that the neglect of soil study is to blame for much of the decline in products. Instances are known where fertilization has been given scant attention and farmers realizing that to build up land would involve so much expense have accepted small prices for properties and gone to towns to live. Definite information on the subject is to be asked.

Farm Counsellors.—The spring work of the farm counsellors will be started soon after the close of the farmers institute season early in March and providing the roads are in good condition it will be under way in April. Schedules are being arranged for economy of time and expense. Many requests seek advice on fertilizing and water drainage, these subjects being regarded as of prime importance.

New Land Damage Question.—A brand new land damage question, which may have a widespread effect, has arisen before the Public Service Commission in the shape of a complaint from a resident of New Ringgold who complains that the Philadelphia and Reading railway company's locomotives have damaged his land with cinders and asks that some steps be taken to compel the company to exercise greater care. For years complaints have been made about fires being started on farm lands and on woodlots thru sparks, and efforts to secure some legislative provision to check it have been taken time and again. The cinder proposition is one which everyone owning land along a railroad line can understand. The railroads have been making efforts to stop careless firing of engines which causes the waste and the farmers have been trying to prevent showering of fields with the dirt.

First Crop Report.—The material for the printing of the first crop report of the State made under the action of the legislature of 1913 in creating a bureau of farm statistics in the department of agriculture is about ready for the printers. It is the first instance of a systematic effort to gather first hand information about the farms of the state and what they yield. A list of farms was procured from assessors in each county and information about the crops was asked of responsible people in rural districts and small towns. An average of three in five persons addressed responded and the bureau was able to get a pretty comprehensive collection of data. The report will be issued during the latter part of the year.

Driving Out Bad Brands.—In an effort to show the need for a more drastic law covering state control of fertilizers the officials of the department of agriculture have made a number of arrests for the sale of fertilizers claimed not to have been correctly branded or of brands which were not up to the standards represented. In a dozen instances convictions were had but in others a chemical battle is on. If the state inspectors had authority to go to factories and go right into the examination of ingredients before they were burned or treated it would save the farmers of the state considerable money.

The Telephone Tie-up.—It begins to look as tho it will be many months before the State will be able to dispose of the proposition for a schedule of telephone rates thruout Pennsylvania. The proposition has developed so many angles that long study must be given. The independent companies with whose interests the "farmer lines" are more or less identified has adopted the same course as the Bell and demanded a hearing on the effect the arbitrary fixing of rates will have on business. Some of the rural lines can barely make ends meet on rates adjusted by local conditions.

Institute Work.—Attendance at the farmers' institutes this year, in spite of the condition of roads due to snow and the weather conditions has reached a point which may cause it to break a record. A careful effort is being made to secure accurate figures which will be laid before the next legislature in support of an increased appropriation. It is believed that if $10,000 to $15,000 could be made available for extension of this work and $10,000 more for movable schools be given, the benefits would be enormous. For years the institutes have been held on an appropriation utterly inadequate for needs and the success of the farm counsellors system has demonstrated that serious attention must be given to this line of work.

Hunters' License.—Just what the hunters' license law means is illustrated by the last computation of the income from that source made at the State treasury. In all 290,000 licenses have been reported with probably 20,000 more not yet reported. The amount paid in was $261,000. Ten percent of the gross income was retained by county treasurers so that the amount given is net. People here think that about $300,000 will be realized for the state. Unfortunately the legislature neglected to make the necessary appropriation of this income to the game commission funds or for reimbursement of counties which pay bounties on foxes, weasels and other vermin, so that it must lie in the Treasury until the legislature of 1915 can reappropriate it. The same is true of the $700,000 turned in for automobile licenses from July 1 to date. Thus, carelessness in legislating deprives the people of the state of the use of almost $1,000,000, a large part of which could be used on the roads.

Investigate Barn Fires.—Deputies from the department of the State Fire Marshal are investigating a number of barn fires reported in the central section of the state due, it is believed, to tramps or firebugs. The record of fires in country districts is being very carefully kept and it is believed that the 1913 list will show that there are two or three groups of fires that occur in the rural districts. Green hay is a prolific cause, but there are also suspicions of firebugs.

No Agreement On Revenue.—As yet the fiscal officers and highway department officials have been unable to get to an agreement on the subject of use of income from automobile licenses and it looks as tho a court test would be necessary. This will mean a long delay and the consequent neglect of many important roads.—Hamilton, Harrisburg, February 23.

NEW JERSEY FARM NEWS

May Revive Sussex Fair.—It seems now to be a pretty well assured fact that the county fair of Sussex County, which was allowed to die a natural death a few years ago, may be revived. The property upon which the fairs were formerly conducted is to be purchased. It will be drained, graded, the old race track to be resurfaced, grand stands, barns and stalls for exhibition purposes erected, and foundations prepared upon which the various kinds of tents may be erected and the entire property fenced. The fair association will be incorporated.

Farmers May Establish Market.—The farmers of the five counties, Passaic, Essex, Union, Morris and Bergen, who market their produce in Newark are up in arms over what they consider bad treatment at the hands of the Aldermanic committee having charge of the erection of the new city market buildings. The farmers feed a population of over 700,000 people in Newark and its suburbs, and they claim that they are entitled to the very best consideration. Since ground was broken for the market, the farmers have been crowded out on the sidewalks, and they are now informed that no accommodations will be provided for them in the new buildings. Such being the case, they intend to furnish a market of their own. A committee has been appointed, consisting of one prominent farmer from each of the counties in question, with full authority to take whatever action is deemed best. An investigation will at once be made of the market in Providence, R. I., which is owned and operated exclusively by farmers. This market is one of the most successful in the country.

Trout Hatching.—Superintendent Hayford of the State fish hatchery at Hackettstown, announces that the 1,500,000 brook trout eggs from Wiseport, Pa., and the 90,000 rainbow trout eggs from Kalamazoo, Mich., have hatched, proving, he says, the special adaptability of the local waters for hatching purposes. Many streams in the state will be stocked with fish of the species named.

Fish and Game Bills.—Fourteen measures are already before the Legislature to change the fish and game laws of the state. Some are meritorious, while some are just the opposite. A joint resolution, which should be killed, asks Congress to repeal the law recently adopted which provides that migratory game and birds shall be deemed under the protection of the government. Another such resolution creates a commission, without pay, to revise the game and fish laws. Such a commission might greatly simplify the mass of game laws on the statute books, but ought not to afford less protection to fish and game. Two bills which deserve defeat are the ones repealing the gunners' license act of 1909, and the one making it unnecessary for a resident to have a license to hunt in his own county. Those that would strengthen the statutes are: Senate Bill 4295 making a license necessary for fresh water fishing as well as hunting, one license covering both; it is aimed against Sunday fishermen from other States; Senate 125, prohibits dogs running at large except during the open season; House 312, prohibits woodcock shooting in summer; House 313, repeals the act of last year which prevented farmers from killing skunks, foxes and other fur-bearing animals, and House 314, provides for a jury trial in fish and game cases where the penalty exceeds $10.

The Delaware Bridge Question.—The Pennsylvania Legislature has appropriated a sum of money for the purpose of carrying out the idea of free bridges over the Delaware. It is now hoped that the Legislature of New Jersey will make a similar appropriation in order that the idea may be carried out. The bridges that cross the Delaware are just as much a public highway as are the roads that traverse the States between which the river is a dividing line, and the people are entitled to the free use of them.

Seek Federal Road Aid.—A resolution has been introduced into the Legislature for the appointment of a special committee to visit Washington and take whatever action may be necessary to get for the State its share of the $25,000,000 to be expended this year by the National government on good road construction. The resolution recites that the share of New Jersey would not be less than $500,000. It calls for a committee of twelve members of the Assembly, including the Speaker, one member to be chosen from each Congressional district.

Tax Boards to Name Assessors.—Attorney General Westcott is preparing a bill at the behest of Governor Fielder for the simplification and improvement of the taxing conditions in the State, in accordance with the suggestions made by the Governor in his inaugural address. This measure provides for the appointment of assessors in the various taxing districts in each county by the county board of taxation. The assessors will have all the protection afforded by the civil service law. Heretofore, the assessors have been chosen by popular vote, and the result of this has been, that by remitting the dog and poll taxes of the otherwise non-tax paying element of the population, and by gross discrimination and partiality in levying the assessments on real and personal property, unscrupulous men have maintained themselves in the office for years, while those who paid the expenses of running the government were made to suffer.

Bill of Interest to Farmers.—Among proposed bills of general interest to farmers is that vesting in local boards of health power to regulate and license persons engaged in the sale or distribution of milk and cream, giving such boards power to grant or withhold licenses, prescribing a penalty of $50 for the violation of the provisions of the act and giving the officers and agents of the State board of health access to barns, stables, and any place where milk or cream is stored or had in possession for sale or distribution and further providing a penalty of $100 to be incurred by anyone who interferes with an employe of the State board of health in the performance of his duties. Another is that prohibiting the importation of cows over six months old for breeding purposes, unless such animals shall have passed a tuberculin test within six weeks before entering. In order to render clear the technicalities attached to a similar measure adopted last year, a bill has been introduced fixing standard dry measures for fruits and vegetables at baskets of 32, 20, 8, 4 and 2 quarts, and of small fruits at one quart and one pint.—D. T. Hendrickson.

MARYLAND NOTES

Farmers' Club Meets.—The Forest Hill Farmers' Club, of Harford County recently met at the farm of W. L. Tucker. The club passed resolutions endorsing a bill recently introduced in the legislature authorizing the selling of the Almshouse farm, located near Belair, also the $1,000,000 appropriation for Maryland Agricultural College. A bill which would require shipping tags in the nature of checks, to be attached to the milk cans, the railroads to be responsible for all cans not returned was condemned, because it was considered it would probably increase the cost of shipping milk at least two cents a gallon.

National Prize Winner.—A. B. Twining, of Harford County, at the recent National Corn Exposition at Dallas, Texas, won the sweepstakes prize of the eastern zone. Harford County Corn growers have put Maryland on the Corn Map of the world. Corn from Maryland at last Paris Exposition won the highest corn honors.

Protest Proposed School Bill.—Caroline County parents, 1,400 strong, have signed petitions asking their representatives in the legislature to oppose any bill that proposes to abolish rural schools and consolidate them with town schools.

Complaint Against Roads.—Petitions to the Finance Committee of the Senate and the Ways and Means Committee of the House of Delegates are being circulated thruout the state complaining of the condition of the roads which "are so smooth and slippery that they cannot be used by teams to haul produce to market without grave danger to man and beast." They want thoro investigation of roads laid down by the State Roads Commission before any further appropriation for roads is considered. They complain the roads are costing from $10,000 to $12,000 per mile, are veneered with Tarvia, oil and other chemicals so they can only be used by automobiles; while good stone roads are being constructed by the Highways Commissions costing between $4,000 and $6,000 a mile which both farmers' teams and automobiles can use satisfactorily.—G. O. B.

COUNTY NOTES

Wayne Co., Pa., (N.E.) February 4.—Has been very cold but warmer now. All kinds of livestock wintering well. Ice crop harvested. Prices good. Pork, dressed, 11½ cents; butter, 37 cents; hay, $16 per ton. New milk cows very high. Men cutting summer's wood now. Has been a very good winter for farmers so far.—E. W. Carl.

Ocean Co., N. J., (C.) February 4.—Weather fair and pleasant. Prices on cows are a little lower. Crops about same. Eggs, 33c doz.; butter, 33c; poultry, 15c. Fruit buds too forward for time of year. Strawberries showing up too plain. Frost about all out. Roads in fair condition for hauling. Some missed getting their ice.—C. M. Rorer.

Morris Co., N. J., (N.) February 4.—Warm, foggy. Winter wheat and rye looking good. Livestock in good condition. Cows and horses are high. Hens are beginning to lay some. Farmers are doing some repairing to buildings and cutting summer supply of fire wood.—Geo. F. Williamson.

Potter Co., Pa., (N.C.) January 31.—We have had a warm spell the last week. All livestock is looking good. Beef cattle are about all picked up. Pigs, 10c lb. live; chickens, 12c live; beef, 10@11c, dressed; butter, 35c lb; eggs, 35c doz; potatoes, 60c bu; apples $1 to $1.25 bu. Farmers are doing odd jobs, hauling produce to market hauling logs and wood.—Louis Zundel.

Steuben Co., N. Y., (S.W.) January 26.—Very cold, with plenty of snow for good sleighing. Live stock wintering well. All kinds of stock high. Springers from $50 to $90 each. Beef cattle high and scarce. Hogs dressed, 11c lb; potatoes, 60c bu, at car; butter, 35c lb; eggs, 36c. Farmers busy hauling logs, cutting wood and hauling hay and potatoes. Many holding potatoes for higher prices.—G. W. Rowley.

Crawford Co., Pa., (N.W.) February 13.—Twenty degrees below zero; has been moderate. Live stock wintering fairly well. Milk, $1.80 per cwt. for 4 percent; pork, 10c; cows high; eggs, 30c; butter, 28@30c. A few farms changing hands. Farmers' Institutes well attended; lectures good. Farmers putting up ice.—J. F. Seavy.

Lancaster Co., Pa., (S.E.) February 10.—Cold this week. There has been very little snow this winter. Coldest was 6 degrees below. Live stock is in good condition. Prices continue to be high. Wheat is looking fine. The mild open winter has allowed farmers to do much outside work. Some plowing has been done. Manure is being hauled out daily. Wheat, 92c; corn, 70c; oats, 44c; hay, $16; straw, $8; eggs, 35c; milk, $1.65 per hundred. Farmers are stripping tobacco. Some few have finished and delivered their crops. Prices have advanced slightly. It is selling at 8, 10 and 12c depending on quality. Farm sales are the order of the day.—J. Henry Haverstick.

Harford Co., Md., (N.E.) February 7.—Weather clear, and cool; have had a very open winter. Live stock of all kinds in good demand. Mules and horses bringing $200 to $250 each; cows, $75 to $80; calves, 10c lb; hogs 8c; chickens, 15c; eggs, 30c doz; butter, 35c lb. Wheat looking good, and prospects for a good crop. Owing to the open winter farmers, have a great deal of plowing done and are busy pruning fruit trees, hauling manure, etc.—D. G. Harry.

York Co., Pa., (S.E.) February 9.—Warm and greater part cloudy and rainy until February 8 when it got decidedly colder. Live stock prices are practically unchanged. Fowls, 14c; eggs, 24c butter, 33 to 38c lb; potatoes, 75c per bu; apples, $1.50 to $2 bu; tobacco, Havana, 12c lb; wheat, 93c bu; corn, 70c bu; oats, 47c bu. Farmers busy stripping tobacco, hauling manure, and doing odd chores about the farm.—Clarence D. Emig.

Montgomery Co., N. Y. (E.C.) February 10.—Mild; many blustering days but no severe storms. Stock of leading farmers looking well. Many lean cattle in some vicinities. Hay, $16; dressed pork, 12½c; butter lower, about 30c; eggs, 33c. Many farmers joined Dairyman's League. The League buys a $40,000 plant at Fort Plain. No farm work being done. Farmers' Institutes are largely attended. Granges active. Many large auctions this month.—John L. England.

Crawford Co., Pa., (N.W.) February 17.—Ground hog saw his shadow so we are having plenty of winter. Thermometer went 10 to 20 below zero last week. A great many good horses are raised in this section. Good fresh cows, $75 to $100; hogs about 8c; milk, $1.75; hay, dull, selling from $8 to $10; eggs, 28c; butter, 25c. Farmers Institutes thru this section this winter are exceptionally good. Very able speakers.—C. M. Potter.

Cumberland Co., N. J. (C.) Feb. 18.—Cold weather has put a stop to farming operations. About half of the sod ground was plowed during warm weather of last two weeks and farmers have taken advantage of the unusual weather and started other spring work. Harrowing sod before plowing is a new idea in this section and several are experimenting with it for the first time this season. About the latter part of this month many carloads of potato fertilizer will be carted by the farmers. Potato planting is generally begun about the 20th of March in this locality. Many public sales around the county. Cattle and hogs selling very high; horses moderate in price.—C. J. S.

Lycoming Co., Pa., (N.C.) Feb. 18.—Cold and snowy. Owing to extremely cold weather with no snow on ground wheat and rye looked very bad but we have about 20 inches of snow now. Roads are drifted, worst they have been for several years. Rural mail delayed and all kinds of business tied up. Most farmers shoveling snow and repairing damages caused by snow. A good many public sales advertised. Fresh cows more plentiful but no cheaper.—Clyde E. Hall.

Lebanon Co., Pa., (S.E.) Feb. 11.—Clear and very mild. Live stock is in good condition. Fall seeding seems to be showing up good at present time. Farm sales are held daily and live stock is fetching very good prices. Farmers are engaged in repair work, pruning orchards, and other seasonable work.—Wm. J. Bean.

LEGAL DEPARTMENT

Thru this department Pennsylvania Farmer will discuss general legal queries submitted to it by its readers. Questions involving unusual circumstances and of purely local or special nature can not be handled. This department is open to the free use of readers.

Grading—Obstructing Drainage.—Reader in Crawford County: "Have the road authorities the right to obstruct the outlet to my tile drain by grading the road?"—Yes. You can, however, recover damages for the injury to your property caused by the change of grade. There is an injury to your property for which damages can be recovered when its drainage is materially affected by the change of grade of street.

Sale Of Standing Timber.—Reader in Montgomery county writes: "A bought a farm from B, who had previously sold the timber to C. Can A hold the timber?"—A sale of standing timber under an agreement which expressly provides that the timber shall be cut at once or within a reasonably short time is regarded as a sale of personal property. If by the terms of the contract, however, no definite time is prescribed within which the timber is to be cut, or if the time prescribed is not reasonably short, the contract is regarded as a sale of an interest in land. Assuming that the latter is the state of facts, the sale of the timber to C must have been made by deed or contract in writing, and this deed or contract in writing must have been recorded in the office of the recorder of deeds for the county in which B's land was situated, either (1) within 90 days after the contract was executed, or (2) before the recording of the deed from B to A; otherwise A is entitled to hold the timber, unless before he purchased the land he had actual notice of the sale of the timber. If, on the other hand, the contract between B and C provided for immediate cutting of the timber, it was a contract for the sale of personal property, and probably C has the right to the timber. Apparently the question has not been definitely decided by the Pennsylvania courts. (We are not considering the possibility of fraud in the sale of the land to A. Also we are assuming that B did not reserve the right to the timber in his deed to A. If he did, A has no claim whatever to timber standing at the time he took title.)

Easement—Right To Flood Land.—"Can the owner of a dam which has caused water to overflow the land of a neighbor, claim that land and the wood which has grown on it, the neighbor having paid the taxes thereon for thirty-five years?—Isaac Wildrick, Hope, N. J."

He cannot. When land is flooded as the result of the operation of a dam owned by another, the owner of the land can recover damages from the owner of the dam for the the injury to the land. But if the dam has caused the flooding of the land continuously for twenty-one years (twenty years in New Jersey) the right to damages is lost, and the owner of the dam acquires what is known as a prescriptive right to the easement or right to flood the land. He has, however, no title to the land or to any wood which may be growing on it. The title is still in the original owner, subject, however, to the easement or right of the other to flood the land to the extent to which it was habitually or usually flooded during the twenty-one years (or twenty years in New Jersey).—G. G. & H.

TRADE MARK
Thomas A. Edison
EDISON PULVERIZED LIMESTONE
Nature's Crop Producer
Made from the purest Crystalline White Limestone obtainable.
Pulverized like flour; owing to its fineness of division, immediately available to plant life.
Not being Caustic, can be applied at any time without danger to plant life.
The best and cheapest form of Lime for all crops.
Especially recommended for Alfalfa.
Sustains fertility and increases productiveness of the soil.
Packed in 100 pound Bags, also in Bulk.
For Sample, Booklet, Price, etc., address
Edison Portland Cement Co.
Stewartsville, N. J.

The Accurate Seeder
Bumper grain crops depend primarily upon the seed bed. The old reliable
Pennsylvania Grain Drill
has positive force feeds, low down construction, chain drive, extremely simple throughout. Just the drill for long years of hard service with minimum expense for repairs. Made in all standard sizes, fertilizer and plain, with either hoes or discs. WRITE FOR FREE CATALOG.
A. B. FARQUHAR CO., LTD.
Box 346, York, Pa.

350 Bushels of Fine Potatoes to the Acre
were grown by Mr. E. H. Hatley of Waterville, Vt., by the use of 300 lbs. of Reading Bone Prize Winner. It pays to use high grade animal bone fertilizers.
Write us for our little booklet entitled "An Eye Opener for the Shrewd Buyer." If we do not have an agent in your locality it will pay you to take the agency.
Reading Bone Fertilizer Company, Reading, Penna.

Poultry

REARING OF CHICKS

Of the problems in poultry keeping, the rearing of young chicks is one of the greatest which confronts the poultry world today.

Time after time the poultry keeper has good success in hatching the eggs, but after a good hatch he fails to rear on an average of from 60 to 75 percent and in some cases fails to rear even 50 percent. To be sure we have many poultrymen who have made a careful study of rearing chicks, who are very successful, but on the other hand there are thousands of farmers and poultrymen who raise chicks artificially where the mortality runs as high as from 20 to 60 percent.

A GOOD TYPE OF BREEDER SHOWING STRONG CONSTITUTION.

The question arises then as to the cause of such high mortality in the rearing of the chicks. Do the poultry raisers fail to grasp and understand the fundamental principles for the best results in rearing chicks? There are several factors which may generally be considered for the best results. These are parental influences, surroundings, and artificial circumstances.

Dr. Hadley of the Rhode Island State College says that "Disease is not, strictly speaking, caused by micro-organisms. In most instances, whether in human beings or in chicks, disease is due as much to a weakened vitality as to outside infectious agents or materials." Disease then is merely an offset to the normal condition of the chick's body and this offset is caused either because the vitality is too low or because some outside stimulus is too strong. With the vast amount of work which our experiment stations have done, and are doing upon the subject of rearing chicks, very little is as yet known concerning the true causes for such mortality.

SELECTED EGGS FOR HATCHING. NOTE UNIFORMITY OF SIZE AND SHAPE.

However, there are methods which, if carefully observed, will lessen the death rate in rearing chicks. The first important principle which every poultryman must adhere to is that of selecting his breeding stock. His breeding stock must have a strong constitution and be bred from strong, healthy males and females. Having good foundation stock the way to success will not be so discouraging.

The next important point is the place for the hens to stay in or the home for the hens. A house large enough to give the hens plenty of room, four square feet of floor space per bird, is sufficient. The house should be well ventilated, free from dampness and filth, and should be well lighted, and disinfected with some reliable insecticide.

The feed of the breeding stock should be clean, sweet, and wholesome and easily digested.

The eggs should be gathered often enough so that they will not be chilled, and should be kept in a room where the temperature is about 50 or 60 degrees Fahrenheit.

The incubator should be placed in a room where the temperature varies but little. This room should be kept clean and should be kept free from odors by good ventilation, etc. The incubator should be one of the standard makes. In buying an incubator secure one that is easy to operate, that will admit fresh air and keep an even temperature. It should be cleaned out and disinfected after each hatch. A solution consisting of 4 quarts water to 1 quart creosote is good.

The incubator should be thoroly tested before placing the eggs in it. After it is found to be running satisfactorily the eggs can be put in. The temperature of the incubator should be kept as near as possible to 101½ degrees Fahrenheit for the first week, 102 for the second week and 103 to 104 for the third. The eggs should be turned from 36 to 72 hours after they are placed in the machine and cooled to blood temperature from the third day until the fourteenth day; and from that time they should be allowed to become a trifle cooler until the eighteenth day, at which time turning should be discontinued. The eggs should be cooled in the usual manner, however, until the first egg is pipped excepting to open the trap in the tray so that the chicks may fall into the nursery.

When the chicks are about 36 to 48 hours old they are ready to be placed in the brooder, which should previously have been cleaned and disinfected. Good clean litter such as cut clover or alfalfa should be used under the brooder for them to scratch in.

Any reliable make of brooder which will keep an even temperature, be easy to operate and conveniently adapted to any brooder house will answer all purposes. Top heat is preferable. It must be remembered that the chicks require good pure air, pleasant surroundings, sunshine, clean food, and pure water.

The temperature under the hover should be kept from 95 to 100 degrees for the first week or two and care should be taken that the chicks do not become chilled when removing them from the incubator to the brooder. A basket lined with cotton is very satisfactory for removing them. Chilling the chicks often causes bowel trouble in some form or another and frequently white diarrhea.

The chicks should not be fed until from thirty-six to forty-eight hours old because of the fact that the yolk serves as food for about that length of time. Sour milk has been found by the Poultry Department of the Connecticut Agricultural College to be a preventative for white diarrhea and should be before the chicks at all times for the first six or ten days. Sunlight and pleasant quarters and room to exercise are also important for the little chicks at all times. A little fine grit or oyster shell works wonderfully if fed to the chicks for the first feed because of the fact that it goes into the gizzard and helps mastication and digestion. Feed sparingly of grain and mashes and feed the chicks often. It has been found by experiments that feeding the chicks about six times a day for the first two or three weeks is more satisfactory than two or three times a day.

After the chicks are two to three weeks old the greatest danger of losing them is over but great care should be taken to keep them in a healthy condition at all times. After the first two weeks the feed can gradually be changed and four or five times a day will be astisfactory. All grain should be scattered in the litter so that the young chicks may be kept busy scratching for it.—D. E. Warner, State College, Pa.

LINSEED MEAL AS A POULTRY REGULATOR

Linseed meal is one of the best tonics that can be given poultry. Usually it is added to the mash food in the fall of the year, especially during the molting period, when it greatly assists in the shedding of the old coat of feathers and growing the new crop. Its analysis is similar to that of meat, and of late years many poultry men are using it in the daily mash.

Linseed meal is the residue left after flaxseed has been crushed and subjected to extreme pressure to remove the well-known linseed or painter's oil. The cake that is left is ground fine (to a meal), and, containing some oil and being rich in nitrogenous elements, it forms a rich and healthful food for poultry. The analysis is 30.9 percent protein, and 3 percent fat. Linseed meal, however, being of a fattening nature, should not be fed in excess. Used in too large amounts it is apt to bring on cases of looseness of the bowels, especially in young stock, while properly fed it will regulate the bowels, and thus keep the stock in a healthful condition. The writer feeds it in the proportion of 5 pounds to 100 pounds of ground grain and meat (the meat part being 15 percent.) This is given daily the year round, in the morning mash.

Dr. G. M. Twitchell, before the Massachusetts State Board of Agriculture, said that in his experience he found the best ration for market poultry to be 30 percent oats and wheat, 20 percent corn, and 10 percent linseed meal, all ground together, with 10 percent meat scraps added. This is mixed into a dough with skimmed milk and baked until thoroly cooked. It is then set away for a day or more, when it is pounded fine and fed. The doctor claims that linseed is one of the most valuable parts as it is rich in albuminous food, and hence is valuable in forcing growth.

A gill of linseed meal contains more bone-forming matter than a pint and a half of corn.—Boyd Michael, Atlantic Co., N. J.

VALUABLE FREE CATALOGS

Paints and Painting.—Most farmers know, and all farmers should know Ingersoll paints. They have been on the market for over 50 years and have held the endorsement of leading farmers' organizations for the past 37 years. A new booklet entitled "All About Paint and Painting" tells all about these paints and announces special discount prices good until May 25, 1914. The booklet is mailed free to all who write for it, addressing O. W. Ingersoll, 249 Plymouth St., Brooklyn, N. Y.

Farm Gates.—The old board gate has long maintained its popularity in competition with patented gates, chiefly because of its durabilty, quick repair and general adaptability. The new "Can't Sag Gate" combines these qualities with steel uprights which prevent sagging or dragging. The "Can't Sag Gates" are furnished complete or just the Can't Sag outfit, at prices within reach of all and on a 30-day free trial basis. A catalog giving complete description and details will be sent free upon request addressed to The Rowe Mfg. Co., 725 Adams St., Galesburg, Ill.

Strawberries.—The spring catalog of nursery stock issued by Leamon G. Tingle, 77 Railroad ave., Pittsville, Md., gives special attention to strawberries which are a strong specialty with this nursey. There are a great number of new and promising varieties listed in addition to all of the old standard sorts. The catalog is free. Write to the above address for it.

Bargain Book.—The new Bargain Book, just issued by The Charles William Stores, 1015 Stores Building, 115 E. 23rd st., New York City, contains 1100 pages descriptive of bargains offered in clothing, shoes, furniture, glassware, cutlery, carpets, rugs and, in fact, everything needed on the farm and in the home. Every article is guaranteed or money refunded. The book will be sent free upon request to the above address.

Farm Implements.—Catalog "S" recently issued by Rawlings Implement Company, Baltimore, Md., is a complete buyers' guide for everything in the farm implement line. It lists, describes and gives prices on practically everything that is needed on the farm and about the farm buildings. It is sent free upon request to the above address if you say you are a reader of the Pennsylvania Farmer.

Steel Plows.—A new catalog describing Cambridge Steel Plows lists a full line for every use. Among others are reversible sulky plows, hillside plows, reversible walking plows with hinged coulter and shifting clevis, left hand plows and shovel plows, with steel or wood beams; also disk and shovel hoe plows, and marker and guages. The catalog is beautifully printed and illustrated. It is free upon request to Cambridge Steel Plow Co., 712 Foundry St., Cambridge, Conn.

Makes hens lay. Keeps poultry in "pink of condition." Cheapest food in the long run. *Ask your dealer*—accept no substitutes. Write today for free circular describing foods, seeds and appliances
TAYLOR BROS., 40 Market St., Camden, N. J.

Farmers' Week at Cornell.

The 7th annual Farmers' Week at Cornell was probably the most successful that has so far been held. The general interest manifested by the practical farmers present gave evidence of appreciation of the many lectures given by some of the most prominent men in agricultural life. Everyone present remarked on the ease with which the large crowds were handled and the freedom from congestion. The official registration showed an attendance of 2,500 but many who came for only a day to hear some particular lecture failed to register. There were probably not far from 3,000 who came to get in condensed form the later ideas of prominent men in the agricultural field. A blackboard in a central building gave the time, place and speaker for each lecture and scores of students acted in the capacity of guides, keeping the crowds moving and giving information to strangers.

Beside most of the faculty of Cornell, there were many men from surrounding states upon the program. Pennsylvania was well represented by Dean Watts of State College, who gave a most instructive talk on "the vegetable forcing business." Space will not permit mention of all of the good things offered; the following three met with much favor.

Grass and Clover Sods.—Prof. Alva Agee, of the New Jersey Station talked on "securing heavy grass and clover sods." He pointed out that the best indication of real soil fertility is the presence of thick, heavy sod. The farmer is too apt to think of special fertilizers for corn, for oats, for potatoes, etc. This is one of the serious mistakes we are making in farming today. A general fertilizer is far more important than a specialized one since it tends to permanent fertility rather than a scheme whereby we take from it every possible ounce of plant food. A thin and poor sod is of no particular value in the furthering of a cropping system. A good sod is produced on a limestone soil, rich in phosphorus. These conditions prevail in the bluegrass region of Kentucky, and account for the exceedingly rich, heavy sods which are found in that section. If these conditions are not naturally present, we must put them there, by the abundant use of lime and phosphoric acid. Other things being right, these two factors will produce a rich sod.

Cover crops are good but do not do the lasting good that a heavy sod does, in that they do not carry with them the amount of organic matter which decomposes into humus. The physical properties of the soil must be good to get a good sod. Drainage must be sufficient and cultivation frequent enough to insure a good seed bed. Weeds are the great competitors of plants and hence every care must be given to relieve such a condition in the grass field. If the field is plowed and fitted in August the young plants will be able to get a good start before the weeds can grow. Fit the field as well if not better than for corn, so that all weed seeds in the first three inches of soil will be killed before the grass is sown.

As to the crop in the rotation which should have fertilizer, Prof. Agee says: "The crop which needs fertilizer most is that which gives humus." He bases this sound statement on the fact that it is that crop which tends towards permanent soil fertility. Hence it is the grass crop which must have fertilizer, and for worn heavy soils, he advised 3-10-6 goods, and for more sandy soils a 3-8-8, both to be sown at the rate of from 350 to 500 pounds per acre. Where timothy and clover are sown together, after the clover has run out and the field is straight timothy, it will be better practice to apply the fertilizer early in the spring as growth starts, and to change the analysis to 7-7-7, thus providing more nitrogen for the young plants.

Rural Citizenship.—Mr. Edward Van Alstyne, director of farmers' institutes in New York, gave a most valuable talk on "Rural Citizenship." He declared that agriculture depends not so much upon the character of the land or upon the season as upon the man, and since rural citizenship has as its purpose the upbuilding of man it is vital to the continued prosperity of agriculture. He decries the existing barrier between the city and the country and the passive antagonism which has existed between them. Both are essential to each other. Rural citizenship is essential to the welfare of our nation not only from the standpoint of agriculture but also because the national welfare is so vitally connected with it. The policy of taking abandoned land, remote from the centers of population, simply because it is cheap should be condemned. The farther away a man gets from these civilizing centers the greater tendancy to go backward. Isolation means devitalization, and every man needs civilization.

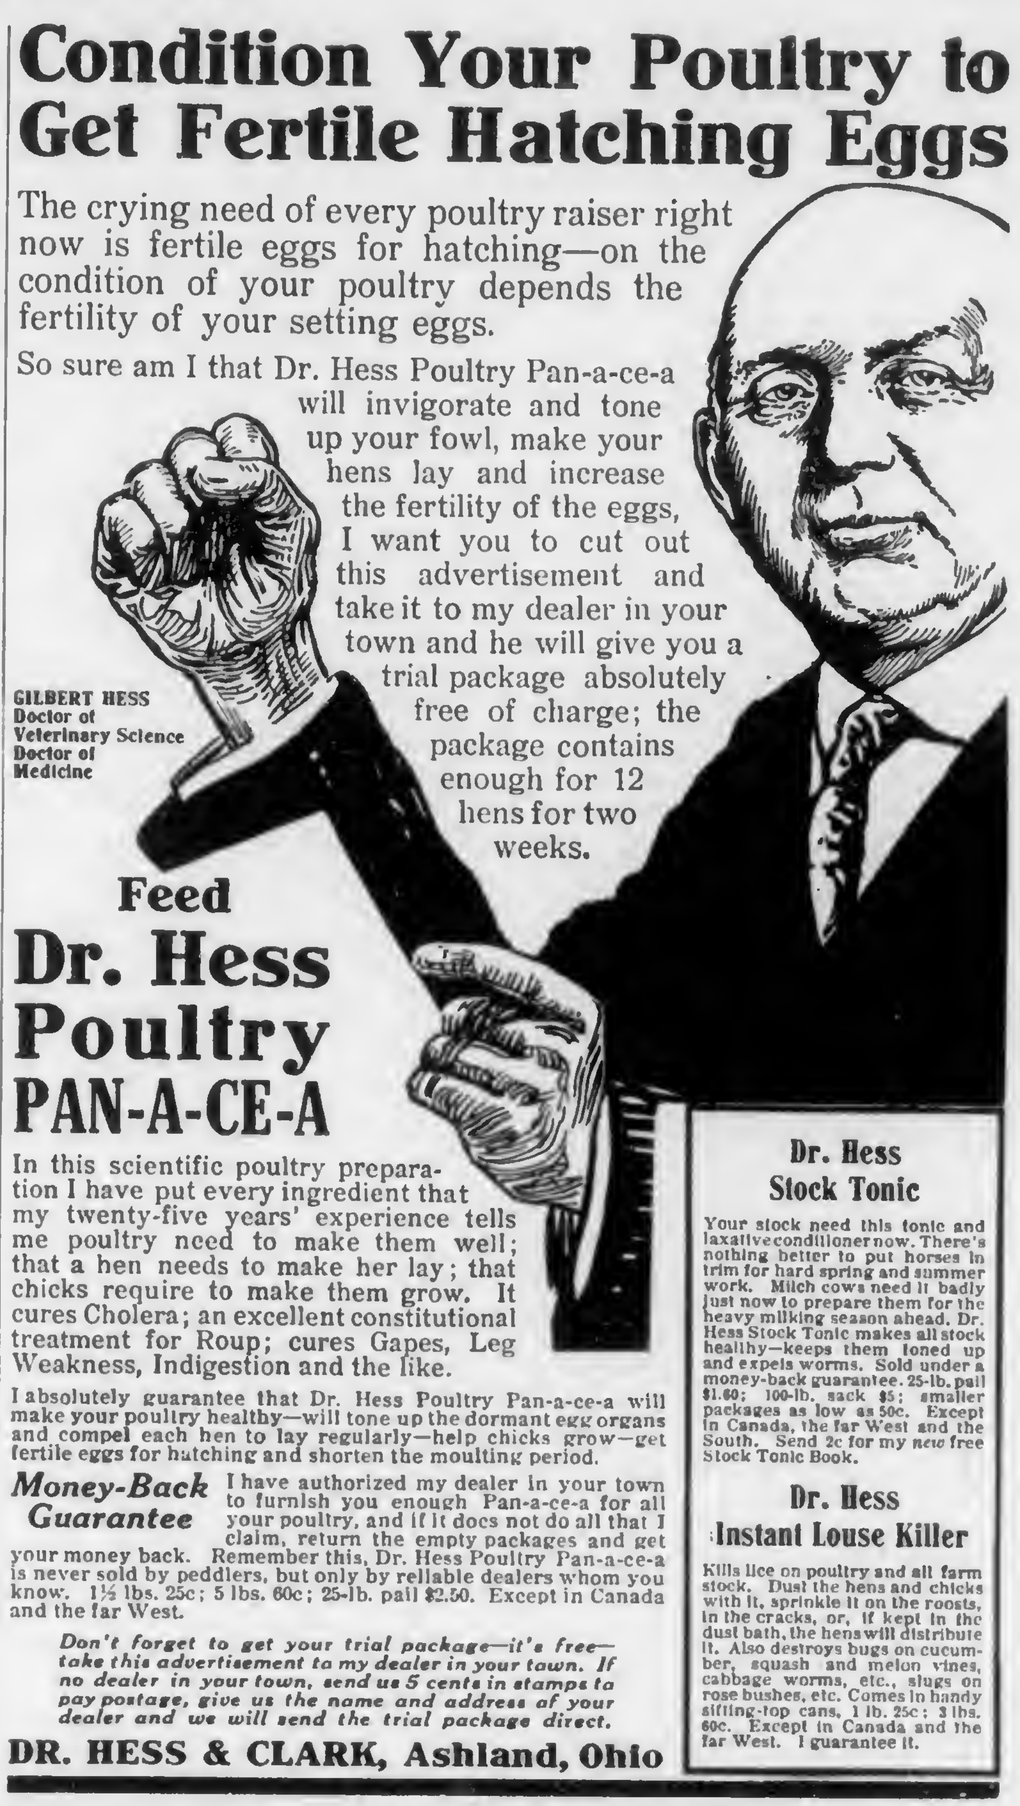
Mr. Van Alstyne pointed out the injury resulting from city men becoming inoculated with the farm bacillus. These men go into the country and by their failures depress farming in that particular section. To fight against this, Columbia University has opened an office, the function of which is to advise men anxious to invest in rural land and to start upon some agricultural venture. In the large majority of cases these men are discouraged, not because there is no room for them but because they have no special training. Men do not own land as they do live stock. It is merely left in their hands in trust. Rural citizenship calls for such use of the land as will make it better when turned over to the next person than it was in the beginning. This means good farming; good farming and rural citizenship go hand in hand. Mr. Van Alstyne strongly advised against buying cheap land in the hopes of building it up while getting a living from it. It is a long hard pull which very few men can weather, and in the end it will pay better to buy better land, even if more debt must be contracted.

Knotty Apples.—All lectures on horticulture were well attended. One of great interest was given by Prof. C. R. Crosby on "insects causing knotty apples." Under this group of insects Prof. Crosby classified the following pests: Codling moth, lesser apple worm, bud moth, fruit tree leaf roller, green fruit worm, red bug, plum curculio, apple seed chalsis and aphids. This is a formidable list of pests, but only two or three are not well known by the fruit growers and these may be controlled with effort and care. The red bug is, perhaps, the least familiar to most growers. It has done wide injury to orchards in a more or less restricted area of New York and adjoining states. When an apple has been stung by the red bug, it does one of three things; it may mummify, may exude gum from the point of attack, or it may continue to grow, in which case the resulting fruit will be badly deformed. The adult insect is a bug of brilliant coloring, being mostly red. It is very active and hence is hard to find unless closest observation is given. A great portion of the deformed fruit in eastern markets during recent years has been the result of the red bug, hence it is important that all growers become familiar with this pest and learn its control measures. To control the red bug, spray with a solution of Black leaf 40 diluted 1 to 800 when the fruit clusters are bursting. If necessary, repeat this application after the blossoms have fallen.

The apple seed chalsis has not received the attention from growers it deserves. The adult of this insect is a four-winged fly which lays eggs in the seed of the fruit. The adults also puncture the fruit, causing an injury much like that of the red bug, rendering the apple unfit for market purposes. Fortunately, only a comparatively few varieties of apples are attacked by this pest, of which the Lady is by far the most important. Since the larvae is inside of the fruit, sprays are of no avail. The only effective control measure is to gather and destroy all the apples that drop from the trees, for these are generally infested and contain the larvae.

The farmers who attended this meeting were keenly interested in what was going on, and there was a seriousness of purpose which spoke well for the future of agriculture. Another point which was the subject of much comment was the number of women who came to attend the lectures on home economics, vegetable gardening and floriculture. The lectures on these subjects were attended by women mostly. The success of this "Week" argues well for the continued advancement of agriculture in this and adjoining states. —A.

"For the land's sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—Adv.



Condition Your Poultry to Get Fertile Hatching Eggs

The crying need of every poultry raiser right now is fertile eggs for hatching—on the condition of your poultry depends the fertility of your setting eggs.

So sure am I that Dr. Hess Poultry Pan-a-ce-a will invigorate and tone up your fowl, make your hens lay and increase the fertility of the eggs, I want you to cut out this advertisement and take it to my dealer in your town and he will give you a trial package absolutely free of charge; the package contains enough for 12 hens for two weeks.

GILBERT HESS
Doctor of Veterinary Science
Doctor of Medicine

Feed
Dr. Hess Poultry
PAN-A-CE-A

In this scientific poultry preparation I have put every ingredient that my twenty-five years' experience tells me poultry need to make them well; that a hen needs to make her lay; that chicks require to make them grow. It cures Cholera; an excellent constitutional treatment for Roup; cures Gapes, Leg Weakness, Indigestion and the like.

I absolutely guarantee that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy—will tone up the dormant egg organs and compel each hen to lay regularly—help chicks grow—get fertile eggs for hatching and shorten the moulting period.

Money-Back Guarantee I have authorized my dealer in your town to furnish you enough Pan-a-ce-a for all your poultry, and if it does not do all that I claim, return the empty packages and get your money back. Remember this, Dr. Hess Poultry Pan-a-ce-a is never sold by peddlers, but only by reliable dealers whom you know. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West.

Don't forget to get your trial package—it's free—take this advertisement to my dealer in your town. If no dealer in your town, send us 5 cents in stamps to pay postage, give us the name and address of your dealer and we will send the trial package direct.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Stock Tonic
Your stock need this tonic and laxative conditioner now. There's nothing better to put horses in trim for hard spring and summer work. Milch cows need it badly just now to prepare them for the heavy milking season ahead. Dr. Hess Stock Tonic makes all stock healthy—keeps them toned up and expels worms. Sold under a money-back guarantee. 25-lb. pail $1.60; 100-lb. sack $5; smaller packages as low as 50c. Except in Canada, the far West and the South. Send 2c for my *new* free Stock Tonic Book.

Dr. Hess Instant Louse Killer
Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

Do you want to save Money and raise all the Chicks? The Ideal Coal Stove Brooder
gives 97 per cent efficiency; in some instances as high as 99 per cent; no other system can equal these results. Coal burning, self regulating, economical and safe. Heats Poultry houses and broods large flocks Small and large farms are using the Ideal with success. Investigate at once by sending for booklet describing the Merits, Economy and Effectiveness of the one best brooder.

RURAL ROAD PROBLEMS

GIVE US DEMONSTRATION ROADS

Also Load and Tire Regulations

The editorial on "Road Demonstration" and the article on "How to get better roads," in the Pennsylvania Farmer of February 14th were most timely. The vote on the road bond issue did not signify that the people of the state did not want better roads, but that they wanted roads whose worth would be proportional to the money expended. Some state roads in this part of the state have not been improved since the state took charge of them. A state road which cost about $10,000 a mile a very few years ago was allowed to become so full of ruts that in places it was almost impassable for automobiles. This piece of road is just outside the largest town in Union County, and perhaps is the most traveled road in the county. Had this one piece of road, half a mile long, been repaired by laying several loads of stone on it last spring, the vote in this county would have been different.

Education in road making is the crying need today. Those who have charge of the township roads do not appreciate the value of the road drag; nor do they realize how good a dirt road can be kept if properly drained and then worked up after heavy rains and at the end of wet seasons. The work which Mr. Martin has done in the Department of Agriculture shows the disposition of the farmers. When they realize that there is something better than they now have they want it. On the road question, the farmer does not realize that anything better than he has been used to is possible. A demonstration mile, so located that it would represent fairly well county or township conditions, would be a great help in enlightening the community. When people know what they can have they will demand it from those who have charge of the road making.

Another need is a law which will regulate the size of a load which can be hauled on a wagon with narrow tires. In Ohio, where pikes have been constructed between all the large towns, the law regulates the size of the load and tire. The farmers in most sections are so anxious to keep the roads in good condition that if one should attempt to haul heavy loads on narrow tires he would soon be in the hands of the law, because he is injuring every man who uses that road. If, in addition to this, the front axles on broad tired wagons were made a little shorter than the hind axles, as is done in some parts of Europe, the road would be subject to continual rolling instead of cutting. The effect of this can hardly be estimated, especially if each driver should try to keep the road rolled smooth by driving on the high points instead of driving in the same rut in which those who went before him had driven.

When community pride is once aroused and each one who drives along the road tries to keep it in the best possible condition; it will not be so hard to keep the roads in a good condition. Carelessness on the part of those using the roads will account for not a little of the poor condition in which they are often found. Consideration for the other fellow is being urged as a leading motive in community life and in the industries. It should also apply on the farm and on the road.—W. G. Owens, Union County, O.

TWELVE-FOOT CONCRETE ROAD AT WHITEHALL, MD.

WASTE IN STATE ROAD BULDING

I have been greatly interested in the series of articles by Dr. McCaskey on the road question. What he says of the King road drag is applicable to the great majority of the roads in our state, yet on certain roads in our township, where there is continual heavy teaming of loads carrying about seven tons of raw slate material for the factories, another foundation is necessary. Six to eight years ago we built a number of roads at a cost of from $400 to $500 a mile. I will give the description of these roads in a later article.

In this article I want to confine myself to the five and one-half miles of road taken over by the State Highway Department. I want to say in the start that if the State Highway Department had given me the money it spent for surveying these five and one-half miles in my township I would have put them in first class condition, and in such condition that they would have cost less for maintenance then some of the $14,000 to $20,000 state highways. If the state highway will give me the amount of money it usually costs, ($14,000 to $20,000 a mile), to build the five and one-half miles of state highway in my township, I can put the 100 miles of road in my township in first class condition.

In the five and one-half miles in my township there is no heavy grade and the money spent for surveying was an entire waste. My experience is that the best surveyors are a pair of good honest pulling horses with a heavy load. They will soon tell where the grade is too steep. I cannot agree with the great cry of the State Department people that the township supervisors are no good, and that they only scrape dirt into the roads. This at least does not apply to the majority of the supervisors in my county and in the neighboring county of Lehigh, as a good many townships own stone crushers and dump wagons, (which I consider essential in good road building in this section) and have permanently improved the roads. This improvement has been due to a great extent to the agitation of the good roads movement.

I am convinced that if the same amount of money spent for surveying, office work and high salaried men, who do nothing, had been appropriated to the townships on a basis somewhat like the school appropriations, that a good many miles of roads would have been improved and undoubtedly some of them permanently. Our present system of building boulevards for the favored few and doing nothing on the most important roads is not right. The facts are that on the five and one-half miles of state highway in my township there is very little heavy traffic, while there is continual heavy traffic on about forty miles. The five and one-half miles could be put in first-class condition with very little expense as it needs very little grading. About three miles has been stoned, about one mile should be stoned and the balance needs very little work and could be coated with heavy gravel.

The position of the State Highway Department in being without funds is clearly its own fault. If it had not helped to defeat the Grabe tax bill, or better still the Benson bill, which proposed to tax all property on the same basis and which seemed to me the fairest bill of all, it would have had enough funds. As a member of the last legislature I am assured that the most important thing towards the improvement of highways is an honest system of taxation, and then there will be ample funds without anyone finding fault.—W. M. Benninger, Northampton Co., Pa.

Mitchell Little Six
$1895.00

Recognizing the fact that the modern farmer is as much of a *business man* as the merchant of the big commercial center, we call the former's attention to the *established truth* that the Mitchell car is an *investment* and in *no sense a speculation*. Not only is the car manufactured to last but its maintenance is economical—a fact that any man of business sense will thoroughly appreciate.

The principle of maximum power on minimum fuel is exemplified to a high degree in the Mitchell Models for 1914 and the strength of axles, frame, springs and other important features is calculated to resist successfully and repeatedly the severe strains and jolts and twists of rough country roads.

Such facts *must* be considered carefully to preserve an automobile as a daily utility and prevent it from becoming a costly luxury. Your Mitchell of today will be looking well and serving you faithfully several years from now and thus annually the cost of your original investment is decreased until it finally disappears.

The Mitchell Models for 1914:

The Mitchell Little Six—fifty horse-power—132-inch wheel base—36x4½ inch tires—two or five passenger capacity - - $1,895

The Mitchell Big Six—sixty horse-power—144-inch wheel base—37x5-inch tires—seven passenger capacity - - - - $2,350

The Mitchell Four—forty horse-power—four cylinders—120 inch wheel base—36x4½ inch tires—two or five passenger capacity $1,595

Equipment of all the Mitchell Models Included in the List Prices Here Given

Electric self-starter and generator—elecric lights—electric horn—electric magnetic exploring lamp—speedometer—mohair top and dust cover—Jiffy quick-action side curtains—quick-action rain vision wind-shield—demountable rims with one extra—tungsten valves—double extra tire carriers—Bair bow holders—license plate bracket—pump, jack and complete set of tools. Prices F. O. B. Racine.

FACTS ABOUT FOODS.—No. 2.

By Mrs. C. W. Foulk.

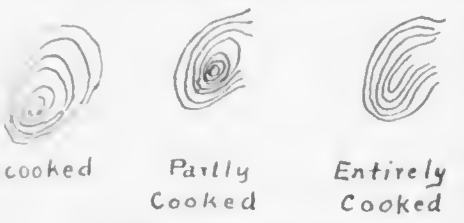
Starchy Foods

All starchy foods belong to the class of foods known as carbohydrates, and therefore energy and heat producers. Food obtained from grains, such as rice, all kinds of breakfast foods, cornstarch and flour, and many of the vegetables, as potatoes, sweet potatoes, etc., are largely starch.

If a raw potato is grated, put under the microscope and examined, it will be found to be made up of numerous small grains resembling the first degree in the accompanying diagram. The lines in this diagram represent thin layers of wood or cellulose, and the spaces between these layers of woody tissue contain the starch itself. All starchy foods are made up of these small starch grains, which while they differ slightly in size and shape, according to the plant from which they are obtained, are always formed of alternating layers of wood (cellulose) and starch. This woody layer is exactly the same material as the wood in bran or twigs, and we know that while some animals are able to digest young twigs and also bran, the human animal is not.

Cereals

Because of the fact that starch grains are so formed, all foods containing starch must be cooked long enough and in moisture enough to break these layers of wood and set the starch free.



A GRAIN OF POTATO STARCH.

For example, let us take the making of cornmeal mush. The mush will look done, and may even taste done long before all of the starch is sufficiently cooked to be digestible. The outer layer of the grains may be broken giving the mush the appearance of being done, while the inner layers are still uncooked. Cornmeal mush must cook at least three hours to render the starch digestible. A fireless cooker affords the best way of thoroly cooking cornmeal with little trouble.

It is always poor economy to save on labor and fuel at the expense of digestion, for not only will the digestive system be over-taxed, but in order to get enough nourishment more food will be eaten, because part of the uncooked starch will pass thru the body unaltered and be given off as waste without in any way nourishing the body. Even in rare cases where no injury is done by the eating of poorly cooked foods, they are, to say the least, extravagant.

There are many cereal preparations now on the market which have been wholly or partly cooked in their manufacture. Directions given on the boxes give the time necessary to complete the cooking. It has been found, however, that the time given is often insufficient to properly cook the starch in these, and it is always safer to allow a little extra time. There is no class of foods that is at present more extensively advertised, and all sorts of claims are made as to their merits. Some are advertised as brain foods, others as muscle builders, etc.; all of these claims are misleading, except in so far as any energy producing food, any carbohydrate, is a brain food; or as any protein food is a muscle maker.

Oatmeal, when thoroly cooked, is nutritious, for along with the large amount of starch which it contains, there is present also some fat (heat producer), some proteids (muscle builders) and some necessary mineral matter. Owing to the large amount of woody tissue it contains, oatmeal is somewhat laxative, and will be helpful to persons troubled with constipation. It is a hearty food, and those who eat much of it should live vigorous outdoor lives; much of it is a much better food for the farmer than for the student or the lawyer. If insufficiently cooked and given to young children it will often cause colic, gas on the stomach and rashes. Many a poor child has been blamed as a dull one in school when the real cause has been too much poorly cooked oatmeal for breakfast. The blood being in the stomach, it can not be in the head, helping the child to think.

Corn is also a wholesome cereal, for it contains fat and muscle builder as well as starch. Because of the large amount of fat it contains corn furnishes heat to the body as well as energy, and corn meal in various forms makes a good food for winter. Corn, as is well known, is fattening, and should be avoided by overly fat people.

Roasting ears or corn on the cob are not easily digested because of the toughness of the kernel husks, and often pass thru the body unaltered by the action of the digestive juices. For this reason green corn may cause indigestion and diarrhea.

Corn meal, like oatmeal, when properly cooked is quite digestible and like oatmeal it is slightly laxative. There are two kinds of corn meal, yellow and white; their food value is practically the same, altho it is generally thought that yellow meal is a little sweeter.

Cornstarch is almost entirely starch, the fat and muscle builder (proteids) having been removed. Cornstarch pudding makes a wholesome dessert for growing children.

Rice contains more starch than any other cereal, and it is in an exceedingly digestible form, and for this reason it makes a good food for children and people with weak digestion. Rice is a cheap food; it keeps well, and furnishes a large amount of digestible starch, and its use should be more general than it is in the northern part of this country. It must be kept in mind, however, that rice contains no muscle builder or fat, and so it is wise to serve it with some animal food, such as meat, eggs or cheese. Rice cooked with cheese makes a well balanced dish.

Wheat is the most important of our cereal foods, and because of its use as a bread-stuff, it will be considered in a separate talk. But a word about wheat as a breakfast food. There are many prepared breakfast foods made from wheat, and these are wholesome, nutritious and when cooked carefully are easily digested. The whole wheat grain, if washed and cooked until gelatinous, (this will take four or five hours—best done in fireless cooker), makes a good cereal food and is beneficial to people troubled with chronic constipation.

Macaroni is a wheat product. It contains more gluten (a muscle builder) and less starch than does flour. It is wholesome and easily digested, is cheap and keeps well. Macaroni should be used more widely by farm folks than it is at present. Many people think the more expensive imported brands much superior to the domestic brands, but when we consider that much of the imported product is made from American wheat, there seems to be little reason for thinking that there is any difference. The imported macaroni is white, due to its being dried in hotter sunlight of southern Europe, but American Macaroni is dried in a much more sanitary manner. Combined with cheese, macaroni makes a well balanced dish. Macaroni and tomato sauce is also a wise combination, as the tomatoes furnish salts and acids that are lacking in the macaroni.

Tapioca is a starchy food but not a cereal. It is the product of the root of the cassava, a tropical plant, our supply coming largely from the West Indies, altho it is now grown to some extent in Florida. Tapioca is almost pure starch and the starch granules are not tough, hence are easily digested. It makes a good food for children, and it is a safe food to eat in cases of diarrhea. Pearl tapioca is not tapioca, but is made from potato starch.

TIME TABLE FOR COOKING CEREAL FOODS

Kind	Amount	Water	Time
Steamed or Rolled Oats	1 Cup	1¾ Cups	30 min.
Coarse Oatmeal	1 Cup	4 Cups	3 hours
Rice	1 Cup	2¾ to 3¼ Cups	40 to 60 mins
Cornmeal	1 Cup	3½ Cups	3 hours
Hominy	1 Cup	4 Cups	1 hour
Whole Wheat	1 Cup	4 Cups	4 hours

Some Recipes For Cooking Starchy Foods

Abbreviations in the following directions are: c, cup; tbsp, tablespoonful; ts, teaspoonful.

Delicate Pudding (Cornstarch).—1 c water, 1 c fruit juice or milk, 6 tbsp (level) cornstarch, pinch of salt, 3 egg whites, 3 tbsp sugar.

Wet the cornstarch with a little of the liquid, stir it into the remaining liquid which has been heated, add the sugar and salt, cook 15 minutes, remove from fire, and add the beaten egg whites, turn into a mold which has been wet with cold water. Serve with cream and sugar, or with a boiled custard.

Tapioca Custard.—2 tbsp tapioca, 1 pt milk, yolks of 2 eggs, 1-3 c sugar, pinch of salt, whites of 2 eggs, ½ ts vanilla.

Cook tapioca in a double boiler in just enough water to cover it; when the water is absorbed add the milk and cook until the tapioca becomes soft and transparent. Beat the yolks, add the sugar and salt, pour the boiling milk over them, return to the double boiler and cook until it thickens like a custard. Remove from the fire, add the egg whites beaten to a foam, stir well and flavor.

Macaroni with White Sauce.—¾ c macaroni broken in inch pieces, 2 tbsp butter, 2 tbsp flour, 2 qt. boiling water, 1 tbsp salt, 1½ c milk.

Cook macaroni in boiling salted water for 20 minutes or until soft, drain in strainer, pour cold water over it to prevent pieces from sticking together, add white sauce made as follows: Melt 2 tbsp butter, add 2 tbsp flour and pour into this 1½ c scalded milk; cook 5 minutes.

Rice With Cheese.—Steam 1 c of rice, allowing 1 tbsp salt and 2¾ to 3¼ c boiling water; cover the bottom of buttered dish with rice, dot over with ¾ tbsp of butter, sprinkle with thin shavings of mild cheese and a few grains of cayenne pepper; repeat until the rice and ¼ lb. of cheese are used. Add milk to half the depth of contents of the dish, cover with buttered crumbs and bake until the cheese melts.

Cream of Tomato Soup.—Stew together in a saucepan one quart of tomatoes, one slice of onion, a few small red peppers, two or three cloves and part of a bay leaf. A stalk or two of celery can be added if liked. Boil for twenty minutes, then pass thru a sieve. Blend together over the fire two tablespoonfuls of butter and the same amount of flour. When cooked, add one pint of milk, stirring constantly. Season the tomatoes with salt, pepper and sugar while boiling. Just before combining the thickened milk and tomatoes add a half teaspoonful of soda to the tomatoes. Serve with crackers.

PENNSYLVANIA FARMER PATTERNS.

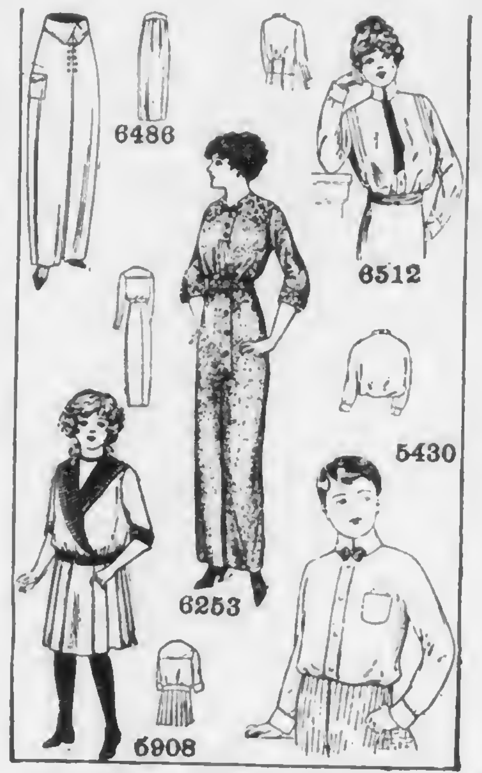
Be sure to give the figures and letters of each pattern exactly as printed at the beginning of each description. We will not be responsible for correct filling of your orders unless you do so. Also give bust measure when ordering waist patterns, waist measure for skirt, and age for children's patterns. Address Pennsylvania Farmer, 214-18 So. 12th St., Philadelphia, Pa.

6486—Ladies' Three-Gored Skirt.—Cut in sizes 22 to 32 inches, waist measure. Size 24 requires 3½ yards of 36-inch material. Price of pattern, 10 cents.

6253—Ladies' Dress.—Cut in sizes 34 to 42 inches, bust measure. Size 36 requires 5 yards of 36-inch material and ¾ yard of 27-inch contrasting goods. Price, 10 cents.

6512—Ladies' Shirt Waist.—Cut in sizes 34 to 44 inches, bust measure. Size 36 requires 2½ yards of 36-inch material. Price, 10 cents.

5908—Girls' Dress.—Cut in sizes 6 to 12 years. Age 8 years requires 3¼ yards of 36-inch material and ¾ yards of 24-inch contrasting goods. Price, 10 cents.



5430—Boys' Blouse.—Cut in sizes 4 to 10 years. Age 6 years requires 1¼ yards of 36-inch material. Price, 10 cents.

Winston of the Prairie

By HAROLD BINDLOSS

Copyrighted by Frederick A. Stokes Company.

CHAPTER XXIII

Sergeant Stimson Confirms His Suspicions

It was late in the afternoon when Colonel Barrington drove up to Winston's homestead. He had his niece and sister with him, and when he pulled up his team, all three were glad of the little breeze that came down from the blueness of the north and rippled the whitened grass. It had blown over leagues of sun-bleached prairie, and the great desolation beyond the pines of the Saskatchewan, but had not wholly lost the faint, wholesome chill it brought from the Pole.

There was no cloud in the vault of ether, and slanting sun-rays beat fiercely down upon the prairie, until the fibrous dust grew fiery and the eyes ached from the glare of the vast stretch of silver gray. The latter was, however, relieved by stronger color in front of the party for blazing gold on the dazzling stubble, the oat sheaves rolled away in long rows that diminished and melted into each other, until they cut the blue of the sky in a delicate filigree. Oats had moved up in value in sympathy with wheat, and the good soil had most abundantly redeemed its promise that year. Colonel Barrington, however, sighed a little as he looked at them, and remembered that such a harvest might have been his.

"We will get down and walk towards the wheat," he said. "It is a good crop and Lance is to be envied."

"Still," said Miss Barrington, "he deserved it, and those sheaves stand for more than the toil that brought them there."

"Of course!" said the Colonel, with a curious little smile. "For rashness, I fancied, when they showed the first blade above the clod, but I am less sure of it now. Well, the wheat is even finer."

A man who came up took charge of the horses, and the party walked in silence towards the wheat. It stretched before them in a vast parallelogram, and while the oats were the pale gold of the austral, there was the tint of the ruddier metal of their own Northwest in this. It stood tall and stately, murmuring as the sea does, until it rolled before a stronger puff of breeze in waves of ochre, thru which the warm bronze gleamed when its rhythmic patter swelled into deeper-toned harmonies. There was that in the elfin music and blaze of color which appealed to the sensual ear and eye, and something which struck deeper still, as it did in the days men poured libations on the fruitful soil, and white-robed priests blessed it, when the world was young.

Maud Barrington felt it vaguely, but she recognized more clearly, as her aunt had done, the faith and daring of the sower. The earth was very bountiful, but that wheat had not come there of itself; and she knew the man who had called it up and had done more than bear his share of the primeval curse which, however, was apparently more or less evaded at Silverdale. Even when the issue appeared hopeless, the courage that held him resolute in the face of others' fears, and the greatness of his projects, had appealed to her, and it almost counted for less that he had achieved success. Then glancing further across the billowing grain she saw him—still as it seemed it had always been with him, amid the stress and dust of strenuous endeavor.

Once more, as she had seen them when the furrows were bare at seed time, and there was apparently only ruin in store for those who raised the Eastern people's bread, lines of dusty teams came plodding down the rise. They advanced in echelon, keeping their time and distance with a military precision, but in place of the harrows, the tossing arms of the binders flashed and swung. The wheat went down before them, their wake was strewn with gleaming sheaves, and one man came foremost swaying in the driving-seat of a rattling machine. His face was the color of a Blackfeet's, and she could see the darkness of his neck above the loose-fronted shirt, and a bare blackened arm that was raised to urge the tired beasts to their task. Their trampling, and the crash and rattle that swelled in slow crescendo, drowned the murmur of the wheat, until one of the machines stood still, and the leader, turning a moment in his saddle, held up a hand. Then those that came behind swung into changed formation, passed, and fell into indented line again, while Colonel Barrington nodded with grim approval.

"It is very well done," he said. "The best of harvesters! No newcomers yonder. They're capable Manitoba men. I don't know where he got them, and, in any other year, one would have wondered where he would find the means of paying them. We have never seen farming of this kind at Silverdale."

He seemed to sigh a little while his hand closed on the bridle, and Maud Barrington fancied she understood his thoughts just then.

"Nobody can be always right, and the good years do not come alone," she said. "You will plow every acre next one."

Barrington smiled dryly. "I'm afraid that will be a little late, my dear. Any one can follow, but since, when everybody's crop is good, the price comes down, the man who gets the prize is the one who shows the way."

"He was content to face the risk," said Miss Barrington.

"Of course," said the Colonel quietly. "I should be the last to make light of his foresight and courage. Indeed, I am glad I can acknowledge it, in more ways than one, for I have felt lately that I am getting an old man. Still, there is one with greater capacities ready to step into my shoes, and tho it was long before I could overcome my prejudice against him, I think I should now be content to let him have them. Whatever Lance may have been, he was born a gentleman, and blood is bound to tell."

Maud Barrington, who was of patrician parentage, and would not at one time have questioned this assertion, wondered why she felt less sure of it just then.

"But if he had not been, would not what he has done be sufficient to vouch for him?" she said.

Barrington smiled a little, and the girl felt that her question was useless as she glanced at him. He sat very straight in his saddle, immaculate in dress, with a gloved hand on his hip, and a stamp which he had inherited, with the thinly-covered pride that usually accompanies it from generations of a similar type, on his clean-cut face. It was evidently needless to look for any sympathy with that view from him.

"My dear," he said, "there are things at which the others can beat us; but, after all, I do not think they are worth the most, and while Lance has occasionally exhibited a few undesirable characteristics, no doubt acquired in this country, and has not been always blameless, the fact that he is a Courthorne at once covers and accounts for a good deal."

Then Winston recognized them, and made a sign to one of the men behind him as he hauled his binder clear of the wheat. He had dismounted in another minute, and came towards them, with the jacket he had not wholly succeeded in struggling into, loose about his shoulders.

"It is almost time I gave my team a rest," he said. "Will you come with me to the house?"

"No," said Colonel Barrington. "We only stopped in passing. The crop will harvest well."

"Yes," said Winston, turning with a little smile to Miss Barrington. "Better than I expected, and prices are still moving up. You will remember, madam, who it was wished me good fortune. It has undeniably come!"

"Then," said the white-haired lady, "next year I will do as much again, tho it will be a little unnecessary, because you have my good wishes all the time. Still, you are too prosaic to fancy they can have anything to do with—this."

She pointed to the wheat, but, tho Winston smiled again, there was a curious expression in his face as he glanced at her niece.

"I certainly do, and your good-will has made a greater difference than you realize to me," he said.

"Better than leather For all kinds of weather"

Wear these Hub-Mark Bootees and Save

1st. Save money—they cost no more than leather work shoes, and lower your footwear cost by giving longer service.

2nd. Save yourself the discomforts of wet, cold feet.

3rd. Save the trouble of drying shoes.

4th. Save yourself the aches and pains that come from corns, bunions, callouses, and the chafing and blistering of stiff leather shoes.

5th. Save the expense of doctor's bills due to rheumatism, chilblains, coughs, colds, pneumonia, etc.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

Miss Barrington looked at him steadily. "Lance," she said, "there is something about your speeches that occasionally puzzles me. Now, of course, that was the only rejoinder you could make, but I fancied you meant it."

"I did," said Winston, with a trace of grimness in his smile. "Still, isn't it better to tell any one too little rather than too much?"

"Well," said Miss Barrington, "you are going to be franker with me by and by. Now, my brother has been endeavoring to convince us that you owe your success to qualities inherited from bygone Courthornes."

Winston did not answer for a moment, and then he laughed. "I fancy Colonel Barrington is wrong," he said. "Don't you think there are latent capabilities in every man, tho only one here and there gets an opportunity of using them? In any case, wouldn't it be pleasanter for any one to feel that his virtues were his own and not those of his family?"

Miss Barrington's eyes twinkled, but she shook her head. "That," she said, "would be distinctly wrong of him, but I fancy it is time we were getting on."

In another few minutes Colonel Barrington took up the reins, and as they drove slowly past the wheat, his niece had another view of the toiling teams. They were moving tirelessly with their leader in front of them, and the rasp of the knives, trample of hoofs, and leash of the binders' wooden arms once more stirred her. She had heard those sounds often before, and attached no significance to them, but now she knew a little of the stress and effort that preceded them, she could hear thru the turmoil the exultant note of victory.

Then the wagon rolled more slowly up the rise, and had passed from view behind it, when a mounted man rode up to Winston with an envelope in his hand.

"Mr. Macdonald was in at the settlement and the telegraph clerk gave it to him," he said. "He told me to come along with it."

Winston opened the message, and his face grew grim as he read, "Send me five hundred dollars. Urgent."

Then he thrust it into his pocket, and went on with his harvesting when he had thanked the man. He also worked until dusk was creeping up across the prairie before he concerned himself further about the affair, and then the note he wrote was laconic.

"Enclosed you will find fifty dollars, sent only because you may be ill. In case of necessity you can forward your doctor's or hotel bills," it ran.

It was with a wry smile he watched a man ride off towards the settlement with it. "I shall not be sorry when the climax comes," he said. "The strain is telling."

In the meanwhile Sergeant Stimson had been quietly renewing his acquaintance with certain ranchers and herders of sheep scattered across the Albertan prairie some six hundred miles away. They found him more communicative and cordial than he used to be, and with one or two he unbent so far as, in the face of the regulations, to refresh himself with whiskey which had contributed nothing to the Canadian revenue. Now the lonely ranchers have as a rule few opportunities of friendly talk with anybody, and as they responded to the sergeant's geniality, he became acquainted with a good many facts, some of which confirmed certain vague suspicions of his, tho others astonished him. In consequence of this he rode out one night with two or three troopers of a Western squadron.

His apparent business was somewhat prosaic. Musquash, the Blackfeet, in place of remaining quietly on his reserve, had in a state of inebriation reverted to the primitive customs of his race, and taking the trail, not only annexed some of his white neighbors' ponies and badly frightened their wives, but drove off a steer with which he feasted his people. The owner following came upon the hide, and Musquash, seeing it was too late to remove the brand from it, expressed his contrition, and pleaded in extenuation that he was rather worthy of sympathy than blame, because he would never have laid hands on what was not his had not a white man sold him deleterious liquor. As no white man is allowed to supply an Indian with alcohol in any form, the wardens of the prairie took a somewhat similar view of the case, and Stimson was, from motives which he did not mention especially anxious to get his grip upon the other offender.

The night when they rode out was very dark, and they spent half of it beneath a birch bluff, seeing nothing whatever, only hearing a coyote howl. It almost appeared there was something wrong with the information supplied them respecting the probable running of another load of prohibited whisky, and towards morning Stimson rode up to the young commissioned officer.

"The man who brought us word has either played their usual trick and sent us here while his friends take the other trail, or somebody saw us ride out and went south to tell the boys," he said. "Now, you might consider it advisable that I and one of the troopers should head for the ford at Willow Hollow, sir."

"Yes," said the young officer, who was quite aware that there were as yet many things connected with his duties he did not know. "Now I come to think of it, Sergeant, I do. We'll give you two hours, and then, if you don't turn up, ride over after you; it's condemnably shivery waiting for nothing here."

Stimson saluted and shook his bridle, and rather less than an hour later faintly discerned a rattle of wheels that rose from a long way across the prairie. Then he used the spur, and by and by it became evident that the drumming of their horses' feet had carried far, for, tho the rattle grew a little louder, there was no doubt that whoever drove the wagon had no desire to be overtaken. Still, two horses cannot haul a vehicle over a rutted trail as fast as one can carry a man, and when the wardens of the prairie raced towards the black wall of birches that rose higher in front of them, the sound of wheels seemed very near. It, however, ceased suddenly, and was followed by a drumming that could have been made by a galloping horse.

"One beast!" said the Sergeant. "Well, they'd have two men, anyway, in that wagon. Get down and picket. We'll find the other fellow somewhere in the bluff."

They came upon him within five minutes endeavoring to cut loose the remaining horse from the entangled harness in such desperate haste that he did not hear them until Stimson grasped his shoulder.

"Hold out your hands," he said. "You have your carbine ready, trooper?"

The man made no resistance, and Stimson laughed when the handcuffs were on.

"Now," he said, "where's your partner?"

"I don't know that I mind telling you," said the prisoner. "It was a low down trick he played on me. We got down to take out the horses when we saw we couldn't get away from you, and I'd a blanket girthed round the best of them, when he said he'd hold him while I tried what I could do with the other. Well, I let him, and the first thing I knew he was off at a gallop, leaving me with the other kicking devil two men couldn't handle. You'll find him rustling south over the Montana trail."

"Mount and ride!" said Stimson, and when his companion galloped off, turned once more to his prisoner.

"You'll have a lantern somewhere, and I'd like a look at you," he said. "If you're the man I expect, I'm glad I found you."

"It's in the wagon," said the other dejectedly.

Stimson got a light, and when he had released and picketed the plunging horse, held it so that he could see his prisoner. Then he nodded with evident contentment.

"You may as well sit down. We've got to have a talk," he said.

"Well," said the other, "I'd help you catch Harmon if I could, but I can prove he hired me to drive him over to Kemp's in the wagon, and you'd find it difficult to show I knew what there was in the packages he took along."

Stimson smiled dryly. "Still," he said, "I think it could be done, and I've another count against you. You had one or two deals with the boys some little while ago."

"I'm not afraid of your fixing up against me anything I did then," said the other man.

"No?" said Stimson. "Now, I guess you're wrong, and it might be a good deal more serious than whisky-running. One night a man crawled up to your homestead thru the snow, and you took him in."

He saw the sudden fear in his companion's face before he turned it from the lantern.

"It has happened quite a few times," said the latter. "We don't turn any stranger out in this country."

(To be continued.)

Honest Value in Rubber Footwear

"BALL (Red) BAND"

The name "Ball-Band" stands for dry, comfortable feet. It's the trade mark of rubber footwear that eight million men recognize as the best they can buy. It gives them more days' wear for dollars invested.

Making good rubber footwear is no job for a careless man. The goods we make are going to get terrific hard wear, and we know it. We build "Ball-Band" Footwear to stand that wear.

Forty-five thousand dealers sell "Ball-Band" Rubber and Woolen Footwear. Look for the Red Ball on the goods and in the store windows. Your dealer will probably say as much for our boots as we do. If he can't supply you, write us and we'll tell you who can. Write anyway for Free Illustrated Booklet describing "Ball-Band" Footwear.

Markets

PHILADELPHIA PRODUCE

Philadelphia, Pa., Feb. 23, 1914.

Supplies of fine butter stock were under good control. Receipts of fancy prints were kept well cleaned up and values ruled firm. There was little trading in the egg market, but prices were well maintained under moderate receipts. Demand was sufficient to readily absorb the limited receipts of fine desirable poultry stock. Trade in fruit and vegetables was quiet

Butter.—Western creamery, 33c; extras, 31c; firsts to seconds 25@29c; special prints 37@40c; near-by prints, 34c.

Eggs.—Candled, 32@35c doz; extras, 30c. Current receipts at $8.10 per standard case.

Poultry.—Fowls, 18@19c; old roosters, 12@13c; pigeons, 28@32c pair.

Dressed Poultry.—Western fowls, 12@19½c; roosters, 15c; turkeys, 21@26c; squabs $2@4.85 doz.

Vegetables.—White potatoes, Pa., 80c@$1 bu. Onions $3@3.25 per 100-lb bag. Peppers $1.75@2 per carrier. Eggplant $2.00@3.50 per box. Lettuce $1@3.50 hamper. Beets, new 5@7c bch. Sweet potatoes, 45@60c bas. String beans, $2.00@3.50 hamper. Squash, $1.50@2.00 box. Cucumbers, Florida $4@5 hamper. Celery, 50@75c per doz. stalks. Cabbage, new $1.75@2 ½-bbl crate. Cauliflower, $1.25@1.75 hamper.

Fruit.—Apples $3.00@6 bbl. Pineapples, per crate, $2.50@3.50. Pears, 50@75c bas. Grapes $4@7 keg; cranberries, $3.00@3.50 box; lemons, $2.00@3 per box; grape fruit $2@4 per box; oranges, $2@3 per box.

Hay and Grain.—No. 3 hay, large bales, $18.00@18.50; No. 1 medium $17.50@18; no grade, $10.00@12.00. Clover mixed hay, light mixed at $16.50@17.00; straw No. 1 new straight rye, $16.50; No. 2 do., $15@15.50; No. 1 tangled rye straw new $12; No. 2 do., $11.00@11.50; No. 1 wheat straw, $10@10.50; No. 1 oat straw, $10.50@11.00; new shelled corn No. 2 yellow, 72@73c. Wheat No. 2 red, 99½c@$1; No. 1 Northern, $1.04½@1.05½; No. 2 white oats, 45@45½c; No. 3, white 45½@46c Standard white, 45@45½c.

Coffee.—Rio 7s 9¼c; Santos 4s 11⅞c. Mild Coffee.—Cordova, 13@16c.

Sugar.—Cut loaf, $5.10 cwt.; cubes, $4.35; powdered, $4.20; granulated, $4.10; standard granulated, $4.15; crystal A, $4.10.

PITTSBURGH LIVE STOCK

Pittsburgh, Pa., Feb. 23, 1914.

With cold weather thruout the week and a good active demand prices moved higher Good choice steers are moving easily and fair to medium grades are in good demand. Today's receipts were 85 carloads. With an active demand there was another advance in top grades.

Good to choice	$8.95@9.10
Good 1,300-1,400 lb	8.50@8.85
Medium to good 1,200-1,300 lb.	8.10@8.35
Tidy 1,050-1,150 lb.	8.20@8.40
Fair to medium, 900-1,100 lb.	7.60@8.00
Rough, half-fat, 1,000-1,300 lb.	5.00@7.00
Common to good fat oxen	4.00@6.50
Common, 700-900 lb.	5.50@6.50
Common to good fat bulls	5.00@7.50
Common to good fat cows	4.00@6.50
Heifers	5.50@7.75
Bologna cows	3.50@4.25
Fresh cows and springers	25.00@90.00

Calves hold steady under fairly liberal supplies and good inquiry. There was a good clearance today at steady prices.

Heavy and thin calves	$5.50@ 8.00
Veal calves	8.50@12.00

There has been an advance in sheep prices. Receipts are only normal and there has been a fair inquiry. Last week saw an advance of from 10 to 15 cents. With 18 double-deck loads on sale today both sheep and lambs held firm at last week's close.

Prime wethers	$6.15@6.40
Good mixed	5.40@5.65
Fair mixed ewes and wethers	4.25@5.00
Culls to common	3.00@3.50
Spring lambs	5.50@8.15

The hog market remains steady on the heavy grades. Yorkers and pigs made an advance of about 10 cents during the past week under good inquiry. Today's receipts were 55 double-deck loads. There was active trading at steady prices.

Prime heavy	$9.10@9.15
Prime medium weights	9.20@9.30
Heavy mixed	9.20@9.30
Best heavy Yorkers	9.20@9.30
Light Yorkers	9.00@9.15
Pigs	9.20@9.30
Common to good roughs	8.00@8.50
Stags	6.75@7.25

BALTIMORE LIVE STOCK

Baltimore, Md., Feb. 23, 1914.

Cattle.—Receipts for the week 2,131 head against 2,408 last week.

Steers	$6.25@8.35
Heifers	5.50@7.25
Cows	3.00@6.25
Bulls	5.25@7.00
Fresh cows	35.00@80.00

Sheep and lamb receipts for the week were 3,284 head against 4,470 last week. Fair supply; market steady.

Sheep	$3.50@6.25
Lambs	5.75@8.40

Hog receipts for the week were 13,742 head against 15,549 last week.

Light western	$9.55@9.70
Heavy to medium	9.50@9.70
Near-by	9.40@9.60
Pigs	9.15@9.40

Calves.—Receipts for the week were 317 head, against 219 head last week. Light supply, market higher at $6.00@12.00.

BUFFALO LIVE STOCK

Buffalo, N. Y., Feb. 23, 1914.

The cattle trade held steady last week The cold weather kept demand active but prices showed little change. There is a good supply of finished cattle coming in and the demand for this class holds good. There were 5,600 head on sale today. Prices moved a little lower than at the close of last week. There was an active trade.

Choice heavy steers	$8.85@9.00
Medium	8.25@8.75
Yearlings	8.00@8.50
Handy butchers	7.50@8.35
Good to choice fat cows	6.50@7.25
Good to choice heifers	7.50@8.00
Butcher bulls	6.00@7.50
Feeders	6.25@7.00
Stockers	5.00@6.25
Cows and springers	35.00@85.00

Calves continue active with a good general demand. Prices are firm at a high figure. There were 800 head on sale today. The demand kept prices firm at last week's quotations.

Choice veals	$12.50@13.00
Lights and thin	6.00@ 8.75

Sheep have been marketed in liberal numbers in recent weeks. The trade last week was active but prices moved lower on sheep and whethers. There were 20,000 head on sale today. The market was quiet at steady prices.

Choice lambs	$8.00@8.25
Yearlings	7.00@7.25
Wethers	6.25@6.50
Ewes	5.75@5.85
Sheep	5.75@6.00

The cold weather keeps the hog market firm. Trade was active thruout the week and prices moved upward, well-finished hogs with weight are at a premium. Today's receipts were 16,000 head. The market was active at higher prices.

Heavies	$9.20@9.25
Mixed and medium	9.20@9.25
Yorkers	9.25@9.30
Light Yorkers	9.25@9.30
Pigs	9.25@9.30
Roughs	8.25@8.40
Stags	6.50@7.50

NEW YORK LIVE STOCK.

New York City, Feb. 23, 1914.

Beef Cattle.—Receipts for week 800 head. Market firm.

Steers	$6.00@9.25
Bulls	5.50@7.75
Cows	3.75@7.00
Dressed beef	12½@14c.

Spring lambs	7.25@8.25

Hog receipts 1,600 head. Market higher. Choice, $9.25@9.50; roughs, $8.15@8.50.

NEW YORK MILK MARKET

New York City, Feb. 23, 1914.

The condition of the market has changed little in the course of the last week. The dealers have suffered to some extent by the delayed arrivals of milk trains held up by the heavy weather. The Homer Ramsdell Line carried no milk, as its boats made only three trips. There have been no prosecutions of those dealers who have not met the requirements for pasteurization of their supplies. Should the delinquent dealers show any indication of slowing up in their efforts to get the necessary machinery installed, however, it is promised that the sword will fall.

The receipt of milk and cream in 40-quart cans for the week ending February 21, were as follows:

Railroad	Milk	Cream
Erie	47,007	1,563
Susquehanna	10,049	486
West Shore	15,928	666
Lackawanna	51,850	1,320
N. Y. Central (long haul)	77,278	1,313
N. Y. Central (short haul)	11,820	87
Ontario	42,600	2,826
Lehigh Valley	36,813	745
Homer Ramsdell Line	....	....
New Haven	8,623	140
Pennsylvania	2,475	362
Other sources	1,660	15
Total	306,103	9,523

ELGIN BUTTER QUOTATION

Elgin, Ill., Feb. 23, 1914.

The quotation committee of the Elgin Board of Trade this afternoon declared butter steady at 30c.

NEW YORK HAY MARKET.

New York City, Feb. 21, 1914

The market for hay ruled very steady. Receipts are running light but stocks are liberal at all points. Demand is moderate. Receipts today were 517 tons. Timothy, No. 1, $1.05 bale; standard 97½@$1; No. 2, 90@95; No. 3, 80@85c; clover 85@95c.

Straw.—Straw remains generally quiet. Receipts 20 tons. Oats straw 50@55c bale; rye 85@90c.

TOBACCO MARKET

There was little business during the week owing largely to the first real winter weather of the season. Some sales, however, were reported as having been made during this time or possibly a few days earlier. Following are some of them: Several hundred acres in Manor Township at $9@10 per cwt; 8 acres near Mt. Joy at $8.50@$2, and 8 acres at $9@$2 per cwt. 65 acres at Quarryville at $8@$2 per cwt and higher. The average of reports shows that prices range from $8 to $10 per cwt for wrappers and about $2 for fillers.

The general tobacco market as reported from New York was unusually active in all types of leaf tobacco. Buyers are willing to pay all that is asked and slight advances are noted from time to time. Altho the cigar output shows a decrease as compared with last year manufactures are quite optimistic as to the future and accordingly are laying in extensive supplies of raw material. The new crop in the state of New York is now off the poles and ready for market. Prices being paid there are such as to impart great interest and a large crop will be planted the present year. In Wisconsin but a small part of crop has been delivered but the larger part has been sold; the sow movement being due to cold winter weather. In Connecticut the situation is very active owing to the satisfactory price at which the 1913 crop was sold and it is predicted that a record crop will be grown the present year. There is little activity in the Ohio cigar section. Growers, however, are almost thru stripping.

Much interest is expressed in a recent Government bulletin treating "The Mosaic Disease of Tobacco" known as "calico," "walloon," "chlorosis," "mottled top," "split worm" and "leaf miner," these local names being more descriptive than correct. In some sections this parasitic disease has become quite troublesome and drastic measures of eradication should be employed wherever it is found or it may become as serious a menace to our tobacco fields as the boll-weevil is to the cotton fields of the south. Among the preventive measures suggested are the prompt destruction of tobacco stubble, the cleaning up and burning of all litter about tobacco sheds and the growth of potatoes as far as possible from tobacco fields. The symptoms of the disease are blighted blossoms and leaves dwarfed, distorted, blistered and mottled, sometimes ruining the whole plant and at others the uppermost leaves only.—H. E. Tweed, February 23, 1914.

VALUABLE FREE CATALOGS

Breeding Big Crops.—There have been many "systems" passed out to farmers in recent years as cures for all production ills. Many have disappeared as quickly as introduced because they could not stand the acid test of practice. The most notable exception is the Chatham System of Breeding Big Crops. It remains and is growing with the years because it is right in principle and deals with a fundamental feature—the seeds you sow or plant. A new handsomely illustrated booklet tells all about this system and how it may be practiced by every farmer in getting better and cleaner seed. The booklet is free for the asking. A postal-card request to the Manson Campbell Co., Dept. 72, Detroit, Mich., brings it.

"New Way To Buy By Mail".—The United Factories Co., 315 Factory Building, Cleveland, Ohio, is providing a system whereby consumers can buy products from different factories direct under a safe guarantee and an opportunity to examine the goods before a payment is made. A new catalog, showing the products of 33 different factories, including paints, roofing, wall board, shingles, buggies, harness, engines, fencing, furniture, and many other items, will be sent free upon request to the above address. Their advertisement appears on page 20 of this issue.

Vegetable Tapes. — Vegetable growers who appreciate the value of an added touch to the appearance of their products on the markets will be interested in investigating bunching tapes put out by the Wick Narrow Fabric Co., 933 Market St., Philadelphia, Pa. The tape is cheap and may be purchased in fast colors preferred. Their use adds nothing to the quality of the product, of course, but gives the bit of "finish" which usually brings a few cents more for the commodity on the market.

Atlas Farm Powder.—"Better Farming With Atlas Farm Powder" is the title of a valuable 65-page book now being distributed free by the Atlas Powder Company. The book discusses the use of powder in subsoiling, drainage, tree planting, stumping, rock crushing, excavating, etc. It gives complete descriptions for handling of powder in these various uses and is fully illustrated The book is sent free upon request to the Atlas Powder Co., Dept. Pa. F. 21, Wilmington, Del.

Plant Setter.—It will soon be time for setting and transplanting spring plants. Now is the time to investigate plant setters and prepare to care for the work with the least hired help. Masters Rapid Plant Setter is something new which sets all kinds of plants in water and covers the roots at one operation. It is completely described in circular matter sent free upon request if you write for it. Address Masters Planter Co., Dept. F., 150 W. South Water St., Chicago, Ill.

Garden and Poultry.—The 34th annual catalog issued by John W. Hall, Marion Station, Md., lists a full line of sweet potatoes, strawberry plants, seed corn, asparagus roots and poultry. Complete description and prices are given. The catalog will be sent free to all who write for it to the above address. Mention Pennsylvania Farmer.

Corn 11 Cents A Bushel.—At Milwood Farm, Framingham, Mass., 6 acres of corn grown on Bowker's Stockbridge Corn Manure exclusively, and charged with the cost of taxes, seed, fertilizer, plowing, planting, harrowing, cultivation, harvesting and husking, as well as stacking the fodder, and crediting the fodder at $8 per ton, gave shelled corn at a cost of about 14 cents per bushel.

Farm Implements.—Every farmer contemplating the purchase of a farm implement this spring should investigate the new catalog recently issued by Belsher and Taylor Agricultural Tool Co., Box 20, Chicopee Falls, Mass. The Stevens Broadcast Fertilizer Sower handled by this company is certain to fill a long neglected field. This machine sows all kinds of commercial fertilizers broadcast or in rows and is provided with a land guage which guages the amount of fertilizer applied per acre. The catalog also lists a full line of plows, harrows, ridgers and coverers, cultivators, weeders, rollers, corn planters, feed cutters, hay tedders, rakes, etc. The catalog is free upon request to the above address.

READ A GOOD SEED BOOK

At this time of the year the seed advertisers have published their catalogs for next spring and are offering them to our readers. Every farmer should get and read at least one of these books. They are full of helpful information concerning seeds and plants, treatment of the soil, etc. In buying seeds or nursery stock, it is well to get the order in early, even tho it is not to be shipped immediately, as the early orders are filled with the best stock. Look over the advertisements first.

USE THE RIGHT ADDRESS

When writing letters to advertisers, it is a good plan to use the correct address just as it is given in the advertisement. This will insure prompt delivery and immediate attention. Postal employes say that a very large amount of mail is wrongly addressed. The state or the street address, or both, will be omitted, or the town or city will be mis-spelled, or the firm name will be written and no address whatever given.

These are due to lapses of memory or to diverted attention, and to avoid them, one should refer to the advertisement, before addressing the envelope, and then copy the address just as it is given in the paper. Be sure to give your name and address in full. In our own mail it is surprising how many letters reach us, many containing orders, with incomplete addresses.

LEGAL QUERIES

Landlord and Tenant.—If a party rents a farm, and a third party holds the lease, has the landlord any right to go and get the lease and hold it for a week? Does such action break the lease or not? W. D., Lawrence, N. J.—Under the facts stated, (which are very indefinite) the action of the landlord in taking the lease cannot affect the validity of the lease. The execution and delivery of a lease gives the lessee an estate in the land for a certain period, and the possession of the paper itself is of little importance. Additional facts, such for example, as delivery by the landlord to a third party pending acceptance of an offer, might alter the case.

Big Saving.—During a recent outbreak of hog cholera in eastern Allegheny County, agents of the State Livestock Sanitary Board, under the direction of Dr. C. J. Marshall, State Veterinarian, vaccinated 350 hogs. The losses following this work were only about 3 percent as compared with a usual loss of nearly 80 percent in any active outbreak of this disease where serum treatment is not carried out by the Board; and in addition the spread of infection was checked.

Veterinary

(Conducted by W. C. Fair, V. S.)

(Advice thru this department is free to our subscribers. Each communication should state history and symptoms of the case in full; also the name and address of writer. Initials only will be published. When reply by mail is requested, it becomes private practice and a fee of $1 must accompany the letter. This is one of the most valuable columns of the paper and we invite readers to make use of it. Clippings from this column, when properly preserved and classified, would make one of the most valuable medical symposiums a farmer-stockman could obtain.)

Rheumatism.—I have 2 lame pigs. They are three and one-half months old. I first fed them milk and some middlings and corn meal, adding a small quantity of oil meal. Their food supply has principally consisted of milk and this mixture of meal since I have owned them. When two months old the largest one showed a little lameness. Some time later the other one went lame, but both of them have continued to grow and are at present apparently thriving. M. G. S., Arcade, N. Y.—Change their feed, giving less corn and give them some roots; also give each one 4 grains sodium salicylate and 5 grains powdered nitrate of potash at a dose, 3 or 4 times a day. Rub the lame leg with spirits of camphor, twice a day.

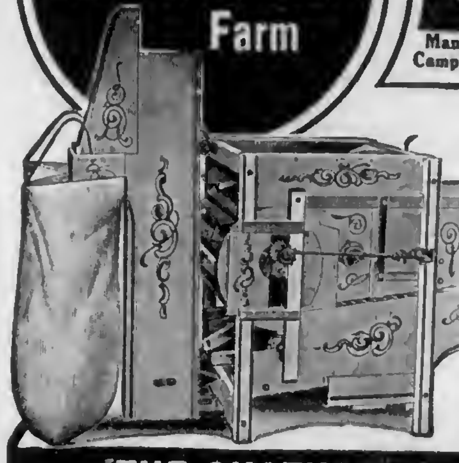
Sore Feet.—I have a young cow that is troubled with sore feet and most of the trouble appears to be between the toes. She is very lame, moves stiff, but has a good appetite. She came fresh five weeks ago, is some hide-bound, thin in flesh, but gives 6 quarts of milk at a milking. N. M. B., Selinsgrove, Pa.—First of all, thoroly disinfect stable floor, keep her stall clean and well bedded. Also apply 1 part powdered sulphate copper, 4 parts powdered alum and five parts oxide of zinc to sores, twice a day. Also apply calomel to sores, once a day. A piece of oakum should be placed between claws in order to keep our dirt. Another very good application is made by mixing 1 part iodoform in 9 parts of boracic acid, but this is objectionable on account of its odor.

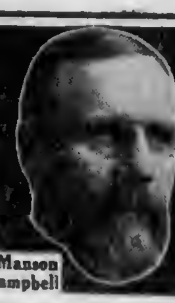
Cancerous Tumor.—I have a horse that has a bunch about the size of an orange on coronet which looks angry and sore, but it causes no lameness. This bunch first appeared 4 weeks ago, but no veterinarian was consulted until last week, and he refused to tackle it, claiming the case had been allowed to run too long. H. F. L., Birdsboro, Pa.—Either apply powdered sulphate of copper, chromic acid or burn it off with a red-hot iron; then, apply powdered alum twice a day. By applying tincture of iodine once a day and tincture of iron daily, you might be able to reduce bunch. In my practice I never hesitate to cut off a bunch of this kind, then treat it as a simple wound.

Eczema.—I have a 4-year-old colt that commenced to itch about a year ago, at which time I examined him for lice and found none. He continued to bite himself, especially his legs, and rub mane and tail. Last spring he was shedding, but during the summer he seemed better. Soon after stabling him this winter, this itchy condition of body reappeared. It is not unusual for his legs to bleed some. J. M. S., Cochranville, Pa.—He should be groomed well twice a day. Give him ½ oz. Donovon's solution at a dose in feed or water, 3 times a day. Feed him some roots, salt his feed and apply 1 part bichloride mercury and 1000 parts water to itchy parts of body, twice a day. Sprinkle on some finely powdered sulphur every day or two.

Ringbone.—I have a 14-year-old horse that has a bunch low down on right fore pastern. It is causing him to travel lame. I have applied liniment for a time and also blistered him with a commercial remedy, but he is no better. M. E. T., Sandy Lake, Pa.—A low-down ringbone usually causes serious lameness and is not easily cured. Your horse will travel better if shod with a rolling-motion shoe. Also apply 1 part red iodide of mercury and 4 parts lard every week or 10 days and if you do not need to work him give him absolute rest for 6 or 8 weeks.

Nodular Disease.—About a week ago one of my sheep died. I opened her and found a great many small bunches on bowels filled with a greenish substance. None of the other organs seemed to be diseased. Now I am at a loss to know what ailed this ewe. J. S. T., Girard, Pa.—Your ewe died of nodular disease. Give 5 grains powdered sulphate iron, 15 grains of ground gentian, 15 grains of ground ginger and 20 grains of salt at a dose in feed twice a day.





$1.00 Puts It On Your Farm

Manson Campbell

For $1.00, I Clean and Grade Your Seed Grain

THE CHATHAM Grain Grader and Cleaner

Handles 70 Kinds of Seed Grain and Grass Seed

From Wheat, it takes Wild Oats, Tame Oats, Cockle, Rye and Smut. Cleans the dirtiest Flax. Has special knocker and skimmer which prevents clogging. (Other machines choke up.) Takes Dodder, Barn Yard Grass and Foxtail out of Alfalfa and Millet "slick as a whistle." Takes Buckhorn from Clover. Sorts Corn for Drop Planter. Famous BEAN MILL. Handles all varieties, takes out the SPLITS, Clay, Straw, etc. Handles Peas as well as any Grain or Grass Seed. Removes foul weed seed and all shrunken, cracked and sickly grains. Takes out all dirt, dust and chaff. It is also a bully chaffer. Handles 60 bushels per hour. Gas power or hand power. Easiest running mill.

You can't afford to plant common Seed and take chances on a poor crop, when I am offering to scientifically clean and grade every bushel of your Seed Grain for this spring's planting for one paltry dollar.

Send me one dollar and I will ship you, FREIGHT PAID by MYSELF, this improved 1914 Chatham Grain Grader and Cleaner, with all equipment. Clean your Seed Wheat, Oats, Flax, Barley, Peas, Beans, Corn, Grass Seed, etc. Then PLANT those fine seed. AFTER you have harvested a bumper crop, pay me the balance of my low price. Not one penny need you pay, except the $1, until next October. And by October YOUR CHATHAM WILL HAVE MORE THAN PAID ITS ENTIRE COST IN INCREASED CROPS. Then you'll have it to work FREE for you the rest of your life.

Your Dollar Returned

I only want the dollar as evidence of good faith—to protect myself from mischievous boys. If after 30 days' hard test, you don't want my "Chatham," send it back at my expense and I will return the dollar.

A "Made-to-Order" Machine

Every "Chatham" is practically a *made-to-order* machine, for I send you the exact and proper Screens, Riddles, Hurdles and Sieves to grade and clean every *Grain and Grass Seed grown in your locality*. That's the secret of my success. I would not be the leading maker of Graders and Cleaners if I had tried to make my equipment fit ten million farms. What would you think of a clothing maker whose suits were all one size? Wouldn't it be a *miracle* if he gave you a fit. Yet all makers of Graders and Cleaners, except me, send the same equipment, whether you live in Maine, Ohio or Oregon. They wouldn't do that, if they had my 41 years' experience.

Extra Screens Free

I use, all together, 81 Screens and Sieves. It usually requires 15 to 17 for the average farm. These I select from the 81. After 41 years in the business, I am pretty sure to pick the exact equipment needed on your farm. If I shouldn't, just drop me a line and I'll send your additional requirements. There will be no charge for this.

Samples Graded Free

Maybe you have some Seed Grain that you can't clean or grade or separate. Send me a sample. I will purify it and tell you how you can do it cheaply. No charge for this.

Seed Corn Sorted

My big Corn Sorting Attachment, invented 2 years ago, is a great success. Twelve thousand farmers and many leading Agricultural Colleges are using it. It is the only machine I know of which scientifically sorts seed corn for drop planters.

New Book Ready

Send me no money now—just a Postal, for the finest, most complete Book on Seed Selection I've ever written. After the Book comes, write me what size machine you want and I'll ship it, freight prepaid, on receipt of $1.00. Then clean and grade all your Seed Grain. If you write today, you get my Book by return mail. Address nearest office.

I want you to get my catalogs, first, because they are the first step in our getting better acquainted in a business way on my direct from factory to farm, one-profit, money saving plan. My catalogs are my only salesmen, and they are the best and cheapest salesmen on earth. Get your copy without fail. My line of gasoline engines, manure spreaders, cream separators and my big general line of merchandise, everything for the farm, home and family, can't be beat in quality, and my direct from factory prices are the lowest. Think of it! A regular, guaranteed, high-grade 5 H. P. engine at only $99.50 and other sizes from 1¾ to 15 H. P. at correspondingly low prices. Get my catalog giving all the facts. I will mail you a copy free, postage prepaid. Write me today. Now!

Buy on My Direct From Factory Plan and Save $50 to $300

Depending on the size you buy. Put that money right back in your pocket. That's keeping your money at home better than any other way you can think of. Take your choice of any engine in my entire line. They are all designed especially for farm work. They are easy to run, easy to operate and use less fuel than any other engines made. They are built in sizes from 1 3-4 H. P. to 15 H. P. My Light Duty and Pumping Engines 1 3-4 and 2 1-4 H. P. sell from $26.75 up and ready to put right to work when you receive them. No extras to buy. You can equip your power plant with a Galloway Stationary engine at one-half the regular cost. My portable engines are all steel, durable machines, either hand or horse portable trucks. My Horse Portables include friction clutch pulley. Galloway saw rigs are built extra strong and extra safe. They are unequalled today. Yes, sir, you won't find a more complete or better built line of farm work engines on the market. My Free Service Department will aid you in selecting your equipment and in installing your engine. This service is absolutely free to the man who buys a Galloway and it will save you a lot of money and time. Get my catalog giving all the facts.

Get My New Special Offer

Write me today for my catalog, either my big Complete Engine Book or my special Pumping Engine catalog, or both. They are FREE. When you write for my catalog I am going to make you the most liberal offer you ever heard of; an offer that will help you get your engine partly or entirely FREE to you in the end. No soliciting, no canvassing—just a straight business proposition. The most liberal co-operative, profit-sharing offer ever made. You should know all about it. Then write for my catalog, now, before you lay this paper down. Just address

William Galloway, President

William Galloway Company

The Great Galloway Line Includes Stationary, Portables and Saw Rigs—Just the Size and Style Engine You Want

Horse Portables Made In 5-6-7½ 10 and 15 H. P. Sizes

Middletown, Pa., Jan. 21, 1913.
Dear Sirs:—I will tell you that the metal ceiling that we received for our Church, we are well pleased with. Yours truly, Abram Geyer.

Lock Haven, Pa., Aug. 15, 1913.
Dear Sirs:—Your catalog is here. I think it is very nice, also your plan. Well pleased with our Lawn Fence and will send another order soon. J. T'fer.

Turkey City, Pa., Dec. 23, 1913.
Dear Sirs:—The Unito Engine which I got from you several years ago is just as good as it was the day I got it and now I am in need of some roofing, so I thought I would write you for your prices. J. F. Jones.

Shirleysburgh, Pa., Feb. 3, 1913.
Gentlemen:—Your catalog is all thru very nicely arranged and is very reasonable in prices. H. F. Reck.

Reynoldsville, Pa., March 10, 1913.
Gentlemen:—I find your Unito Incubator a first class machine and it will do all you claim for it. Yours respectfully, Mrs. J. M. Shearer.

Hatfield, Pa., July 7, 1913.
Gentlemen:—I received the roofing in good condition. I am pleased with it and the promptness with which you sent it. Yours truly S. C. Moyer.

Fredonia, Pa., June 17, 1913.
Dear Sirs:—Received the Garden Cultivator O. K. It is a very good tool and I am well pleased with it. Samuel McBurney.

Milroy, Pa., Dec. 26, 1913.
Dear Sirs:—Enclosed find check for $160 in payment of the gasoline engine bought from you on the 30 days trial offer. It has proved satisfactory and works fine. Yours truly, W. D. McNitt.

TRY Them 30 Days BEFORE YOU PAY—

I want to send you this big Free catalog—postpaid. It explains how you can buy Ready Roofing, Metal Roofing, Barn Paint, House Paint, Fencing, Cream Separators, Incubators, Garden and Farm Implements, Sprayers, Harness, Buggies, Wagons, Gasoline Engines, Furniture, Pianos, Sewing Machines, Ranges, Wallboard, Shingles, all of which are sent direct from our factories company at a big saving. You don't have to pay one penny until you have seen the goods, examined them, and are satisfied with your purchase. I will positively ship any article listed in our big factories catalog, to any responsible person anywhere in the United States.

NO C. O. D.—NO DEPOSIT—NO PAPERS TO SIGN—

Just write for the catalog—find out about our plan—order what you want, on the most favorable terms ever offered.

We combine the products of 33 big Factories who have cut the cost to save you money. In addition to letting you see the goods and try them—we guarantee every purchase.

Nothing like this offer was ever made before. You cannot lose one penny. ***You take no risk.*** There is no chance for dissatisfaction. All expense, if no sale, is shouldered by us. We don't ask you to take a single risk.

If you want dependable merchandise such as we can furnish—the savings on which will surprise you, write today for

This New Free Catalog

Ready Roofing
All wool felt—heavily coated with mineral asphalt—waterproof and leak-proof. Complete with nails and cement, only
90c Per Roll
Each Roll Covers 100 Sq. Feet
WRITE FOR SAMPLES
Give us an idea of what you want and we will send you samples FREE so you can test them before ordering.

Price Reduced on Metal Roofing
NO RUST—NO ROT—NO LEAK
Excell Galvanized Roofing is the highest grade and by all odds the best you can buy. Easy to lay, requires no tools, no experience. If you want a roof you can depend upon, what you need is a quantity of our
EXCELL METAL ROOFING
We can also furnish you with wall board, asphalt shingles and painted Metal Roofing at surprising prices. Write for FREE SAMPLES of roofing and wall board, and get our big Factories Catalog explaining our "See-the-goods-before-you-pay" plan.

PAINT BEFORE YOU PAY
Write for color cards and our Paint Book free. Find out about the new way to buy paint by mail.
UNITO PAINT is fully guaranteed—open it up and try it. Give it any fair test—if not satisfactory it's our paint—and you are not out a penny.
Barn Paint 70c Per Gallon
Others in proportion.

Both Incubator and Brooder
$9.45 30 Days' Trial
135 Egg Incubator
Incubator has hot water heat, big chick nursery, Tycos thermometer. Made of Select California Redwood covered with galvanized iron. Write for catalog and get full description.

Try the UNITO Cream Separator 30 Days
See the Cream Separator before you pay—use it 30 days. Compare the work it will do with any separator made. Our factory prices
$19.85 and up
Full description of this great labor-saving device will be found in our Factories catalog—sent free—postpaid. Fill out the coupon and mail it to us. We guarantee Unito Separators to get all the cream; easy to run and well made.

FARM TOOLS
This Unito Cultivator $2.75
at $2.75 is a big bargain. We have many others just as good. Write for catalog and find out about them.

FENCING
We quote only dependable fencing of best quality. Fully guaranteed.
13½c A ROD AND UP
Stay wires are strong, top and bottom wires extra heavy. Double galvanized—cannot rust. We can supply just the kind of fencing or gates you need. Write for the catalog.

TEST UNITO BUGGIES
$39.95 and up
Order One
See Before You Buy
Try It 30 Days
Give it all the tests we recommend. Look it over, ride in it. You will find that we can save you a lot of money. Write for the big catalog for description and prices.

$4.80 See Before You Pay
Try It 30 Days
This beautiful Oak Rocker upholstered in leatherette sent on 30 days trial to show you a sample of our furniture line. If satisfied after 30 days pay us only $4.80. Write for catalog showing complete line.

SEE THE UNITO HARNESS $10.98
Don't buy a harness till you have tried the famous Unito make. If satisfied only $10.98 for this single strap, breast collar buggy harness. It is a wonder for the money. See catalog for complete description.

Agricultural Short Course Graduates.

By Prof. A. L. CLARK,
New Jersey Experiment Station

Within the next few weeks several thousand graduates of Agricultural Short Courses will be turned out upon the farms of the country. Many of them have farms of their own, or parents or friends to go to; many must find places to work for wages in order to support themselves. Some have spent their lives at farm work, some have had a little experience while more and more each year are graduated without any practical experience. Is it not a question of much importance and a subject which all agricultural workers should earnestly consider, "What is to be their future?" "How are we farmers going to receive them?" "What is to be their influence upon our work?"

Much Depends Upon The Attitude Of The Young Man.—The farm-raised man who takes the Short Course usually has the right attitude toward the relationship between rural life and scientific agriculture. He has been trained in hard work; industry and patience are recognized by him as necessary to farm success. His presence at the Short Course proves that he realizes that without special education in the science of his profession large success is almost impossible. He recognizes the fact of his finished course as a new beginning, and that thereafter he is in a much better condition to learn the fundamental things connected with his work, and by combining the knowledge gained from experience with his newly-acquired learning, and applying himself industriously to his work, he is assured of an excellent living, and a happy and well spent life.

The young man without the advantage of this previous experience is like a ship without an anchor. He has little conception of farm work or farm life. He is too apt to over estimate the value of his education. In plain words, he is like the average young ambitious man—a little knowledge puffs him up. He believes what he does not know about his work is not of much value. We see the same thing all the while in other lines. Let us not blame these inexperienced boys too much. They mean well. They would not have undertaken to make farmers of themselves if they had not some strong purpose. It seems that tradesmen and mechanics take in apprentices. They often find the same trouble, but still these learners make the future business men and craftsmen. Can we not receive these beginners with a better spirit? Let us try to put up with their assumption; it is natural in young people. They will learn that time and experience ripens. They are ready for the ripening.

We owe it to our profession to give these ambitious young men a good start. Nothing is so necessary as to guide their attitude into friendliness with present conditions without losing their purpose of progressiveness. The city boy has that great disadvantage of being a city product when he undertakes farm work. His whole being is saturated in city habits, city pleasures, city thoughts, city ways of doing things and city ways of thinking. A readjustment is necessary before any degree of pleasure is secured or farming success can be attained. Some have natural ability to fit themselves into their environment. Others retain their acquired attitude and change comes very slowly. Much depends upon the attitude assumed by the graduate toward farming, and let us not forget that much depends upon the farmer's attitude toward him.

Snap Judgment Has Not Always Proved Correct

Many of our more progressive farmers as well as some of agricultural leaders and authorities have little faith in City Short Course graduates. Their experience has led them to hope for little from any of them. Yet in some cases first judgment has been later refuted and a few very fine [illegible] have been born anew from city boys. These graduates, who must go to work for wages, have some trying experiences to meet and it is no wonder that many of them get discouraged and give it up. Often it is their first experience of living away from home. If they are city-bred they have a decided change in environment. Are farmers in general liberal-minded enough when it comes to putting up with the, to them, queer ideas and desires which they show?

Most of these men desire experience rather than wages. Very often they are given the most simple which is also the least interesting work to do. Sometimes if they are found to be proficient in any particular line they are put to doing that kind of work entirely. Quite often, in the case of farm-bred boys, they know how to milk and about all they learn is the different cow's names and how much each one gives. They probably wanted to learn how to use the separator or the Babcock test if such things are used on the farm, or perhaps they thought they would get an opportunity to see alfalfa cured and handled or some modern machinery handled. These young men are after knowledge and broad experience. They are not content to spend as many years as the average farmer did to learn the business. They do not recognize the importance of imbibing the spirit of patience. They often misconstrue it for apathy or outright laziness.

Perhaps they disappoint the farmer in their own lack of industry. If many of us would look back in our own lives we would find a time when we had much rather take a nap under a shady tree or go swimming than finish a long row of corn or potatoes. Many farmers find it hard to secure and keep good workmen. They all believe that they treat their men much better than city employers. Possibly they do, but there is a sense of lonesomeness and isolation on the farm which many men feel acutely. Long hours are not responsible for half as much of the dissatisfaction among farm help as is this factor. To young men this is an especially strong factor. The farmer and his family must take a personal interest and make it felt among their men if they are to counteract this instinct for town sociability.

A Possible Source Of Intelligent Farm Help.—Every Short Course College in the country is turning out more young men every year. Most of these of farm experience have farms of their father's or some one else's to go to when thru. Most of those who will look toward a good, well-conducted farm to get work will be men of little or no practical experience. This condition does not prevail in the West so much as in the East. How can these young men get the experience they so much desire? Are we going to pass over them entirely simply because they can not hitch up a horse or milk a cow. Many of the foreign men that are hired every year can not even understand what we say to them, not to mention hitching a horse to a rig twice in the same way. Here then is the proposition: Can not the farmers look upon the Short Course graduates as a source of intelligent but inexperienced help? Can not these young men make satisfactory help at low wages if not too

THE FARM WORKSHOP PROVIDES EMPLOYMENT FOR STORMY DAYS AND SAVES MONEY IN REPAIR BILLS.

much is expected of them? Cannot the instructors at the colleges endeavor to impress upon their students that farming is not taught; it is learned by absorption? In this co-operation it would seem that much profit might accrue to all interested.

TREATMENT OF SEED POTATOES

The Mercer County, N. J., Farm Bureau has been holding a series of meetings lately at which the growers have been given expert advice concerning the treatment of seed potatoes. At each of these meetings, which were held at convenient local centers, Prof. G. W. Martin, assistant state plant pathologist, gave a talk. He quoted his chief, Dr. Mel T. Cook, who said that "by seed selection and by seed treatment half the losses the potato growers sustained last season could have been prevented." Dr. Cook was recently in Maine urging growers there to more careful seed methods, and that they should allow inspection of their fields during the growing season by representatives of the various potato associations.

As the simplest and most practical seed treatment, Mr. Martin recommended the soaking of the whole seed for two hours in formalin or formaldehyde solution, one pint to 30 gallons of water. This treatment, he said, would kill most of the plant diseases which affected the outside of the potato, mainly common potato scab and black leg, and would decrease the amount of scurf; altho if the latter disease was prevalent he would rather use the corrosive sublimate solution, three ounces to 30 gallons of water. He would not, however, recommend the latter solution for general treatment on account of its extremely poisonous character.

Mr. Martin plainly stated that treating the seed with formalin would not alone produce a good crop of potatoes, and it would not kill the disease germs in the soil. Nevertheless, he said that the Experiment Station believed that the time was at hand when it was necessary for all growers to treat their seed, otherwise the danger of infecting the ground with more diseases which could not be easily eradicated was too great. The cost, he stated, was small and the protection given worth much. It must not be forgotten, that the potatoes should be spread out to dry after soaking as soon as possible and they can then be directly cut for planting or stored in disinfected bins or bags.—D. T. Hendrickson, Monmouth Co., N. J.

THE FARMER'S APPEAL TO HIMSELF

The farmer generally has allowed money consideration to stand too grimly his master and guardian. When he hears of the bumper crops, the cheap land, the great chance for speculation in farms rapidly rising in value in other states his own farm comes to look tame to him. He forgets the advantages at hand, sees only the glitter of the gold to be made so easily in some distant community.

May-be he has neglected to keep the boards nailed on the fence even, the wallows filled, and the weeds cut. These things make matters look worse, and probably Mr. Farmer tramps discontentedly around them thinking all the time of how he will make things go when he gets to the land of his strong desires. The house has not been painted possibly for twenty years; possibly the barn has never been painted. Things do not look tidy, altho it would not take very long to slick the place up wonderfully.

He lives on a good pike, near a good town and school, good outlets appeal for drainage; congenial neighbors who know and appreciate him are all around. Why does he want to leave his home? He wants to leave because he has never done anything for the place to appeal to him to stay. Suppose he had begun to paint, to tile his farm, and get out of his "rut"!

We were not all made hustlers; not all for glorious successes. May-be we could do no better on some other farm in some other state than we are doing right where we are. Sometimes an awakening, a regeneration of inspiration and ideals is attended with happier results than the much desired change.—George P. Williams, Delaware Co., O.

Home Mixing of Fertilizers.

By ABRAM BUNN, Bedford Co., Pa.

Many farmers in recent years have adopted the practice of mixing their fertilizers for themselves. Many find it cheaper and more satisfactory as they are able to secure just the mixture that is needed on their farms. The following is written for the benefit of those who desire to mix fertilizers at home and who lack directions for the work.

Objections

The objections, which are urged and often effectively, against home mixing are as follows: The farmer cannot mix as thoroly as a fertilizer company which is equipped with special machinery. 2. The home mixture will not work thru the drill. 3. If there is any of the mixture left over it will cake and become worthless. The first objection is rather inconsistent so long as fertilizer concerns use the alternative formulas in their statement of analysis. How can any concern claim to mix accurately and at the same time put out such a formula as "Ammonia, 2 to 4 pct; available phosphoric acid, 8 to 10 percent; potash, 4 to 6 percent.

As a matter of fact, the farmer, with a rake and shovel can mix accurately enough for all practical purposes. In the trucking districts of New Jersey farmers have been doing it for years and analysis has shown a remarkable accuracy in the work. There they mix in considerable quantities, allowing the mixture, after raking the several materials and shoveling them over until the colors have well blended, to stand in a large pile, cutting it down for use as required. The whole process of mixing is done when the colors have blended and the streaks are gone. Trifling inaccuracies there will be; but when the stuff gets in the ground the movement of soil water will quickly distribute the materials so that the average in the ground will be excellent.

As to the second objection, I have never seen a drill that worked well with a commercial brand that would not do the same with home mixtures. The fault is not with the mixture, if there be a fault, but with the drill. The third objection is valid to a certain extent. Allowing concentrated, home-mixed stuff to stand for a long time will result in caking and trouble. But what is the use of allowing it to stand; why have any left over? If we can save money and improve crops by the use of a home mixture, why not mix for the day's needs or for a day or two ahead, and not have anything left over to cake and bother us? However, if there should be, for any reason, some of the mixed stuff left over after seeding, simply mix with it some dry sand or ash-waste and re-sack it. We have then put it away in much the same shape as the factory would furnish it. Do not, however, mix wood ashes with a fertilizer containing nitrogen or ammonia.

Cost Of Home-Mixing

The average freight rate on fertilizer to Pennsylvania points is $2.20 per ton in carloads and $3.40 per ton in less than carloads. I have used this average rate in the following tabulation. If you are in the eastern part of the state, the cost of home mixing will be slightly less; if in the western part, it will be slightly more. But remember that the figures given include the freight, so that you can check up what it ought to cost you for your fertilizer of any desired analysis. Or, to put it in another way, you can figure how much it will cost you to get any formula of actual, available plant food by simply multiplying the cost of one percent by the total percents of the commercial brand. Here is the table:

	Cost	
	Carload lots	Smaller lots
1 pct nitrogen	$3.66	$3.73
1 pct ammonia	3.00	3.07
1 pct avail. phos. acid ...	.75	.82
1 pct potash (muriate) ...	.82	.84
1 pct potash (sulphate) ...	.99	1.01

Suppose you want a mixture to analyze 2 percent ammonia, 8 percent available phosphoric acid and 4 percent potash. To determine at what figure you can supply the plant food in a ton of this brand is a simple matter:

	Carload lots	Smaller lots
2 percent ammonia (2 times cost of 1 percent) ...	$6.00	$6.14
8 percent available phos acid (8 times cost 1 pct)	6.00	6.56
4 percent potash (muriate) (4 times cost 1 percent).	3.28	3.36
Total	$15.28	$16.06

There is, of course, the additional cost or labor of home mixing. This is offset as follows: In every commercial brand there is used a make-weight of inert material either added for the purpose or secured thru the use of low grade goods to bring the total weight up to the ton weight sold. Assuming that a ready-mixed brand contains the same high-grade material as we use in home-mixing, it is easy to find out how much this make-weight amounts to. The following table will enable you to do that with any formula, viz: For 1 percent ammonia allow a weight, of 105 lbs; for 1 pct. nitrogen allow 130 pounds; For 1 percent available phosphoric acid allow 125 pounds; For 1 pct. actual potash allow 40 lbs. The formula under discussion would thus be composed of the following quantities of fertilizer material, to make up its lowest guaranteed percentage viz: 2 percent ammonia (105 pounds by 2) 210 pounds; 8 percent available phosphoric acid (125 pounds by 8) 1,000 pounds; 4 percent actual potash (40 pounds by 4) 160 pounds; Total weight of fertilizer materials, 1,370 pounds. Therefore the filler needed to make up one ton of 2,000 pounds would be 630 pounds.

The labor of home mixing is not great. A good man will mix the equivalent of from 4 to 5 tons in a day on the barn floor. In ready mixed goods you must haul from the railroad a third again as much weight and must handle it on and off the wagon. So we offset the labor of home mixing against the labor of hauling and handling this excess weight.

Home Mixing For Large Farm

We use the ton of 16 percent acid phosphate as the basis of all home mix ing calculations, and stick to the dec mal system because that makes it eas er to handle. The following is a state ment of proportions used in the "To Sack Method":

1 sack nitrate of soda makes 1 per cent nitrogen, or 1.2 percent ammonia.

1 ton 16 percent acid phosphate makes 10 percent phosphoric aci (available).

1 sack potash salts makes 3.15 per cent potash (actual).

Rule 1. If you want a larger or smal er proportion of nitrogen or potas increase or decrease the number o sacks (or parts of sacks) of nitrat or potash salts accordingly, but do no change the base of 1 ton of phosphate Thus: Adding ½ sack of nitrate o soda would increase the proportion o nitrogen from 1 percent to 1½ percen using 2 sacks of muriate instead of on would make the proportion of potas 6.3 percent instead of 3.15 percent.

Rule 2. If you want to raise or lowe the proportion of phosphoric acid from the 10 percent base, add to or sub tract from the sacks of acid pho phate, but do not change the quantitie of nitrate or potash salts. Thus: I we want 8 percent phosphoric acid in stead of 10 percent, we would use only 8-10 of the sacks in the ton of aci phosphate. In a ton of 16 percen phosphate there is just as much actu phosphoric acid as there would be in 1. tons of ready-mixed fertilizer contain ing 10 percent phosphoric acid, that i in 3,200 pounds. By the "Ton-Sac method," therefore, we always figur that the total quantity of home mixtur is equivalent to 3,200 pounds of a com mercial brand of the same formul which gives us:

Rule 3. Add together the actu weights of fertilizer materials mix by the ton-sack method, figure that th total weight replaces 3,200 pounds com mercial fertilizer, and cut down th application for the field accordingly These three rules are fixed, do not var and cover the entire matter of hom mixing by the ton sack method. Th following example will illustrate th application:

Example.—Suppose we want to re place the formula heretofore discusse 2 percent ammonia, 8 percent pho phoric acid and 4 percent potash, w would use, by the ton-sack method, th following quantities: 1 sack of nitrat furnishes 1.2 percent ammonia; 2 sack nitrate furnishes 0.8 percent am monia. Total ammonia, 2 percen One ton of 16 percent phosphate fu nishes 10 pct. phosphoric acid. As w want but 8 percent, however, we us (as per Rule 2) 8-10 of a ton to furnis 8 percent phosphoric acid. 1 sack muriate of potash furnishes 3.15 per cent potash; ¼ sack (strong) furnishe 0.85 percent potash; total potash 4 per cent. The weights of materials actually used (see Rule 3) are as follows: 1 2 sacks of nitrate (200 pounds each) 33 pounds; 8-10 ton of acid phosphate 1,600 pounds; 1¼ sacks muriate at 2 pounds each, 250 pounds, making total of 2,183 pounds. This 2,1 pounds (Rule 3) is equivalent to 3,2 pounds of a commercial brand 2-8-4 We should use, therefore, just abo two-thirds as much of the home mixtur as of the commercial brand.

How Home Mixing Is Done

Empty a sack of phosphate on th barn floor; weigh out the quantitie of muriate and nitrate to go with i Dump them on the heap, and shovel an rake over a few times until color blend. The work is then well done an the mixture is ready to use. It wil save time and bother if you have a couple of buckets, and, when you have weighed out the quantity of nitrate and of muriate to be used with a sack of phosphate, make a chalk mark inside the proper bucket and next time fil

SPRAYERS Are a Necessity and a Benefit.
They save your crop, increase the yield and improve the quality. Our Spray Calendar shows when to spray and what materials to use. Our "Spray" booklet shows 70 combinations of
IRON AGE
Bucket, Barrel, Power and Traction Sprayers for orchard and field crops and other uses. Built complete or in units—buy just what you need. Ask your dealer to show them and let Uncle Sam bring you the rest of the story and the spray calendar. Also "Iron Age Farm and Garden News" free.

up to that mark. If you have any material left over after seeding, mix with it a little dry sand, dirt or coal ash waste.

Home Mixing For The Small Farm

For the small farm, home mixing is extremely simple and easy. When you go to the field to do the seeding take, in addition to the half-bushel measure, a four-quart pail, a shovel, and, if you have one, a peck measure. This system is based on the known percentage of plant food in nitrate of soda, potash salts and 16 percent phosphate, and on weights of the material as follows: 1 sack of 16 percent phosphate weighs 167 pounds; 1 bushel muriate or sulphate of potash weighs 100 pounds; 1 bushel nitrate of soda weighs 83 pounds.

After you get into the field clear a space in the back end of the wagon box, empty a sack of phosphate there, pour upon this pile the quantities of nitrate and potash salts to go with that sack and shovel the pile over until the colors blend. Then you have a perfectly well-made mixture, ready for drilling. Here are the proportions for field mixing: A sack of 16 percent phosphate furnishes 10 percent phosphoric acid; A heaped four-quart pail nitrate furnishes 1 percent ammonia; 1½ level 4-quart pails nitrate furnish 1 percent nitrogen; a scant 4-qt. pail muriate furnishes 2 percent potash; A level peck muriate furnishes 4 2-3 percent potash.

MISS ALEEN FELL, MERCER CO., PA.
Prize Winner at State College Corn Show.

Example.—Suppose we want, by this method, to replace the formula we have heretofore considered, containing 2 percent ammonia, 8 percent phosphoric acid and 4 percent potash. We would use two heaped 4-quart pails of nitrate for 2 percent ammonia; two scant 4-quart pails muriate for 4 percent potash. The sack of acid phosphate would furnish (as above stated) 10 percent phosphoric acid; but, as we only want 8 percent for this mixture, we use 8-10 sack for 8 percent phosphoric acid. The 167 pound sack of 16 percent phosphate contains 1.6 as much actual available acid as a 167-pound sack of commercial brand guaranteed to carry 10 percent phosphoric acid. The home mixture, therefore, is equivalent to (1.6 times 167 pounds) 267 pounds of the commercial brand.

Add together the weights of the materials used in making the "One-Sack-Mixture", and this total weight is exactly equivalent to 267 pounds of a similar commercial brand. Thus, in the case just considered we have used 8 quarts nitrate weighing (¼ of 83 pounds) 21 pounds; 2 scant 4-quart pails of muriate, weighing say 23 pounds; 8-10 of one 167-pound sack of phosphate, 134 pounds, making a total of 178 pounds. This 178 pounds is equivalent, as stated, to 267 pounds of commercial 2-8-4, and the application can be cut down accordingly to about two-thirds as much as would be used of the commercial brand. This wagon bed mixing is quick, effective and certain. As soon as colors have blended the mixture is ready for and will work thru the drill; and, as you are mixing a sack at a time, you are not going to have any left over to bother with.

QUEEN OF PENNSYLVANIA CORN GROWERS

The accompanying illustration shows Miss Aleen Fell, of Mercer County, Pa., who was awarded a special prize in State College corn-growing contest for 1913, for the second best 10 ears of corn produced anywhere in the state. She raised almost 98 bushels of shelled corn from her acre of land and defeated 80 boys in the Mercer County contest. She is but eleven years old and was the youngest participant in the state contest. As a result of her work she was given the title of "Queen of Pennsylvania Corn Growers" at the recent Farmers' Week at State College.

CAN A POOR YOUNG MAN SUCCEED?

I write this simply to encourage other young men. I started farming for myself and wife three years ago this coming April. In starting I purchased an 86-acre, run-down farm that had been rented for five years and cropped four years. The purchase price was $7,600. I had $600 to pay on the purchase price and gave a mortgage of $7,000 at 5 percent. Besides the $600 I had enough money to buy two cheap farm horses, what little machinery I was compelled to have to farm with, and one cow.

The first year we merely made a living and cleared expenses. The farm was run out of grass and that cut the hay crop short; only getting a little over eleven tons. The second year the hay crop was still out of the rotation, but I made a little over expenses. In December of 1912 my house burned down with a little over half enough insurance to cover loss. We rebuilt the the following summer.

In the summer of 1913 I started a dairy, buying common cows, five in June and July and three in October and November, borrowing money to pay for them. I started then to ship milk to Philadelphia at 4½ cents per quart. Having fairly good pasture on my mowing fields after harvest, I turned the cows in. I bought mill feed for the cows for six days and found that the feed would eat up too much of the milk money. So I gave the cows only their living in pasture until November. After that I kept them in the stable and fed new corn, and later, oil meal. Up to January 1st, I fed 2,000 lbs. to nine cows, the cake meal being the only feed bought.

With the nine cows all in different stages of profit, from June 21st until January 1st that made a total of 11,148 quarts which brought, less freight, $603.01. Seven calves sold brought $119.50. The first cost on 8 cows was $515. Among other sales were 32 tons of hay, $153; 13 hogs, raised and fed on farm, $207; smaller sales, $277. By these transactions of 1913 I have paid for the eight cows and have paid $1,115 on the new house, which with the insurance, clears a new stone dwelling. I have had other sales to cover run-

John Deere Two Way Plow
The Sulky with the Steel Frame and Patent Auto Foot Frame Shift.
A Few Strong Features
1 All Steel and Malleable Frame—Steel Arch: Strong—Light—Durable, Alignments Permanent.
2 Patent Auto Foot Frame Shift: Perfect Control—accurate width of cut.
3 Long Malleable Beam Clamps: Beams held rigid—uniform cut.
4 Automatic Shifting Hitch: Clevis always in position. Correct line of draft.
5 Automatic Horse Lift: Pull of team raises bottoms.
6 Adjustable Jointers: Clamped to beam. Every adjustment.
7 Wide Tread: No tipping on hillsides.
8 Chilled, Full Steel and Combination Bottoms: Every style for Eastern conditions.
9 Removable Shin Piece: Keen cutting edge—easily renewed.

ning expenses of the house and farm.

There is more profit in the farming done by the man who steers the wheel. The only help hired is a boy fourteen years of age with little experience in farming. Our motto is "necessities first, luxuries after; and in the meantime consciousness of dependence on God." Anyone who leaves out the consciousness of dependence upon the bounties of God leaves out the most important part of true success.—J. F. Johnson, Bucks Co., Pa.

Farm Crop Notes

By
R. P. KESTER
Counselor on Soils to the State Department of Agriculture.

Thru this department Mr. Kester will discuss queries from Pennsylvania Farmer readers on soils, field crops and general farm practice. Address all queries to Pennsylvania Farmer, Philadelphia, Pa.

Farm Comments

In spite of all that has been said and done, and with frequent object lessons in better things, one notices in almost every community the all-too-common neglect, on many farms, to do the following three things: To take proper care of the manure; to give the right care to the farm orchard; and to make a persistent effort to improve the home and the home grounds. Harsh as it may seem, the only excuse that can be offered in most instances is a lack of intelligent interest and effort.

Surely, every farmer knows that he is losing money by throwing the manure out at holes in the barn, under the eaves, and leaving it there until spring to heat and leach away; or, by doing what is not much better, hauling it to the field and putting it in small piles until spring plowing.

Surely, with the scarcity of good fruit and with the present high prices, the thoughtful farmer must realize that it would pay to spend a part of the winter season in pruning the farm orchard. There is probably no more noticeable lack of good practice than is seen in the neglected orchards. Even if commercial fruit growing is considered a business for the specialist, farmers cannot afford to let the farm orchard go to ruin.

Too often we see farm homes and surroundings that, apparently, have received as little attention as the orchards. I visited an old man at his farm home some time ago and voiced my admiration of his well appointed and comfortable home. He replied: "When my wife and I came here, forty years ago, we made the resolution that we would add something to our home every year that would add to its comfort and beauty. We have kept that up, and while it is still a modest home, we are not ashamed of it." Little by little, things needful were added; trees, shrubs and flowers were planted until it is a splendid example of an ideal country home. Yet at no time did they embarrass themselves by extravagant outlay. They had an ideal, and they worked toward it. Too many defer improvements and additions to a more favorable time and gradually settle into a satisfied feeling when there is no desire for change.

Crops in Young Orchard

E. S. P., Berks Co., writes: "I have a young apple orchard, planted last year, which I wish to keep cultivated and in which I wish to raise some other crops as I cannot afford to lose the use of the land. What can I plant and what should I use as fertilizer?"

Resolve in the first place to add at least as much fertility in manure or fertilizer, or both, as the inter-crops will remove. In the second place, only such crops as can be removed by midsummer should be planted. Early potatoes and early cabbage are among the best. Early tomatoes may also be grown. After the crop is removed, say about the first of August, sow a cover crop—a legume, as crimson clover, or rye and winter vetch.

Improving Soil in Orchard

"I have an apple orchard of six acres which has been used as a pasture for pigs and calves for ten or twelve years. I have just pruned the trees and want to give them good treatment from now on. They have not borne well nor made much growth lately. What shall I do to the soil? E. N. S., Potter Co., Pa."

If you have manure, give the orchard a good coat of manure now. Apply between the rows. It is not necessary to place any within five or six feet of the trunks. Then sow about 400 pounds of acid phosphate per acre. Plow the ground next spring, being careful not to plow so deeply as to seriously injure the roots. If manure is not to be had, apply 500 or 600 pounds per acre of good complete fertilizer after plowing and harrowing. Keep the ground harrowed until mid-summer and sow a cover crop to plow down the following year. The trees evidently need cultivation and plant food. These things are supplied for the benefit of the trees, and fruitage is the result.

Run-down Buckwheat Land

E. C. T., of Crawford Co., writes that he has a piece of very badly run-down land that he wishes to restore. It has been sown to buckwheat for 20 years and there is practically nothing left. He inquires whether sweet clover would help.

Probably the first thing this land needs is lime. After such usage as is mentioned, lime would most likely be required before any legume will succeed. Sweet clover might be a good thing to sow, then let it lie 2 or 3 years in that. However, after liming, medium red clover would probably succeed fairly well, especially if a light application of manure was given. After turning this in, endeavor next to get a sod—a red sod started. Sow heavily with timothy, alsike clover and red top. Top-dress this with manure or a high grade fertilizer. Buckwheat land needs the effect of a heavy grass sod to bring the right mechanical condition. It will require time to bring this land back.

Sowing Grass in Oats

F. K., New Jersey, writes: "What are the objections to sowing timothy with oats? I had too much other work to allow me to seed last fall."

There are no objections to sowing grass seed with oats. Very many farmers practice this method. The stand of grass may not be as even or as heavy as when sown alone, especially if the oats grow large and thick on the ground.

The grass seed should be covered by a weeder or light harrow, or sown ahead of the drill hose. Use plenty of seed.

Garden Soil

G. B. S., Mercer Co., writes: "Our garden does not produce satisfactorily. It has been used a great many years but lately tomatoes, corn, etc., do not ripen."

This is a very common complaint, and is the result of a long continued uniformity of practice. Lack of rotation, exclusive use of barnyard manure, failure to grow cover-crops have unbalanced the soil. Give a heavy application of a fertilizer rich in phosphoric acid and potash. Sow a cover crop of some kind as soon as a crop is off. Grow a grass sod occasionally. Omit for a year or two the barnyard manure, using fertilizer instead.—R. P. K.

2A BROWNIE
Price, $3.00

JUST the thing you need on the farm to take pictures of stock, crops, etc.—you can use it to advantage in *your* business. It is very simple to operate and works like it's big brother the Kodak. The film cartridge of six or twelve exposures can be put in or taken out by daylight, and you can do the developing and printing yourself without a dark-room, or send it to your dealer. Takes pictures 2½ x 4¼ and you can make as many prints as you want.

Ask your dealer for catalogue or write us and we will mail it free.

Plant Breeding and Seed Saving by Farmers

By C. C. HULSART, Monmouth Co., N. J.

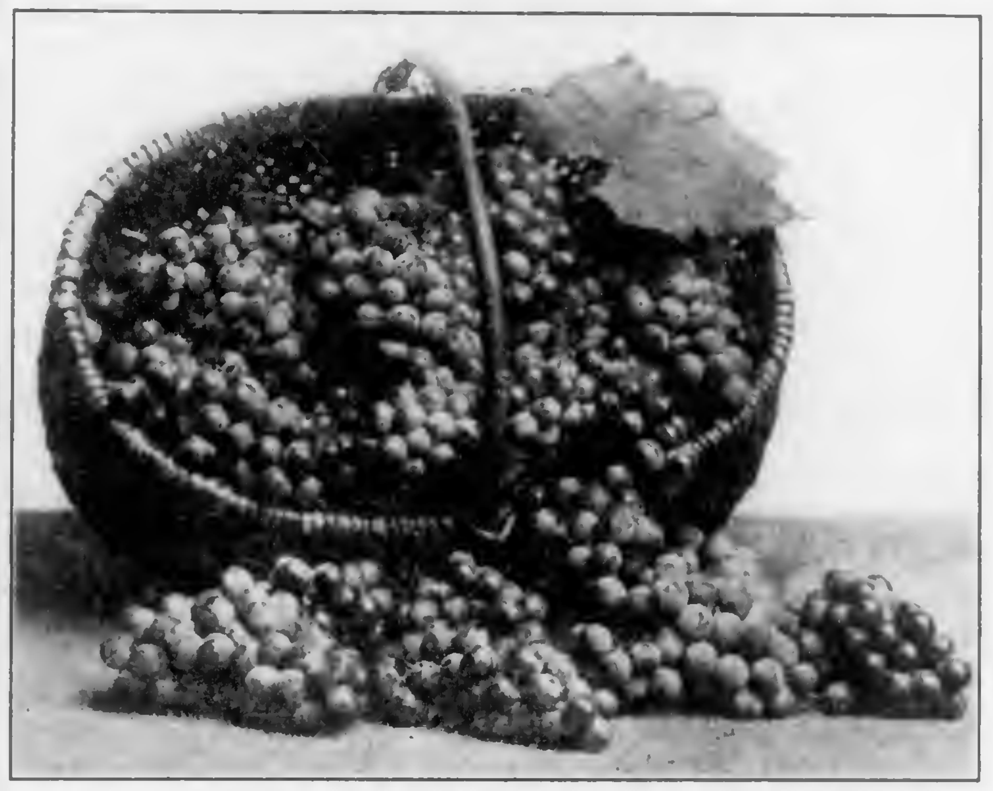
The question of seeds for the farm is an all important one. The cost of seeds is a mere bagatelle in comparison to value of crop, and yet most farmers look solely at first cost. It is a noticeable fact among purchasers of vegetable seeds, and flower seeds too, that before making the purchase they consult all the seed catalogs at hand and the one furnishing the most for the least money gets the order. Another class of purchasers is captivated by catchy pictures with descriptions painted in high colors and out of all proportions to this peculiarity. I do not wish to be understood as condemning all seed houses. Many of our commercial seedsmen have done very good work, and many valuable varieties of fruit and vegetables are in existence today solely thru the efforts of these men. But when any variety ceases to be a novelty and becomes what is commonly termed bulk seeds, interest in that particular variety or strain apparently ceases. In other words, when the plant breeder leaves it and the annual supply of seed is grown by contract, then the trouble begins.

What is the result of this? Selection stops and the strain or variety begins at once to drift back. Only by constant care and selection can type be maintained. To continue this constantly means expense, and expense in production means higher prices for the product. As competition is keen and as the seed dealers know that there is a greater demand for a cheap article, the cheap article is furnished. Aside from the honest and legitimate seedsman, there has appeared also the seed "sharp," a man without conscience or reputation, who goes about the country seeking whom he may devour. One such individual who had been operating in this state recently is now in jail awaiting trial. He could never have sold an order had the farmers been alive to the value of quality as well as price in seeds.

I was talking on this subject at a farmers' institute in this state some years ago when a man asked me what I thought about using cabbage stalks that had had the heads removed and marketed for growing seed. He said he had been asked to sell a quantity on his farm to a party who wanted them for that purpose. My answer I will discuss later. For years I have seen tomato seeds out drying by the hundreds of pounds at a canning house. This seed found its way to the farmers to grow future crops. But is it not all tomato seed? Yes! But the purchaser of that seed received any or all varieties grown in that neighborhood and delivered to that canning house. This condition has all been brought about thru lack of knowledge and indifference among purchasers.

Now the advice is heralded thru various mediums to the farmer to purchase his supply of seeds early and have them tested for percentage of germination. That is good so far as it goes, but often the poorer-bred seeds will give the highest percentage. Weeds sprout 100 percent apparently, but where is the value? What the farmer wants and should have is seeds grown from stock that has constitutional vigor; that has the accumulation of its race behind it for generations. The stock breeder would not think of trying to build up his herd by breeding from any and every mongrel. But that is just what farmers are doing all over our land with the crops they grow. There is no one leak on the farm that is costing more than this indifference to our seed supply. If farmers would pay more attention to this and demand well-bred seeds or breed such seeds for themselves, an increase of crop would be seen out of all proportion to cost of the work.

Some few years ago the writer obtained seeds of a certain strain of tomato from a commercial seed house. The variety was of their own introduction. I sowed the seeds, raised a crop and made my own selection of seeds for the following crop. I then sent to the same house the following spring for another supply of their own growing, of the same strain and variety. This was to test their seeds alongside of mine. This was done in my greenhouse, both samples of seed being sown side by side and on the same day. Both lots grew but the plants from my own seed were double the size of those purchased when both were five weeks old. How do I explain this? Simply by selection. The seeds I saved myself were from the strongest and most vigorous plants in the field. What those that I purchased were from I do not



THE RESULT SECURED FROM PROPER SOIL AND CAREFUL METHODS IN CULTIVATION AND PRUNING.

E. Frank Coe Fertilizers

1857-1914
The Business Farmers' Standard for Over Fifty-Five Years

Do you raise 300 bushels of Potatoes per acre?

THREE hundred bushels per acre is not an unusual yield by any means, but did you get it this year?

If you were planning to raise 300 bushels of potatoes to the acre how far apart would you space your rows? How far apart would you drop the seed pieces in the row?

How much fertilizer would you use to grow 300 bushels of potatoes per acre? How would you apply it?

Are you sure that your seed potatoes are true to name and true to type?

What are you doing to prevent "scab" and early and late blight?

Did you have a short crop of potatoes because of dry weather? Have you decided how you will overcome this trouble in the future?

All these practical points, and many more, are fully covered in our new book

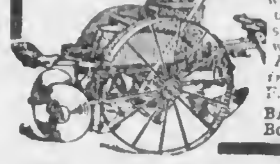
"Potatoes: A Money Crop"

which will be sent free to every potato grower who requests a copy, and mentions this weekly.

This book is written by a man who himself has had years of experience as a potato grower, and who has made a careful study of the best methods of other growers.

If you read this book you will keep it for future reference. It is a "worth while" publication.

The Coe-Mortimer Company
51 Chambers St. New York City



Potato Profits

depend largely on how the crop is planted. Every skipped hill is a loss in time, fertilizer and soil. Every double wastes valuable seed. It means $5 to $50 per acre extra profit if all hills are planted, one piece in each. That is why

IRON AGE 100 Per Cent Planters

often pay for themselves in one season on small acreage. They also plant straight, at right depth, 12 to 24 inches apart. New angle steel frame and steel seed hopper. know. There was also a pronounced difference in the size of those seeds. That is another reason why the plants that grew from the seeds selected by myself were larger at five weeks of age than were those from seeds purchased.

There is another thought, right here that I wish to draw attention to. When nature starts her work she provides for an abundance of seedlings. Thousands start to grow where only dozens reach maturity. It is a case of the survival of the fittest. But when man plants he tries to make all plants come to maturity. Hence, it is important that only such seeds be selected for future crop production that will not only yield a full measure of crop but at the same time be of strong constitution, full of vigor and true to type, fully able to produce just what the grower desires. This can readily be accomplished by the farmer himself if he will give the subject a little thought and careful attention.

Too many farmers, I am sorry to say, are working along the line of least resistance. They continue in the same old rut that father and grandfather made for them a century or more ago. This is a more progressive age; agriculture is an art and a science, and he who solves the most of these problems and applies them will the sooner realize that head work counts for more in the long run than all hand work. Success demands that we use the gray matter that a wise Creator provided us with. In a later article I will attempt to show what has been accomplished and what can be, by breeding from selection.

(Continued in next week's issue)

PRESERVING THE PEACH TREES

One of the most unwise things any farmer can be guilty of is to allow fine peach and apple orchards to decay and become unproductive. In many eastern states apple trees grow and bear abundant crops of fine fruits for fifty years or longer, but in some of the western and southwestern states the trees bear heavily from about the fifth to the twelfth years, after which the fruit becomes smaller every year, and the trees are allowed to die gradually. This generally means that the properties in the soil which gave luxuriance to the trees and sweetness and color to the fruit become exhausted, and as these properties are not fed back to the soil in the form of commercial fertilizer there is nothing to nurture the trees, and they die a lingering death. What really happens is that they starve.

When I was a small boy my father bought a tract of sandy, timber land in a western state, and opened up a farm, and as soon as he got enough land clear of stumps he put five acres in fine peach trees. These trees commenced bearing plentifully when about four years old, and continued to bear heavily until they were about eight years old, and never since then have I seen such loads of fine peaches as we had at first.

When the orchard was about eight years old the trees began dying rapidly, and within two or three years the greater number of them were dead. The others bore decreasing crops of fruit for a while longer but thirteen or fourteen years after the trees were planted, practically all of them were dead. They had been planted only about fifteen feet apart, which was entirely too close, and this was one reason they exhausted the fertility in the soil so quickly and died so rapidly. They grew luxuriantly, until they had exhausted the fertility in the soil from which they fed, when they died by the hundreds.

We had planted the orchard merely for our own domestic use, so didn't make a study of the soil to see what elements were being exhausted, and then to supply them, as we were in debt for the farm, and therefore giving our attention to crops which yielded the best profit; but we sadly missed our fine peach orchard when the trees were all either dead or almost barren.

This first experience with peaches was made when I was a small boy, but I can easily look back and see that we used very poor judgment in the way we treated our trees and the ground on which they stood. In the first place we allowed them to bear full crops of fruit while they were young and the limbs weak and slender, and this retarded their growth and made the trees low and squatty, the low limbs drooping over towards the ground, so that we couldnot get into the orchard with a horse and plow to cultivate it. The result was that the ground became hard baked, and the orchard grew up in tall weeds which helped to exhaust rapidly the fertility in the soil, and also the moisture, during dry summers.

Whether your orchard is a small one for domestic use, or a large one for supplying the distant market, it should be pruned severely while the trees are young. All the low limbs especially should be cut off; the limbs which show a disposition to bend over towards the ground. This will give the tree a straight, upward growth. Also a good many small limbs should be cut out within the crown of the tree, so as to give a thin, open appearance; when the young trees first begin to bear it calls for a good deal of courage and decision, I know, to cut off a considerable portion of the fruit while young and green; but this is the only thing to do, if fine sturdy, straight and tall trees with no drooping limbs are desired. With such trees one can readily use a plow or a one-horse harrow, in the case of young trees, for cultivation purposes. The very worst treatment for young trees is to allow them to bear heavy crops of fruit at four and five years old. Not only is their vitality sapped by allowing all the fruit to stay on the trees, but the limbs acquire a low drooping form, under the weight of these excessive loads of fruit, which absolutely prevents getting near enough to them to stir the soil. As the trees grow older all low limbs which show a tendency to bend back towards the ground should be cut off unmercifully, no matter if it means getting rid of more than half the crown. If the pruning be done in the late autumn, and the cut places painted over, no serious injury will result, but be careful about pruning too severely in the spring. Especially should cutting off too many large limbs be avoided at this time.

At the present day, with good markets, intensive farming and co-operative selling, a farmer is very unwise, not to say foolish, who allows a fine orchard to fall into ruin in a state or section where the soil shows this early impoverishment. If he does not understand what elements should be given back to the soil to replenish the waste he should get in touch with a government experiment station, or a state agricultural college, or else he should get bulletins from the United State Department of Agriculture, and learn how to save the lives of his trees. By so doing he will add materially to his bank account and greatly increase the enjoyment and luxuries of the farm home for himself and family.

No good reason exists why a peach or apple orchard should not be as long-lived in the west as in New York State or New England, and it will be if the farmer brings to the preservation of his trees ordinary judgment and good sense.—I. H. Motes, St. Louis, Mo.

Don't Feed the **Soil — Feed the Plant**

In the top eight inches of average soil there is enough plant food in the form of nitrogen to last for 90 years, in phosphoric acid for 500 years and in potash for 1000 years.

And yet that very spot may prove barren. Plants have to take up their food in solution, in the "sap of the soil." All this food may be locked up so tightly by nature that the plants can't get at it fast enough for the commercial farmer, and he has to put in the same food in the soluble form of fertilizer.

Just so, a fertilizer may, by analysis, have all the necestary elements and yet not give the plant full value because these elements are not ready soluble.

Put into your ground a fertilizer that will feed not your already overstocked soil but your hungry *crops* with food which is available and easily absorbed.

Bowker's Fertilizers

have chemically correct elements—there is a brand to fit every need. More than that, these chemicals are blended and mixed so that they are rendered water-soluble and go into your ground in the most available form. Most crops do most of their feeding in 60 days.

Write for our illustrated catalogue, based on forty years of experience. In writing, state what your crops are.

BOWKER FERTILIZER COMPANY
43 Chatham Street, Boston, Mass.

Raise more hay

for feed or for sale. That will not hurt your land, provided you supplement the manure with a fertilizer containing enough available

POTASH

Applications of 50 to 100 pounds of Muriate of Potash per acre should be made every spring. Even that does not supply over half the Potash taken off in a two-ton yield of hay.

Write us for prices. We sell any amount from a 200-pound bag up. Let us send you free book of fertilizer formulas and directions.

Planet Jr.

No. 25 Planet Jr Combined Hill and Drill Seeder and Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has steel frame, and complete seeding and cultivating attachments. The hoes run close to row without danger to leaves or roots. Two acres a day can be easily worked with this tool.

You need these scientific soil-tillers to save time, lighten labor and get bigger crops from your farm and garden. Planet Jr tools are backed by more than 40 years' experience. They range from $2 to $100, and are fully guaranteed.

FREE Our new 72-page illustrated catalogue of 60 of the latest tools, for *all* cultivation. Write postal *today*.

S L ALLEN & CO
Box 1202E Philadelphia

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

This is a practical every day time-, labor-, and money-saver. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel-cultivator, and a rapid and efficient wheel garden plow. Sows all garden seeds in drills, or in hills 4, 6, 8, 12 or 24 inches apart.

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. It is light, handy, and adapted to use by man, woman, or child. Has leaf guard for close work, and a durable *steel* frame. A most useful tool in the family garden that makes the work really a spare-moment pastime.

No. 8 Planet Jr Horse Hoe and Cultivator

The best-known cultivating implement made. It is so strongly built that it withstands incredible strain, yet it is light and easy to handle. Has new steel wheel—will not clog with stones or trash. Cultivates to any depth and adjusts to any width. Opens and closes furrow, and hoes right up to plants without danger of injuring them.

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. It has steel frame. The plow opens furrows for manure, seed, etc. and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.

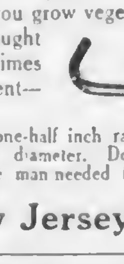
Tells all about spraying and Deming Spray Pumps. Write for name of your nearest "Deming Dealer."

The Deming Co., 315 Depot Street, Salem, Ohio

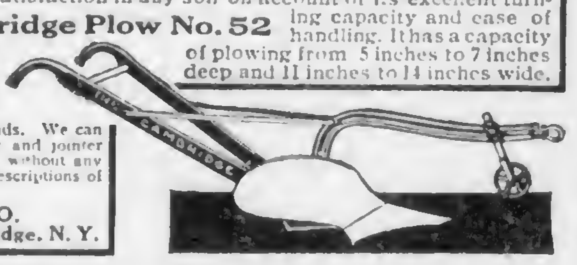


"No Need To Depend Upon Rain"
COST OF IRRIGATION NO LONGER PROHIBITIVE

The Campbell System and modern methods place irrigation within the means of every farmer. If you grow crops whose failure means vital loss to you would you spend $20 per acre per year to irrigate and insure them? Fertilizer costs that much. If you grow vegetables depending on re-setting young plants can you afford to lose them by drought when irrigation will prevent? Practice has shown irrigation to produce three times as much per acre as adjoining unirrigated land. Irrigation is not an experiment—progressive plant growers do not expect to succeed without it.

A rotating nozzle operating on 25 lbs. pressure, covering soil evenly with fine drops; equals one-half inch rain in 2 hours. First cost and operation less than other systems. One nozzle covers circle 47 feet in diameter. Does not clog with fine sediment. No posts. All piping underground except uprights. Only one man needed for operation. (*Special nozzles for greenhouses.*) For information and demonstration address

E. C. WORREL CO., Moorestown, New Jersey.



Use this Plow in Rough or Stony Land

69 YEARS EXPERIENCE BACK OF THEM

Our "Little Giant" plow shown below is built especially for use in rough land but gives perfect satisfaction in any soil on account of its excellent turning capacity and ease of handling. It has a capacity of plowing from 5 inches to 7 inches deep and 11 inches to 14 inches wide.

The New Cambridge Plow No. 52

Has soft center steel mouldboard carefully hardened and well polished; a chilled landslide and share; removable chilled iron shin plate; open-hearth steel beam with good clearance; handles of well seasoned white oak well braced. Weight of plow with clevis, 98 pounds. We can furnish either plain or cutter shares, wheel, coulter and jointer as desired. It will do excellent work, however, without any attachments. Write for free catalog giving full descriptions of complete line of the famous Cambridge Plows.

CAMBRIDGE STEEL PLOW CO.

DE LAVAL
Cream Separator
the most important machine used on the farm

SOME BUYERS OF CREAM separators do not stop to think why their purchase of the best cream separator is of greater importance than the purchase of any other implement or machine of any kind used on the farm, or for that matter anywhere else.

NEARLY EVERY PIECE OF farm machinery is only used a few weeks during the year, if that long, and when it is used simply saves time or labor over some other way, with comparatively little difference between makes of such machines except in design or size or possibly that one is better made than another and so lasts longer and probably costs more proportionately.

THE FACTS ARE VERY DIFFERENT in the case of the cream separator, which is used twice a day every day in the year, and very different as between the De Laval and other cream separators because the use of any other separator or creaming system involves not only the saving in time and labor a De Laval machine would effect but an actual waste in quantity and quality of product a De Laval machine would save.

The Cream Separator the most wasteful or most profitable

THIS IS THE VERY GREAT difference that makes the cream separator the most important of farm machines, the most wasteful or the most profitable, because used so often and involving a waste or a saving every time it is used. This is the reason why there are more De Laval separators in use than any other kind of farm or dairy machines the world over, and more than all the other makes of cream separators combined.

NO MATTER WHETHER you have yet to buy a separator or are using an inferior machine, you must be interested in what a De Laval—not a 10, 20 or 30 year old one, but a De Laval machine today—would do for you, and that every De Laval local agent will be glad to make plain to you by the demonstration of a machine itself.

IF YOU DON'T KNOW THE nearest De Laval agent, simply write the nearest main office as below.

The Dairy

OTHER CROPS THAN CORN AS ENSILAGE

Until within the past year it was my belief that the alfalfa plant could not be put in the silo and successfully made into ensilage. I had seen corn and alfalfa tried as a mixture but they were hard to get distributed evenly, hence when the ensilage came out of the silo the alfalfa which had not been thoroly mixed with the corn came out moldy and spoiled. Last fall I went up into Bradford County and there spent some time with one of the many successful farmers of that county who has tried out experiments with ensilage by putting other crops than corn into the silo.

Many farmers in this state who are growing alfalfa have found trouble in getting it cured. Especially is this true of the first and last cuttings. This farmer has solved the curing problem by putting the alfalfa by itself into the silo. The alfalfa is cut at the regular time of cutting and just as soon as he can get to it the alfalfa is put in the silo; being cut into short lengths in the same ensilage cutter he uses for corn. On account of the alfalfa tending to go thru in bunches, he uses an elevator instead of a blower to get it into the silo. It is levelled and tramped in the same manner that corn silage is. On account of shortage of pasture this man uses soiling and ensilage largely to feed his cows in summer.

The alfalfa silage comes out as sweet and free of mold as any corn silage I have seen, and the cows find it just as palatable. On account of its high food value it lessens this man's grain bill considerably. This use of alfalfa does not seem to be new, for since visiting this farmer I read in one of the western dairy papers of a man in California who owns 100 Jerseys and raises a large amount of alfalfa which he puts into the silo instead of making it into hay.

This same Bradford farmer has ensiloed other crops. One season when he expected to be short of ensilage, he had several acres of wheat which did not look as if it would give much of a grain yield. So he thought he would try putting it into the silo. As soon as the grain reached the dough stage he cut it and hauled it directly to the silo, running it thru the cutter and elevating it in the same manner he does his corn. It made good sweet ensilage which the cows found palatable and on which they yielded a good flow of milk. He had tried rye in the same manner but the ensilage was not as good and it caused the cows to shrink in their flow of milk. Still another crop used successfully to make ensilage of was oats and cowpeas, grown in the same manner and cut at the same time he cuts it for hay. He allows part of the crop to mature and has it threshed for his own seed.

This farmer has never tried planting soy beans with the corn that he puts in the silo, but this practice is followed extensively in some of the middle western states. This system gives a greater yield of ensilage to the acre and ensilage higher in protein than the ordinary corn silage. Tests by the Illinois Experiment Station showed that where corn was grown with the soy beans, the corn plant itself had a higher percent of protein than where grown by itself. The experience of this farmer ought to be valuable to other farmers of Pennsylvania who are having trouble in getting their alfalfa cured or who expect to run short on corn for an ensilage crop and have some other crop that could be suitably made into ensilage.—H., Bradford Co., Pa.

The Automobile King
HENRY FORD

Employer of 17,000 men, is the *greatest mechanical expert* and *factory manager* the world has ever seen

He knows material and construction from A to Z.

He knows a good thing when he sees it, in separators as well as automobiles, having studied farming intensely as well as mechanics.

Mr. Ford owns **three dairy farms.** On each of these three farms he uses a

UNITED STATES
CREAM SEPARATOR

Mr. Ford is not an exception in his selection of a cream separator, for most of the other captains of the automobile industry use the **United States Cream Separator** and will have no other. Among them are:

H. M. Leland, *Cadillac* **W. E. Flanders,** *Maxwell*
H. B. Joy, *Packard* **G. C. Hupp,** *Hupp*

Don't you think you can well afford to have a **United States Cream Separator,** which holds the **world's record for closest skimming in fifty** consecutive runs lasting thirty days, with milk from **ten** different breeds?

LISTEN! Read This Twice

For five months starting February first I am going to make my New Special Proposition to every dairyman in this country on the New Genuine Galloway Sanitary Cream Separator. It's a combination offer. Its equal has never been made in the history of this country. I not only save you dealer's, jobber's and catalog house profits but I sell you a better machine and give you a bonus as well to try it, which shows my faith in my separator, my proposition and my plan. No such offer as I make on the class of separator I sell has ever been made.

The New Galloway Sanitary Cream Separator is made so good in my factory that I will send it anywhere in the United States without an expert to any inexperienced user for a ninety day free trial to test against any make or kind that even sells for twice as much and will let the user be judge, because it's the most modern—the most sanitary—the most scientific—the cleanest skimmer—the most beautiful in design of any cream separator made today and I have seen them all. Write me and I will tell you how to make money in the dairy business when the pastures are dried up in summer. I did it on my own farm and know. Get my proposition now. It's so good that no dairyman who owns two or a hundred cows can afford to be without it. All I ask you to do is to first get my proposition before you decide to purchase any cream separator of any make, kind or at any price. Just drop me a postal. Address

Travel 20,000 miles, look over every factory in the United States and all of the foreign countries—you won't find its superior at any price.

Made in our own factory from finest materials on best automatic machinery, by skilled workmen, in tremendous quantities, all parts alike, interchangeable, and standard and sold to you for less money than dealers and jobbers can buy machines not as good in carload lots for spot cash.

International Special Dairy Feed

A REENFORCING FEED
A WONDERFUL MILK PRODUCER
SAVES MONEY ON YOUR FEED BILL

INTERNATIONAL SPECIAL DAIRY FEED is a reenforcing feed composed of cotton seed meal, molasses, ground grains, and grain products. Contains far more energy than ordinary mill feeds. It is the best feed you can buy for feeding with ensilage, or home grown grains. Also used extensively as an entire grain ration.

Use International Special Dairy Feed and you will save money on your feed bill and largely increase your milk production.

International Special Dairy Feed can always be used to advantage in any mixed ration that you are feeding.

Ask your dealer for International Special Dairy Feed. If he don't keep it for sale, then send us your dealer's name and address—we will arrange with him to supply you. (C-2)

Read what the owner of Sophie 19th Champion Jersey Cow of the World says.

Hood Farm, Lowell, Mass.
January 22nd, 1914.

The Quaker Oats Co., Chicago, Ill.

Gentlemen: — It will probably interest you to know that we have been feeding **Schumacher Stock Feed** to Sophie 19th, of Hood Farm, 189748. She finished her last record January 20, 1914, which makes her the Champion Jersey Cow of the world, and stamps her the greatest dairy cow living or dead. We consider **Schumacher Stock Feed** a splendid feed for dairy cows, and a strong factor in increasing the milk and butter production.

Very truly yours,
Hood Farm, per J. E. Dodge, Mgr.

Sophie 19th
Champion Jersey Cow of the World

Sensational Record of Sophie 19th
For the year ending January 20, 1914.

Milk	17,557 lbs.—12 ozs.
Butter	1,175 lbs.— 7 ozs.
Butter Fat	995 lbs.—12 ozs.

Total Record For FIVE YEARS

Milk	64,253 lbs.— 2 ozs.
Butter	3,761 lbs.—12 ozs.
Butter Fat	4,424 lbs.—13 ozs.

Valdessa Scott 2nd
The First 40 lb. Cow in the World
In 30 days' test she produced 2983.9 lbs. of milk and 165 1-2 lbs. of butter. Her one day record is 108.6 lbs of milk and lbs. of butter. One week record (7 days) 696.1 lbs. of milk and 41.675 lbs. butter. Milk test 4.70 per cent butter fat.

Colantha 4th's Johanna
Champion Long Distance Cow of World
Her official record for 365 days is 27432.5 pounds of milk, and 998.26 pounds of butter fat.

LISTEN!

Regardless of age—regardless of breed—regardless of anything else—on the question of **feed** they **all agree.** These marvelous records, these unheard of performances were only made possible with **one and the same feed**—dependable **SCHUMACHER**—the record-making, record-breaking feed of all the world.

Schumacher Feed

is the feed of World's Champions because it's the feed that **makes** World's Champions. Every month, every year, somewhere, **SCHUMACHER FEED** is helping dairymen smash old World's records and setting up new ones. It is **the one feed for all breeds**—the one dairy ration which men who know **always** tie to in any record-making test.

Surely the feed that has proven **best** for the **best** cows in all the world, is **best** for you. If you have never tried **SCHUMACHER** we urge you to try the following—a feeding plan that has done more to make dairying profitable than all others combined.

Try This Feeding Plan Now

Mix three parts of **SCHUMACHER** with one part of any good high protein concentrate you are now feeding—such as Gluten, Cottonseed Meal, Distillers' Grains, Oil Meal, Malt Sprouts, Blue Ribbon Dairy Feed, and note the results. You will be surprised at the way your cows will lick it up eagerly—thrive on it—improve in condition—and increase their milk yield. **SCHUMACHER** contains that variety of grain products which you know are so essential and which give that stamina so necessary to withstand the strain of heavy milking. The **SCHUMACHER PLAN** of feeding will increase your dairy profits, make every cow improve her record and cut down your feed bills, too. Try it. Get it at your dealers.

Gentlemen:—Replying to yours of the 3rd, we are making **Schumacher Feed** one-third part of our herd ration and we are getting results. Several of our cows are milking up to over 75 lbs. per day with this part of our grain ration.

Yours very truly,
W. J. GILLETT,
Rosendale, Wis.

(26)

Auchenbrain Brown Kate 4th
World's Champion Ayrshire Cow
She gave during the year 23,022 pounds of milk or 10,820 quarts at a cost of less than 1¾ cents a quart, making an income from her milk, above cost of feed consumed of $541.

Read!

Narberth, Pa.,
December 6, 1913.

The Quaker Oats Company,
Chicago, Ill.

Gentlemen:—We have been feeding your **Schumacher Stock Feed** to our Ayrshire and Jersey cows which are on test for Official Records, and like it mixed with other grains. Our World's Champion Ayrshire Cow, Auchenbrain Brown Kate 4th, who has just finished her year's work with a record of 23,022 lbs. milk and 1080 lbs. of butter, was fed **Schumacher Stock Feed** as part of her ration. We find that **Schumacher Stock Feed** is one of the best feeds we have ever used in our mixtures

Yours very truly,
(Signed) E. S. Deubler, Superintendent, PENSHURST FARM.

Johanna DeKol Van Beers
The Second 40-Lb. Cow
60 days, milk 5,552.00 lbs., butter 290.00 lbs.; 90 days, milk 8,147.90 lbs., butter 418.13 lbs.; 100 days, milk 8,987.40 lbs., butter 460.19 lbs.; 120 days, milk 10,490.00 lbs., butter 540.97 lbs.; 7 Day Record, milk 663.00 lbs., butter 40.32 lbs.

Read!

Brookline Farm,
Dec. 8, 1913.

The Quaker Oats Co.,
Chicago, Ill.

Regarding **Schumacher Stock Feed,** will say as a feed for dairy cows or young cattle I know of no feed equal to **Schumacher.** It certainly contains all the ingredients necessary to put the finish and gloss on an animal and more than that the results obtained through the pail makes it the cheapest feed that I have ever fed. Johanna, in fact all my cows are fed every day a ration of **Schumacher Feed.** To any one feeding cattle for show, I would especially recommend **Schumacher.**

Yours truly,
T. E. GETZELMAN, Prop., Hampshire, Ill.

Read Also What the Man Who Raised Johanna DeKol Van Beers Says:

"We have been feeding **Schumacher Feed** for a number of years and ordered another car for part of our grain ration this year and like it very much. We raised the cow Johanna DeKol Van Beers, (the world's second 40-lb. cow) that was sold for $7000.00, and also the heifer Cedar Lawn DeKol Johanna that made 25 lbs. butter in 7 days, 707.93 lbs. in 365 days, at 2 years, 2 months of age. Hoping that you can always supply us with feed."

Yours truly, C. A. SCHROEDER & SON, per H. F. Schroeder, West Bend, Wis.

CAN A COW HOLD UP HER MILK?

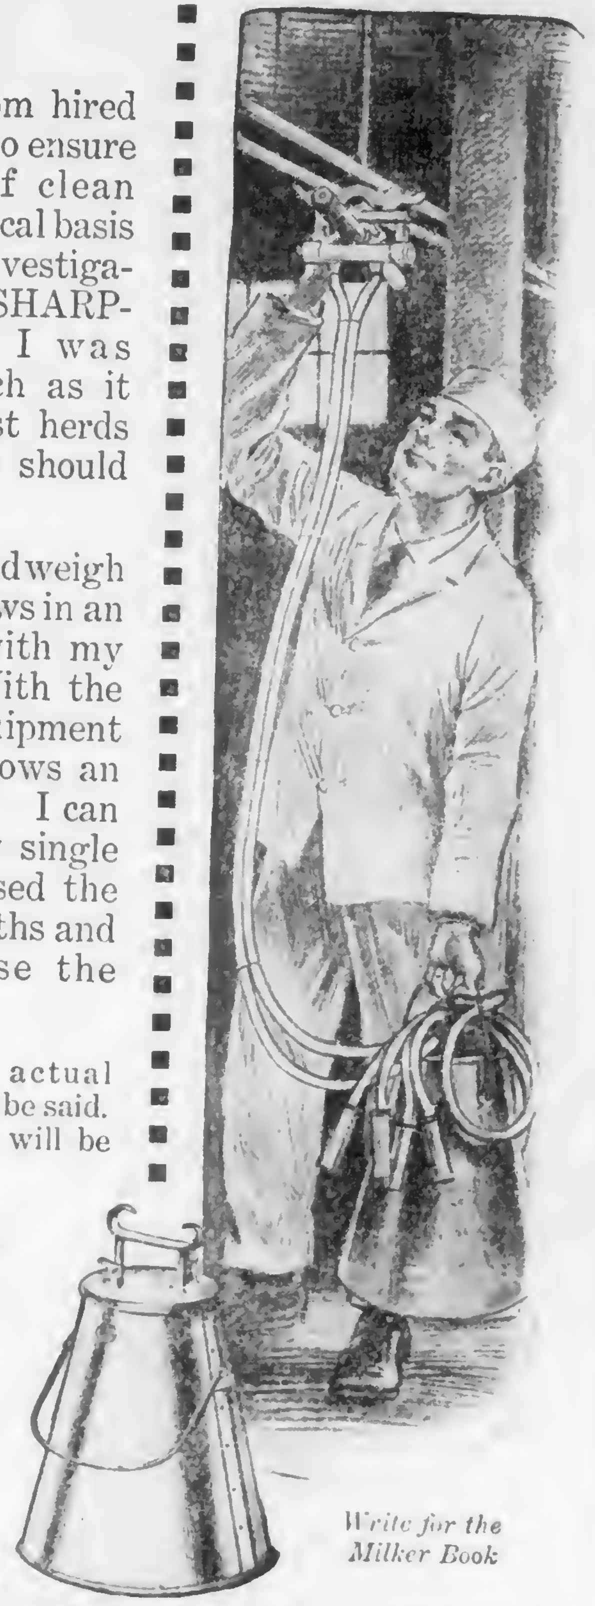
Is it true or not that a cow can hold up her milk at her own will? I have one with her second calf and it bothers me greatly to get her milk. When it does start she cringes, shakes her head and acts very uneasy. She has been in milk about four months and this season I fattened the calf by letting it suck the cow. Now is there any remedy? I fear she will dry up entirely.—W. H. M.

The question is practically answered in the letter, because this cow does hold back her milk and, as a matter of fact, every cow can largely control her flow of milk. The cow gives milk simply from the desire of nourishing her calf. She doesn't give it for the fun of it, nor because she is obliged to particularly. Of course nature provides that when a cow first freshens, or any other female for that matter, a certain amount of milk must flow, but unless proper conditions are provided the cow will go dry in a short time, and sometimes the milk flow never starts at all.

In this particular instance I think the difficulty was brought by having the calf suck the cow too long. She got accustomed to having the calf suck her and undoubtedly, since she cringes when she is being milked, her teats got sore or chapped. The calf leaves the teats wet and, if the cow is exposed to a cold dry wind, the teats will chap; then when she is being milked it hurts. It is probably not a pleasant sensation for a cow with sore teats to have them squeezed hard enough to get the milk out, consequently she does not relish the job and she holds up her milk. I would never let a calf suck a cow that I intended to milk more than one or two times; then take the calf away. Let it suck once or twice to get the first milk of the cow, because this is essential to the health of the calf. After that the calf is better off if you teach it to drink and the cow is milked. The cow is a great deal better off because she at onces becomes accustomed to hand milking. Almost invariably, if you let a calf suck a cow four or five weeks, there is trouble in getting the cow to give down her milk when you begin to milk her by hand. This is especially true with a young cow.

The proper thing to do in this particular case is to get some linseed oil or an ointment of some sort and apply to teats to take the soreness out and heal up the cracks or chaps. This will help out very much. Then by being careful with the cow and coaxing her a little, getting on the right side of her by getting her confidence as much as possible, you can, by persistent work, get her to give down her milk and gradually increase the yield until she gets up to a normal flow. No one yet has ever succeeded in getting a cow to give a liberal flow of milk by trying to force it from her. It can't be done. The cow refuses to give down her milk as the saying is, and will eventually dry up if you don't get her confidence.

The better a cow is used, the more gentle you are with her, the more you coax her, the more you teach her to like you, the more readily will she give down her milk and the larger yield will she give. This is one reason why the milking machine is sometimes said to be inferior to the good milker. It is, but there are really few good milkers. The milking machine does not hurt, and the cows give down their milk without being in any way distressed by the operation, while some hand milkers do hurt cows cruelly. The milking machine is better than a poor man, but a real good man is better than a milking machine.—C. C. L.



SHARPLES MILKER

The Modern Way In Dairying

"To get away from hired help troubles and to ensure the production of clean milk on an economical basis I decided, after investigation, to put in the SHARPLES MILKER. I was convinced inasmuch as it is milking the best herds in the country, it should be worth a trial.

"I can milk, strip and weigh the milk from 25 cows in an hour and a half with my two-unit outfit. With the regular one-man equipment of three units 30 cows an hour can be milked. I can do this work easily single handed. I have used the machine seven months and intend to increase the equipment."

Such endorsement by actual users says all that need be said. The name of this user will be furnished on request.

LAMBS WITHOUT GRAIN

I spent a year in northern Pennsylvania, and from memory of conditions there as well as from what I have since read, it seems to me that it is an excellent sheep country. I believe that for raising sheep the locality and conditions are far superior to our own in the corn-belt.

The internal parasite is the bane of the shepherd in this latitude. Eternal vigilance must be exercised to keep the ewe flock vigorous, and actual prevention is the only thing that can avert much loss of lambs in many flocks. I find that lambs may be dropped much later in northern latitude and yet thrive and attain good weight ahead of our early-dropped lambs. I believe that the absence of corn in large amounts on your farms need cause no positive hindrance to profitable production of native lambs. I know of cases in Pennsylvania where farmers have acquired quite satisfactory grazing land for $5 to $10 per acre. Yours is an excellent oats country. Stock farming with a little lime will put the land to raising clover where it may not now thrive.

The relatively greater profits to be had in hog raising make sheep a doubtful adjunct in our farming; but we require some live stock to work up our clover hay, some fodder, and pasture lands not desirable for plow purposes. We have been able to maintain our flock of 100 grade Shropshire ewes on grass until January 1 each year, and by sorting for vigor and condition need feed little until February. During the next three months we feed corn and oats moderately, as our lambs are dropped during March.

All sheep and lambs go to pasture early in May. We wean the lambs in August (early). Our flock of 90 lambs this season was given half a bushel of oats twice a day for a fortnight after weaning, to start them, and to get them to form a habit of coming to water. We fed no more grain until the middle of November, and not over 50 bushels before selling the lambs the middle of December at $7.25, averaging 92 pounds.

Our grain is more profitable when fed to other live stock, therefore we endeavor to make sheep and lambs the consumers of bulky feeds alone. The $775 that we receive from lambs and wool is largely to pay for that mass of bulky material that many are tempted to sell from the farm. Our lambs must be dropped early here or they will grow stunted and weak; we positively must not feed them grain or they grow too heavy before the price is restored after the range run. They graze our meadows and stubble fields, saving us the clipping, and attain plenty of size and flesh by the time we want them sold,—the grain consumed is slight.

You have cheap grazing land in northern Pennsylvania; you can raise much better oats than we can and you have the Buffalo market at hand. If dogs annoy, inclose your pastures with "wolf proof" fence, or the whole farm for that matter; for fence of some kind you must have. Let some enterprising man who has failed with sheep in northern Pennsylvania tell us why.—Geo. P. Williams, Delaware Co., Ohio.

CARE OF BROOD SOWS AND THEIR LITTERS

I have my brood sows farrow two litters of pigs per year. When a sow proves to be a profitable one she is generally kept for breeding purposes as long as she raises a litter of pigs successfully. In the summer and fall a dry pen and a little chaff are about all one needs to prepare for the sow at farrowing time. In the winter and early spring, a warm comfortable pen is also required, or many of the little pigs are likely to chill and die; especially if the sow farrows during a cold night with no one in attendance. Not many persons fancy sitting up with a sow during a cold night, but if the pigs are placed as fast as born in a small box in which a piece of old blanket is placed in the bottom, and another piece over the top until the pigs get dry, they are not likely to chill. Sometimes when the pen is very cold it is a good idea to take the box of pigs to the house and place beside the stove until dry. It pays to try and save as many pigs as possible when they bring the price they do now.

After farrowing, if the sow gets up and comes to the trough at feeding time, she is given a light slop the first day, generally about a half pail of separator milk and warm water, with a little bran put in. In winter, a warm slop is fed for several days after farrowing, and the grain ration, which generally consists of mixed ground grain and bran, half and half, is gradually increased until the sow gets about all she will clean up when the pigs are about four weeks old.—C. R. Weidle, Erie Co., Pa.

FITTING YEARLING WETHERS AND LAMBS FOR EXHIBITION

The high grado of animals sent to the various stock shows of the present day makes it imperative that special care be exercised in the fitting of stock for such purposes. To meet the need of information of this nature the Wisconsin Experiment Station at Madison, Wis., has issued its Bulletin No. 232 under the above heading, which of course, deals only with sheep and lambs but treats the subject thoroly.

Horses, Mules & Cows Should be CLIPPED

They are healthier and give better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better, get more good from their feed and are better in every way. Horses and mules take on new life and energy when clipped and naturally work better. Clipping the flanks and udders of cows prevents the dropping of filth into the milk. The best and most generally used clipper is the Stewart Ball-Bearing Clipping Machine, the only machine that can be used on horses, mules and cows without change. It turns easier, clips faster and closer and stays sharp longer than any other. Gears are all file hard and cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade.

Price $7.50 Get one from your dealer or send us $2.00 and we will ship C. O. D. for balance. Your money and transportation charges returned if you are not satisfied.

FEEDING MOLASSES

Every farmer should have a barrel of Empire Feeding Molasses and feed it to every animal at the rate of one pound of molasses to ten pounds of feed. A barrel weighs 700 pounds and supplies a digestive ferment which will increase the digestibility of 7,000 pounds of grain, hay or roughage. More than this, it makes poor roughage as palatable as the choicest clover hay. This increased value is secured without one penny of expense, because the molasses in itself, contains a food value greater than its cost. This feed is endorsed by the highest authorities and is now used by many big feeders. The price is $7.00 per barrel, (56 gallons) f. o. b. Pennsylvania Factory. Order a barrel today. If you are not satisfied after feeding half of it, tell us so and we will refund your $7.00. Write Wattles & Company, Sole Distributors, Box 22 Litchfield, Michigan.

20 cents per agate-line measurement, or $2.80 per inch (14 lines per inch) each insertion.
No advertisement inserted for less than 60 cents per insertion.
No deceptive, immoral or swindling advertisements inserted at any price.

Philadelphia, Pa., March 7, 1914.

Platform Issues

Political parties and prospective candidates are now busy formulating party platforms and evolving "vital issues" upon which candidates for state office will be selected at the coming primary election. Meanwhile the common people to whose "call" the candidates are so unselfishly responding and in whose "interest" the campaign issues are being defined, are setting back and merely awaiting results. Next winter, after the officials are securely in office, the common people will discover a large list of needs and desires, and will storm and bluster and "demand" consideration. They will receive just the kind of consideration they have received in the past and just the kind they will continue to receive so long as they wait until after the election before pressing their demands. The time to secure consideration from a candidate is while he is still a candidate, and while he feels the need of the support of the voters to secure election. Pennsylvania is in position to elect a state legislature at the next election that will be peculiarly responsive to the will of the people. The break in the dominant party has developed a condition in which all parties are striving to get closer to the rank and file of their constituents. With three parties contending for office there is going to be greater effort to get down to the actual needs of the people. There are a number of important state issues that will be of general interest to all classes in the next state election. There promises to be several that ought to be of particular interest to farmers. The liquor question promises to be one of the primary issues. This has come to be generally recognized as an economic as well as a moral question, and as such should be under control of local communities rather than the state. Local option, with district option in cities has proved so eminently successful in controling the problem from an economic standpoint, and is so just to all interested parties that it can scarcely be questioned as a thoroly practical solution of the problem. A second issue of general, state-wide interest, but of particular interest to farmers, is a reform system of state appropriations. The state has an income sufficient to meet all reasonable demands for support of public works and state institutions, but because of haphazard methods of making appropriations is under the necessity of curtailing support of needed work. A reform installing a systematic method for appropriations for charities is needed and should be provided at the next session of the state legislature. A special article dealing with the need of such reform will be published in an early issue of Pennsylvania Farmer. State participation in road building is by no means a settled policy. There is widespread dissatisfaction with the way road work has been handled, and a growing conviction that our present state highway organization costs too much money for the work accomplished. Whether the situation demands additional legislation or a reorganization of the department for more efficient work under the present laws must be decided in an early session, and farmers should impress their demands upon the candidates early. Both producers and consumers of food products feel the need of a reasonable control of the produce commission business. Legislation on this feature was squelched in the last session largely because of lack of proper support. Farmers should take this matter up early this year and be prepared to press their needs. These issues should all be discussed in farmers' gatherings and preparation made for some sort of concerted action. These columns are open for the expression of opinion at any time. The main thing is to know what we want as farmers and tax payers, and then go after it.

Home-mixed Fertilizers

The article on page 2 of this issue gives directions for home mixing of fertilizers. The practice of home mixing has been growing in some sections in recent years. Many farmers prefer to mix their own goods for special purposes and to secure combinations of fertilizing elements not offered on the fertilizer market. It is an important indication of progress in study and knowledge of the needs of the soil when farmers begin to interest themselves in the composition of the fertilizers they apply. More fertilizers will be purchased and all of it will be used more intelligently when farmers in general acquire a better knowledge of goods used. The farmer who will go to the trouble of making up his own combinations will also study soil needs and compare results from different mixtures and be able to select fertilizers and apply them more intelligently for future needs. Whether or not there is an actual saving in home-mixing of fertilizers is a question which each farmer must decide for himself according to his local conditions, his knowledge of mixing and his ability to secure the desired combinations from the raw materials available. Comparative tests with small quantities of home-mixed and commercial brands will reveal to each farmer whether or not he can profit by home mixing. It is probable that some farmers will find an actual advantage in home mixing. It is also probable that many others will find that they are giving time and labor to work which is uncertain in its results and paying slight profit on the time spent. There is no better way of determining this for the individual case than by making a small test. We know of farmers who mix their own fertilizers regularly and claim a profit thru the practice. We know of others who have given the home-mixed goods a trial of several years and have returned to the commercial brands. The invariable result of home mixing is a keener discrimination between low and high-grade goods, and the purchase of fertilizers by analysis rather than brand name. The actual contents of available fertilizing elements is the important feature in any grade of fertilizer, whether purchased or compounded at home. The more thoroly this is understood, and the more conscientiously it is followed in the purchase of goods, the greater will be the return from the use of all fertilizers.

PENNSYLVANIA CROP REPORT—1913

The first crop report to be put out by the State Department of Agriculture thru its newly created bureau of statistics will show that for 1913 Pennsylvania had 7,887,900 acres planted with the eight staples of rye, corn, potatoes, oats, buckwheat, hay, wheat and tobacco, and that there were 4,132,500 farm animals. These reports are to be issued yearly and are based on original returns made by county commissioners and crop reporters for the department, affording first hand information. The prices in various counties are also shown and there is an interesting statement on wages for each county. The crop report is as follows:

Crop	Acreage	Production	Av. yield acre	Value
Rye	280,000	4,900,000 bu.	17 bu.	$ 3,626,000
Corn	1,463,000	57,057,000 bu.	39 bu.	41,081,000
Potatoes	265,000	23,320,000 bu.	88 bu.	8,656,000
Oats	1,154,000	35,774,000 bu.	31 bu.	16,456,000
Buckwheat	280,000	5,180,000 bu.	18 bu.	3,781,000
Hay	3,141,000	4,146,000 bu.		61,775,000
Wheat	1,286,000	21,862,000 bu.	17 bu.	19,894,000
Tobacco	38,900	46,680,000 lb.	1200 lb.	3,601,000

The farm animal figures are as follows:

	Number	Value
Horses	584,000	$81,176,000
Mules	4,500	6,660,000
Milk cows	943,000	55,071,000
Other cattle	632,000	7,886,000
Sheep	839,000	4,111,000
Swine	1,130,000	15,594,000

STATE CAPITAL NEWS

The Liability Law.—Steps to secure consideration for the farmers point of view in regard to the employers' liability or workmen's compensation law draft which is to be submitted to the next legislature, have been taken by the Grange and a conference between the representatives of the Grangers and the members of the State Industrial Accidents Commission will probably be held in this city before April 1. The great objection to the bill as laid before the general assembly of 1913 was that it placed the farmer on the same plane as the Pennsylvania railroad or the United States Steel corporation. To all representations that it would be unfair to make the same provisions and scale of compensation for accidents apply the claim was made that exemption of any class would be unconstitutional. It is now intimated that the lawyers behind the compensation bill believe that some agreement can be made whereby the remuneration proposed by law to those killed or maimed in the great industries with their numerous hazards shall not apply to the farmer or small manufacturer, and that a bill which will care for those who suffer in the stress of modern manufacturing and not strike hard on the man who makes little more than a living for himself and his family can be framed.

As To Child Labor.—Similarly, no attention has been given to rural conditions in the discussion of legislation affecting the employment of children. There are times on the farm when every hand is needed from morning until night to save crops and it would be preposterous to make a fruit grower or farmer liable to a heavy fine when he found it necessary to employ every pair of hands he could find to save his crops, on a scale of hours exceeding that which legislators framed to meet conditions in a textile mill or a cigar factory which goes on the same rate the whole year round. Again, it has been pointed out that the average teacher in the country stays but a few years and that the issuance of certificates should be in the hands of the permanent school officials who know the community, the children and the conditions.

The Traction Engine.—In all fairness it should be stated that if the people who are condemning the regulations for the operation of traction engines and those who make the regulations could get together for an amicable talk it would do more toward straightening out the questions involved before the roads get in shape for engines to travel, than all the resolutions passed, the speeches made and the lawyers employed could accomplish. There is complaint that the regulations of the State Highway Department are too strict and that they will prevent engines traveling without such expensive precautions or appliances as would force owners to charge the farmers more for their services. On the other hand the department officers and some supervisors claim that the engines have cleats that tear up the roads. Two representatives of the traction engine makers and the highway commissioner had a conference the other day during which the makers' representatives made threats of law tests and the official retorted that of 224 traction engine owners who had taken out license but 3 had made protests.

Demonstrators.—The orchard demonstration work of the State will be started about March 15, if the weather permits. It is expected that it will be on a more extensive scale than formerly owing to the fact that five men have been added to the force in the field. As usual the demonstrators will begin in southern counties first and be extended to the northern tier.

State Aid Roads.—Highway Commissioner Bigelow has announced that this spring he will let contracts for probably a dozen road improvements under the State aid plan. Numerous applications for state aid have been made to the department and the plans and specifications are now being made. The funds for construction of roads by state aid are the only ones of any size available now.

National Road Aid.—While everyone is in favor of national aid for road building there is a decided disposition manifested for a system which will enable all districts to participate. The legislative committee of the State Grange favors an automatic basis, something like the State school appropriation, money spent to be audited and results obtained that will be lasting. Unfortunately, the experience of Pennsylvania has been that local authorities do not always give the best of care to maintenance and what is needed is a well founded system that will bring results. The present state system of piecemeal aid to townships and nominal aid in supervision pleases no one. Many folks favor repeal of the township road law of 1913, altho as yet it has not been fairly tried and can not be until legislators cease from caring for hospitals and charities which should be supported at home and devote money for public improvements in such amounts as can produce something tangible. Enough money has been frittered away in the name of good roads in Pennsylvania to lift many townships out of the mud.
